

AESOP 2025 CONGRESS

Istanbul, 7-11 July

PLANNING AS A TRANSFORMATIVE ACTION IN AN AGE OF PLANETARY CRISIS

BOOK OF ABSTRACTS

Colophon

Title

TRANSFORMATIVE ACTION IN AN AGE OF PLANETARY CRISIS

Subtitle

Book of Abstracts - AESOP Annual Congress 2025

Editors

Donato Casavola, Politecnico di Torino, IT
Frank van der Hoeven, TU Delft, NL
Ljiljana Radisavljević, University of Belgrade, RS

ISBN

9789464981841

Cover Design

Contents

Congress Opening Session	1
Urban Political Ecology: Prefigurative Planning for a Climate emergency . . .	1
Planning Istanbul in Hard Times with(out) Great Expectations	1
Keynote Speakers	2
Just Sustainabilities in Policy, Planning and Practice	2
The Paradoxical Potential of Interregnum: Exploring Opportunities for Transformative Planning in Times of Crisis	2
After Green Growth: Satiation As the Strategic Impulse for Spatial Planning	2
The green transition challenge. Social and environmental inequalities in housing	3
Networking Event	4
GPEAN Networking Event: Housing in the Global South –Challenges and Opportunities for Planning Education	4
Roundtable 1	5
CO-CREATING THE 15-MINUTE CITY - (Hosted within track 3: Mobility)	5
Roundtable 2	7
WHAT IS NEW IN COMPARATIVE INTERNATIONAL PLANNING: WHY, WHAT, AND HOW?	7
Roundtable 3	8
Rethinking Democratic Urban Planning: Reflecting on Equitable and Ethical Approaches for the Multi-Crisis Era	8
Roundtable 4	10
Radical alternatives to climate urbanism: towards socially and ecologically just cities	10
Roundtable 5	11
Circularity and/or Sustainability? Imagining Transformative Strategies and Actions for the Urban Transition	11
Roundtable 6	13
Learning through instituting. Impacts of civic action on institutions and the potential for the production of public value in planning	13
Roundtable 7	15
City-Making Beyond Crisis Management: Toward Just Urban Policies	15
Roundtable 8	17

Strategies for increasing heat resilience in cities –Where do we go from here in planning research and practice?	17
Roundtable 9	19
Integrating Digital Transition and Territorial Development: A Co-Evolutionary Approach	19
Roundtable 10	21
Urban Living Labs in Education –Hybrid and transformative settings for collaborative learning and research in cities and regions	21
Roundtable 11	22
ROUNDTABLE ON CO-PRODUCTION OF KNOWLEDGE FOR TRANSFORMATIVE ACTION –(Hosted within track 8: Education and Skill)	22
Roundtable 12	23
BEYOND THE PROCESS: DIFFICULTIES FOR THEORISATION WITHIN PLANNING RESEARCH AND PRACTICE –(Hosted within track 10: Theories) . .	23
Roundtable 13	25
FUNDAMENTAL? OR BEST FORGOTTEN? CONTEMPORARY PERSPECTIVES ON THE PUBLIC INTEREST	25
Roundtable 14	27
Project management in cross-border initiatives: practices, challenges and opportunities	27
Roundtable 15	28
Planning professionalism and re-building trust in a post-truth era	28
Roundtable 16	29
"Post-Growth, or The Return to the Fabulous Fifties? Evidence of Fundamental Contradictions between Theory and Practice of Planning	29
Roundtable 17	30
Demonstrating the Application of Digital Twins in Urban Planning: Ensuring Citizen Centric Impact	30
Roundtable 19	32
City, diversity and toleration: the legal and political geography of pluralism	32
Roundtable 20	33
AESOP-India Planning Exchange: Towards Global North-South relation in knowledge production	33
Roundtable 21	34
Coping with uncertainties and the poly-crisis within Europe: The Metropolitan arena	34
Roundtable 22	35
Living with water at the time of multi-risk conditions	35
Roundtable 23	36
Neighborhoods for Transformative Action	36

Roundtable 24	38
Has the pandemic boosted innovation? Exploring urban transition	38
Roundtable 25	39
UGoveRN: From Policy to Practice: Innovative Regulatory Tools for Addressing the Affordable Housing Crisis	39
Roundtable 26	41
AESOP Quality Recognition (QR) Programme: A European Planning Education Platform for Transformative Reflections, Learning and Action . . .	41
Roundtable 27	43
Transformations to post-growth –Positions, perspectives, and prospects for people and planet	43
Roundtable 28	44
Publishing Planning Research: A Conversation with Editors	44
Roundtable 29	45
‘CONVERSATIONS IN PLANNING THEORY AND PRACTICE’: A COLLABORATIVE E-PUBLICATION BY AESOP’S YOUNG ACADEMIC NETWORK	45
Roundtable 31	46
PLANNING, PUBLISHING AND THE PLANET: ACADEMIC PLANNING PUBLISHING IN TIMES OF PLANETARY CRISES	46
RTPI	47
WHAT ROLE SHOULD THE ROYAL TOWN PLANNING INSTITUTE AND OTHER PROFESSIONAL INSTITUTES PLAY IN SHAPING AND RESPONDING TO THE EMERGING EUROPEAN PLANNING RESEARCH AGENDA?	47
Special Session 1 PLANNING FOR JUST ENERGY TRANSITION	48
Pathways to Just Energy Transitions in Post-Conflict Ukrainian Cities	48
Positive Energy Districts as an Urban Project: Representation, Redistribution and Scale in Cureghem’s Just Energy Transition	49
Energy Justice in Underprivileged Neighbourhoods: Reimagining Energy Transitions Through Community Storytelling	50
Sacrifice zones of the EU’s just energy transition in transport –The case of Jadar - Serbian rural, biodiverse and lithium rich region	52
Planning for A Just Urban Energy Transition: A Phronetic Approach	53
Urban Regeneration-Energy Transition Nexus. Challenges from Multidimensional and Place-Based Approaches to Energy Justice	55
Fostering Local Inclusive Energy Transitions Through Innovation Communities	56
Special Session 2 DISCUSSING SPATIAL JUSTICE FROM/TOWARDS A SOCIO-ECOLOGICAL PERSPECTIVE	58
The case of the Old Town of Taranto and its post-disaster possible futures .	58
The words and operational tools of transition. On territorial systems	58
Public spaces in Rome: expanding the potential by reinterpreting old rules in a new framework	59
Pathways towards and interpretations of shared governance. Comparative notes on Brussels, Naples and Barcelona.	60
Nurturing More-than-human Relations in Contested Urban Spaces: Learning from Parco Terranostra	61

Discussing spatial justice at the intersection between migration and housing. The inclusion system in the inner regions of southern Italy	62
Unveiling spatial interdependencies between inland areas and urban poles for enhanced regional cohesion strategies	63
Energy Transitions as Socio-Ecological Urban Projects: Representation, Redistribution, and Scale in Cureghem's PED Strategies	64
A Community Out of the Box: Understanding Flexibility and Justice through Self-organised Housing in the Netherlands	64
Infrastructures, Inequalities, and Rights: The Sacco Valley in Italy's Intermediate Territories	66
Civic peri-urban: repositioning peri-urban urbanization in new forms of inter-generational co-ownership	67
MOTILITY as a lens to challenge the urban metabolism research agenda. Towards more just and sustainable cities	68
Water justice, scarcity and environmental flows. The case of Marseille	70
Uncovering the potential of community energy actions to cope with energy poverty in remote areas: a systematic literature review	71
UNFAIR PROXIMITY The coexistence of energy infrastructures in marginal territory, reemerging conflicts, unfair supply, and unbalanced governance	72
Ecological Strategies for Historic Center of Lima: Camaná Linear Park	73
Mobile Commons and spatial justice in the face of climate change on the North Adriatic coast	73
Brussels's not an island. A critical reflection on the places of multispecies spatial injustice	74
Re-mining Punta Corna. A Laboratory on the Local Impacts of the Critical Raw Material Act in the Alpine Region	75
Ecopublica: a tool for socio-ecological emancipation	76
Designing good life for all. Explorations on "fragile" neighbourhoods in Trieste	77
Special Session 3 REPOPULATING LEFT-BEHIND TERRITORIES: POLICIES, PRACTICES, AND EMERGING PATHWAY	79
Revitalizing the Po Valley's margins: challenges, strategies and future prospects	79
Attempting coproduction, (strategically) misunderstanding coproduction, failing coproduction? Motivations, positionalities, challenges and (concrete) experiences in coproduction processes on left-behind places in Lombardy, Italy	79
Infrastructuring repopulation. Regeneration of left-behind territories and construction of new housing practice.	80
Navigating (Im)mobility and alternative development in Left Behind Areas: Insights from Valle di Viù, Italy	81
Social Infrastructures for Repopulation: Learning from 'School Zones' in England	82
Special Session 4 PLANNING FOR TWIN TRANSITION IN REGIONAL AND URBAN SYSTEMS	83
Insights from Portugal's Solar Energy Transition in the framework of Cohesion Policy (2014—2020) implementation	83
Planning for Clean Transport: Role of Electric Vehicles and Hydrogen Energy in Urban and Regional Systems	83

Twin Tools of the Global to Local to Global Geodesign for Climate Change Mitigation Project	85
Teleworking in the EU Digital Transition Framework: Case-study of Portuguese Territories in Post-Covid Times	86
Special Session 5 SOCIAL ENTREPRENEURS: KEY AGENTS FOR SUSTAINABLE COMMUNITY-LED URBAN REGENERATION AND TERRITORIAL INNOVATION	88
Leveraging Social Entrepreneurship for Sustainable Urban Futures: Transforming Governance Through Grassroots Innovation	88
Community-driven processes, public funding, and social entrepreneurs in Italy's PNRR urban regeneration projects, a balancing act.	88
Socio-Spatial Innovation in Central and Eastern Europe: Insights from Regional Innovation Capacity Research (REGINNO)	89
Special Session 6 METROPOLITAN RESILIENCE: CHALLENGES, FIELDS OF ACTION AND ANSWERS	91
From complex adaptive systems to anti-fragility and social innovation: The notion of resilience in metropolitan spatial planning	91
Spatial Planning at a time of climate change: Dutch metropolis to Eurodelta Megaregion	91
It Takes a Metropolis and Even a Megalopolis to Become Resilient: Lessons from Bologna and Marmara	92
Spatial Planning and Metropolitan Governance to face flood risk in the new Climate Change context: A comparison between Eurodelta Megaregion and Valencia metropolitan area	93
Planning and Housing Policy: in defence of resilient metropolitan regions	94
Special Session 7 TURNING NATURE-BASED SOLUTIONS INTO INCLUSIVE CLIMATE ACTIONS	95
Lisbon's Urban Nature Imaginaries: rethinking values and meanings for a more inclusive urban transformation	95
An intersectional urban care framework for evaluating Nature-based Solutions	95
Literature review on inclusive Nature-based Solutions in Europe	96
Assessing the effectiveness of Nature-based Solutions as Inclusive Climate Actions: a case study from Torino, Italy	96
How equitable and inclusive is the green space strategic planning in Romania?	97
Special Session 8 TRANSFORMATIVE PLANNING ACTIONS FROM THE SOUTH: NEGOTIATING THE PAST FOR ALTERNATIVE FUTURES	99
Modern, Restorative, Sustainable? Examining Neo-colonial Urbanism and Commons in the Global South	99
Decolonial Strategies for Urban Greenery –Initiating Change in Urban Landscapes	99
Beyond Erasure: Alternative Understandings of Colonial Legacies in Urban and Rural Spaces	100
Special Session 9 GOVERNING THE “CARBON NEUTRAL CITY”: BARRIERS AND ENABLERS FOR AN INTEGRATED CLIMATE GOVERNANCE IN CITIES	102
Digital tools for smart decision-making towards carbon neutrality	102
Accounting beyond boundaries: Exploring consumption-based carbon approaches in Paris and Gothenburg	102

Exploring the feasibility of climate actions: what guides adaptation implementation in Europe?	104
Urban Carbon Emission Data	105

Special Session 10 | SHAPING REGIONAL FUTURES TOWARD SUSTAINABLE TRANSITIONS: COMMUNITY INVOLVMENT IN VISIONING AND IMPLEMENTATION 106

ASSETs for circular futures: boosting the transition to circular construction in the Eurodelta	106
GIVING OPERATIONALITY TO STRATEGIC PLANNING: FROM THE VISION 2030 TO THE TERRITORIAL PLAN OF THE METROPOLITAN CITY OF FLORENCE	106
UNDERSTANDING THE ROLE OF WATER DATA SPACE IMAGINARIES IN ACCELERATING TWIN (GREEN AND DIGITAL) TRANSITION PATHWAYS FOR THE WATER MULTIVERSE	107
Enacting Istanbul Vision 2050: Addressing Key Urban Challenges Through Participatory and Multi-Scale Planning	108
Navigating Lusatia's Structural Transition Between Consensus and Dissensus	110
MAPPING COMMUNITY PERSPECTIVES FOR CO-DESIGNING REGIONAL SUSTAINABILITY TRANSITIONS	111
Navigating Regional Challenges: Food Systems as a Catalyst for Spatial Planning Innovation - The Food Transition Strategy and FoodLink Network in the Metropolitan Area of Lisbon	112
"Co-Visioning" Urban-Rural Futures: Testing a participative and integrated regional planning approach in Germany and China	113

Special Session 11 | THE VALUE AND ROLE OF DESIGN IN PLANNING EDUCATION 114

Revisiting the art of town planning: what can archives teach us about the pedagogy of design?	114
Teaching Planning Without Planning Schools: Challenges from Central America	114
Urban design content in planning curricula –an international comparison of the UK and Germany	115
Urban Development and Design Pedagogy at the University of New South Wales, Sydney –a critical reflection	116
Designing for Sustainability: Interdisciplinary Urban Planning Education Strategies in Norway	117
Design in Urban Planning Education: An Interdisciplinary Studio Approach	118
Design thinking and designing as collaborative competencies in planning education	119
Who teaches urban design to planners in Poland? Challenges for planning curricula and implications for urban space	120
Teaching Design to Planners: pedagogical approaches from the UK	121
Urban Design Studios and Service-Learning in Planning Education	122

Special Session 12 | RETHINKING ACCESSIBILITY IN THE 15-MINUTE CITY: GLOBAL PROJECT INSIGHTS 124

Evaluating the 15-Minute City Concept in Ankara: Resident Perceptions of Accessibility in Çankaya and Keçiören	124
Positive and Normative dimensions of accessibility by proximity for supporting a fair and sustainable 15 min city model	124
Exploring walking accessibility to urban services at several spatial scales: insights from five European cities	125
The supply structures of shared mobility services and emerging access issues in marginalised communities	126

Integrating urban complexity into accessibility planning: Towards a people-centred and place-based approach to reach the objectives of the 15-minute city across diverse urban forms	127
Special Session 13 ENHANCING URBAN DECISION-MAKING IN THE DIGITAL ERA: TOOLS, METHODS, AND INNOVATIONS	129
Supporting the urban decision-making through a “GLOcal knowledge-System for the Sustainable Assessment of urban projects”	129
A More Than Human Approach to Landscape Storytelling and Planning: Interactions Between AI and Problem Structuring Methods	130
Assessment of Climate Change Adaptability and Risk based on open data: The Case of Italy	132
How does software support decision-making processes in the group dynamic?	133
Special Session 14 TRANSFORMING STREETS FOR LIVEABILITY AND SUSTAINABLE MOBILITY THROUGH EXPERIMENTATION AND PARTICIPATION	135
Multi-stakeholder perspective in participatory street experiments	135
Translating street experiments into policy change: Tactical micromobility transformation in Istanbul	136
Achieving transformation through involvement and evidence? Reflecting street experiments’impact on planning processes	137
Transforming urban spaces: The role of play and recreation in creating a thriving Istanbul	138
Playful approaches to street transformation	139
Narrative-based approaches to street transformation	140
Special Session 15 REVERSING THE GAZE: REIMAGINING THE RELATIONSHIP BETWEEN CITIES AND THEIR WATERWAYS	141
Water-Sensitive City: Enhancing River-Centered Planning Strategies in Turin	141
In order for co-existing, in a just way, with the excess of water in a small favela	141
Unfolding water interfaces: water between urban infrastructure and culture	142
Visualising the Terrain for Water Resilience: A methodology to visualise and communicate the systemic effects of design interventions in a water system.	143
Special Session 16 SMALL TOWNS -BIG CHALLENGES AND HIGH POTENTIALS?	144
Small town inner-city centres –cases from Germany. Insights from research on processes, concepts, tools	144
Urban-systematic-quantitative analysis of metropolitan functions in small towns	144
Knowledge Economy in Germany - Small Towns in the Shadow of Large Cities?	145
New planning tools and project opportunities towards a more sustainable revitalization of very small settlements and local communities in peripheral territories	146
On the subject of a ‘revenge’for small towns, based on the French example	147
Special Session 17 PERSPECTIVES ON COMMONING MOBILITY AND ACCESSIBILITY	149
Commoning Accessibility: Reframing Accessibility as a Common Good . . .	149
Commoning mobility knowledge	150

Commoning for post-growth mobilities? A critical perspective on two rail-way cooperatives	150
Understanding Commoning Accessibility in the Context of the European Welfare State	151
Special Session 18 SMART CITY AS A TRANSFORMATIVE APPROACH? CONCEPTUALIZING DIGITAL TOOLS IN SPATIAL DEVELOPMENT IN A CONTEXT OF AGEING	152
Utilisation and evaluation of activity opportunities by baby boomers. Challenges in rural, suburban and urban areas	152
Smart cities and transformative action: Conceptualizing smart cities for an ageing society in the Japanese planning culture	152
Decision support systems as a tool for better comprehensive planning . . .	153
Smart regions in an ageing society - new challenges for spatial planning in relation to healthcare	155
Identifying climate-active green spaces with the help of artificial intelligence	156
Ageing smart: A DSS for municipal health planning in an ageing society . . .	156
Special Session 19 CONTESTED ISTANBUL: URBAN DEVELOPMENT AND PLANNING CONFLICTS IN TURKEY'S 'ASPIRING GLOBAL CITY'	159
Exploring the Expropriation of an Urban Space through Lefebvre's Theory of the Production of space: The Case of Gezi Park (İstanbul)	159
Urban Conflicts and Movements in Istanbul from the Perspective of an Urban Citizen	159
Gendered Geographies of Fear and Urban Resistance in Istanbul: "Invisible No More!"	160
Urban politics in "Post-Gezi" Istanbul and Beyond: Urban redevelopment, grassroots politics and mobilizations	160
Special Session 20 CHANGING THE STREET-SET: FROM TACTICS TO STRATEGIES, FROM STREETS TO CITIES AND BEYOND	162
Rehearsal to Permanent: Transforming Urban Area Using Tactical Urbanism as a Tool	162
Up-Scaling Safe School Streets at the District Level: Programming for Üsküdar	162
Reclaiming Streets for Children, Communities, and Climate: Regional Learning Circles Driving Change	163
Designing Safer School Zones: Bridging Immediate Needs and Long-Term Urban Solutions	165
Special Session 21 INNOVATING PLANNING EDUCATION IN THE AGE OF AI EMERGENCE	166
The age of Artificial Intelligence and education with humanism	166
Positive Energy Districts, Energy Communities and AI: Synergies, Contrasts, and Benefits for Urban Energy Systems and Areas	166
Innovating Planning Education in the Age of AI: Bridging Technology and Urban Futures	168
Innovating Planning Education in the Age of AI Emergence	168
Pioneering Intelligent Design for Future Cities	169
Track 1 POSTGROWTH URBANISM	170
Community ownership for degrowth	170
To Transport or not to Transport: Post-Growth Propositions for Transport Infrastructure Planning	170
Ecopolis. What does a post-growth city may look like?	171

Planning for conviviality	172
Restoring socio-ecological balance in City-Port Areas. A conceptual framework for a circular and sustainable regeneration of coastal wastescapes integrating Nature-Based Solutions	173
Urban Metabolic Risk: Rethinking Circular Urban Metabolism for Sustainable Regeneration Processes	175
Post-growth Redefinition of Urban Textures: The Changing Faces of Human Scale through Eminonu and Maslak Central Business Areas in Istanbul	176
Post-Growth Paradigms Underpinning the Socio-Technical Transformation of Services: An Analysis of Three Municipal Planning Strategies in the Atlantic Region	177
Reconfiguring Underutilised Spaces: A Conceptual Framework for Advancing Spatial Circularity in London	178
Toward New Circular Urban Economies: Regeneration Models for the Ecological Transition of Cities. European Cases and Initiatives.	180
Navigating Regional Gaps, Cohesion Policy, and Geostrategic Security: Balancing Estonia's Urban System	181
Towards the understanding of the energetic bases of spatial dynamics: an introduction for postgrowth planning	182
Towards post-growth cities: the cultural politics of mobility transitions in Barcelona and London	184
Community-based Street Greening: A Postgrowth Approach to Resilient and Healthy Cities	184
IS GDP EVERYTHING? ANALYZING GDP EFFECT ON DEVELOPMENT FOR TÜRKİYE PROVINCES.	185
Deprivation Analysis in Turkey and Its Provinces: Insights for Post-Growth Urbanism	186
The Circular Economy of Cities and Regions: Towards a Critical Spatial Perspective	187
Twisting the loop: 'Patchworking' local value regimes toward a circular economy	189
Designing Degrowth Within: Keeping or Leaving River Burials, Which Costs More?	189
Beyond climate change. Retreat susceptibility of the Italian urbanised coastlines	190
Creative Hubs in Transition: NGBG and the Role of Creative Hubs in Post-Growth Urban Transformation	191
Conscious shrinkage	192
Collaboration Beyond Growth? Possibilities for Innovative Adaptive Governance in Metro-Boston	194
Land Consumption vs. Population Decline: Evaluating Poland's Spatial Planning Strategies in Medium-Sized Cities	195
Wellbeing and New Urban Regeneration Agendas in China: Insights from Shanghai	196
Imagining the Post-. Can Multispecies Urbanism be a Track for Radical Change? The case of Brussels	197
Alto Medio Sannio inner area between marginality, latent place knowledge and territorial heritage	198
RURAL TRANSFORMATION AS A RESULT OF COUNTER-URBANIZATION DURING AND AFTER THE COVID-19 PANDEMIC PROCESS IN İZMİR-SEFERİHİSAR	199
Perceptual Encounters with the Urbanization of Nature	201

Post growth and Being. What is envisaged for human being in a post-growth world.	202
Emerging conflicts between infrastructure-based development strategies and post-growth tendencies. The case of transport acceleration projects in the Salento region, Italy	203
ADDRESSING SOCIO-ENVIRONMENTAL PROBLEMS BY INTEGRATING BIO-DIVERSITY IMPACT CHAIN ANALYSIS INTO PLANNING: THE CASE OF MOUNT IDA, TURKEY	204
Rethinking Urban Sprawl in the Context of Shrinking Cities: A Critical Review of Shrinkage Sprawl and Its Spatial Implications	205
Planning the Great Acceleration: Contributions of planning theory, ideology, and implementation to planetary transformation and social-ecological decline	206
Urban Heritage Conservation: A Turn to Post-Growth Planning in China?	208
Toward Integrated Planning for Circular Development in Cities: Insights from Literature and Chinese Policy	209
A new vocabulary for postgrowth transition in planning	210
Degrowth's identity problem: the regional politics of Vienna's 'breadbasket'	211
The Global Journey of Second-Hand Clothing: Key Actors and Local Dynamics	212

Track 2 | PLANNING AND LAW

213

Operationalising adaptive planning in regulatory planning systems: Balancing Rigidity and Flexibility in Oude Dokken, Ghent	213
Comparison of Retrofitting and Urban Renewal Processes in terms of Transaction Costs and Value Increase Effects: Case Study in Kadıköy	214
Exploring the Challenges of Integrating Nature-Based Solutions into Urban Planning Statutory Systems: A Case Study of Kaohsiung City, Taiwan	215
NAVIGATING UNCERTAINTY: THE ROLE OF PLANNING IN ISTANBUL'S BAG-CILAR INDUSTRIAL DISTRICT	217
Suburban Densification: Space, Strategies, and Land Policy	218
Post-socialist and Western housing policies for densifying suburbia -Understanding and comparing German and Czech perspective	218
Soil Consumption and Logistics Hubs: Castel San Giovanni, the Milan Logistic Region's Gateway to Emilia-Romagna	219
Study on the current status and issues of urban regeneration development in Yokohama City	220
Future Zones: Legal Innovations for Adaptive and Equitable Spatial Development	221
The relationship between urban planning and crisis management from the perspective of legal instruments in Poland.	222
How and why do municipalities regulate urban environments: Comparison across Europe	223
A Policy Approach to the Use of Retrofitting in the Turkish Planning System	224
EXAMINING THE EFFECTS OF SHORT-TERM RENTAL REGULATIONS: THE INS AND OUTS OF ISTANBUL	226
Legal Pathways for Urban Mobility Resilience: A Content Analysis of Policy Documents for Istanbul's Transport Systems	227
Nature and legal framework of the Privately Managed Public Spaces: opportunity or risk for a just city? The case of Milan	228
Land ownership and cultural landscape patterns A case study of the Upper Horehronie, Slovakia	229

Climate adaptation in multi-level legal and planning policy frameworks: using spatial justice to identify barriers to meaningful implementation	230
The role of planning law in regulating urban ventilation: The case of Poland	231
Suing Like a City: How plaintiff cities pursue climate litigation against the state and corporations	232
Local governments' strategies of linking affordable housing with urban village redevelopment in China: Reallocating property rights	233
Use of New Municipal Fiscal Powers for Sustainable Urban Development: Development and Application of a Strategic Financial Planning Method in the City of Mascouche, Québec (Canada)	233
No net land take? A uniform European policy but varying regulations and property rights	234
Land Policies in Europe - Land-use planning, property rights, and spatial development	235
Law as a Catalyst for Change in Water Supply Policies in Brazil: The Debate on the National Law for Social Water Tariffs	237
Anticipatory politicization management: the case of No Net Land Take	238
The Impact on the Assessment of the Urban Silhouette and Aesthetics of the Socio-Political Context: A Case Study of Istanbul	239
The Rule of law in the planning system –a view on the Global South	240

Track 3 | MOBILITY **242**

Urban Vitality in Motion	242
Positive and Normative dimensions of accessibility by proximity for supporting a fair and sustainable 15 min city model	242
Interpretable Spatial Machine Learning Insights into the Impact of Built Environment on Intercity Commuting	243
Impact of Multi-Station Aggregate Hub Redevelopment on Surrounding Urban Areas: A Case Study of London's King's Cross	244
ENHANCING URBAN SEA TRANSPORTATION THROUGH WALKABILITY AND MICROMOBILITY INTEGRATION WITH FERRY TERMINALS	246
Understanding Mobility and Activity in the Low Traffic Neighbourhood: The Case of East Oxford, UK.	247
Beyond the ride: A bike along study on infrastructural factors and determinants influencing the docked bike-sharing experience	248
Can proximity forge strong bonds? Exploring the relationship between urban proximity and social cohesion at the neighbourhood level	250
Research on Urban Slow Traffic Network Construction Based on the "Patch-Corridor-Matrix" Model	251
"Beyond Growth" in China: Coordinated Optimization Strategies for Rail Transit Networks and Regional Spatial Structure in the Post-Urbanization Context	253
The role of New Working Spaces in the context of the 15-minute city: insights from Greek case studies	254
Daily Mobility and Public Open Space in Large-scale Housing Estates: Connection and Social Networking Quality in a 15-minute City Concept	256
Advancing the '15-Minute City' in Turkey: A Framework for Sustainable Urban Planning and Governance in Mid-Sized Turkish Cities	257
Are local living and transit-oriented development compatible? Conundrums in land use and transport integration policies in the transformation of Australian cities.	259

Exploring Interactions between Urban Rail Transit Network Characteristics and Station-Area Functional Morphology: A Typological Analysis and Flow Prediction of Shanghai Metro Based on Multi-Source Data	260
Tactical urbanism, accessibility, and public participation: a mixed-method research and practice in Genoa, Italy	261
Barcelona's Superblocks: from grid to block. The iterative design and implementation process of an urban planning concept.	263
Revisiting Functional Density: Balancing Proximity and Hub-Based Mobility in the Seoul Metropolitan Region, South Korea	264
Off the Beaten Track: Uncovering Rural Voices in the Conflict over the Future of Cycling in Bavaria	265
The 15-minute city center: A comparative analysis of the cities of Thessaloniki and Hanover.	267
Identifying intermediate territories through mobility patterns	268
GenAI Street Experiments: Introducing a Critical Framework for Generative Artificial Intelligence in Urban Design Teaching	269
Assessing the Impact of Urban Rail Transit on Urban Vitality: A Big-Data-Based Approach	270
Assessing Urban Mobility Resilience: The Combined Impact of Physical and Socio-Economic Systems on Bike-Sharing in Extreme Heat	271
Why Cycle Through Rain and Wind? A retrospective exploration of behaviors, attitudes, and habits.	273
Who lives (in) the 15-min city? Sociodemographic insights into the 15-minute lifestyle in Barcelona.	274
The walkability potential matrix –a new method for measuring walkability potentials in town and city centres	275
Planning that contributes to more utilitarian walking: The context of a Norwegian 'small city'	276
Urban freight mobility modes recognition classification and inclusive freight policy exploration based on truck trajectory data: A case study of Shanghai, China	277
Framing micromobility in Flanders (Belgium): an exploratory discourse analysis	278
Data-driven prioritising of pedestrian-oriented infrastructure: A framework for resources allocation	279
Urban Rail Transit Usage in Developing Countries: The Case of Istanbul	281
Urban Canopy and Walking Behaviour	282
Superblocks and Electoral Outcomes: Examining Local and Spatial Spillovers in Barcelona	282
TRANSPORT INFRASTRUCTURES, SHARED MOBILITY AND PUBLIC SPACES – THE URBAN DESIGN FOR MOBILITY HUBS	284
Proximity as a conceptual lens. The growing recognition of proximity planning	285
Socioeconomic Disparities in Daily Activity Spaces: Insights from Smartphone Mobility Data on Non-Commuting Trips	286
Evaluation of european tram systems: a GIS-based quantitative approach	288
The operationalization and implementation potential of x-minute city policies across the globe: A review of the literature	289
Reshaping Metropolitan TOD Corridor: The Impacts of Shanghai-Suzhou Intercity Rail Transit on Travel Behavior Along the Corridor	290
Shaping Pedestrian Mobility: Exploring Urban and Spatial Features of Cendere Valley, Kagithane	291

Analysis of Regional Disparities in Public Transportation Accessibility: A Spatial Approach Based on Equal-Time Reachable Areas	292
Study on Passenger Travel Characteristics in Rural Township Rail Transit of the Shanghai Metropolitan Area	294
Exploring Pedestrian Comfort and Urban Mobility: A Multi-Modal Assessment of Walking Experiences at Popular Restaurant Destinations in Shanghai	295
Are Space Syntax and SNAMUTS a match made in heaven? How to combine accessibility tools of different scales and scopes to bridge conceptual gaps in planning practice	296
Rail transit integration and land prices: Evidence from inter- and intra-city networks in the Yangtze River Delta, China	297
Adapting the 15-Minute City Model for Suburban Areas: Key Performance Indicators (KPIs) and Multimodal Mobility Strategies	298
Accessibility to urban services by several transport modes using open data to operationalize the 15-min city concept	299
Performance Analysis of 15-Minute City Zones Through Spatial and Machine Learning Techniques	300
The accessibility of social housing units: An analysis of location and policy in Flanders (Belgium)	302
Sustainable Urban Mobility Plans: a catalyst for transformative urban practices?	302
Beyond the Access: Structural Vulnerabilities and Spatial Equity in a Multimodal Public Transport Network	303
Do similar social groups have similar mobility in a city? Social areas and mobility in Shenzhen, China	305
Travel Characteristic of Elderly People in Towns of Shanghai Metropolitan Area: An Urban-Rural Mobility Network Analysis	305
The Suburban Transformation: Rethinking Post-Pandemic Urban Futures	307
Modelling Tailpipe Emissions: Assessing vulnerability of emissions with a planning perspective	308
Navigating Public Perceptions of Urban Mobility Transformations	309
Sustainable mobility and Consolidated City. Urban Regeneration strategies for the Metropolitan City of Rome	310
Planning amidst Planetary Crisis: Rethinking Theory and Practice through Adaptive Transformations in Public Transit	311
Reimagining the Safe System: A Case for Equity in Road Safety	313
Study on Mobility Habit Transformations - Introducing a New Light Rail in the Helsinki Metropolitan Area	314
Can pedestrianization trigger gentrification? Insights from Barcelona's transformations	315
Shaping the Future of Mobility Culture: An Expert-Driven Policy Roadmap	317
Identification of Green Commuting Opportunities in Peri-Urban Town Clusters in Metropolitan Areas of Shanghai	318
Local accessibility and mobility behaviour in large-scale housing estates: comparative results from a multi-country residents'survey	319
Suburbia or Dead End Street? Rethinking Mobility in Central Europe	321
Urban equity and the spatial distribution of speed limits: "Fast"versus "slow"neighbourhoods?	322
Is SUMP a Panacea for Dynamic Cities? Bridging Ambition and Reality: A Case Study of Istanbul	324
Opening closed practices to other ways of seeing: Transport and Urban Planning's imperative for self-reflection and re-invention	325

Prosumers' Adoption Behavior of Shared Parking Services: Implications for Sustainable Urban Planning	326
Perceived Barriers and Enablers to Using Transit: Understanding heterogeneity of perceptions across different groups of the population . . .	327
Operationalising Mobility Justice in Urban Street Transformations: Insights from Five European Cities	328
The Flux of Urban Mobility and Social Discourse on Bus Usage: A Text Mining Approach to Global Public Perceptions of Bus Services in the Digital Age	330
Car dependence dynamics between spatial and individual factors: a quantitative methodology addressing regional challenges in Lombardy (Italy)	331
The role of the car in a post car society	333
Plugging into green mobility: public perceptions and barriers to V2G adoption	334
Do car-restrictive policies shape elections? The electoral impact of implementing low-traffic zones.	335
Why public transport policies work or not? A meta-analysis based on the Behaviour Change Wheel model	336
From a linear infrastructure to a logistic operational landscape: the BreBeMi Motorway in Bergamo plateau	338
"I travel because I want to be well": How daily travel contributes to older adults' quality of life in Canada	340
Can On-Demand Transit Systems provide equitable public mobility services? A comparative study in two continents	341
The elephant in the room or how to live on Planet A in a post-car age . . .	343
Interpretative challenges of car-dependency in peri-urban contexts. An experimental approach and policy implications	344
Queer Mobilities: Experiences of Liveability in Barcelona and Implications for Urban Planning	346
Exploring children's active commuting to school and associated social inequalities	347
Spatial and social justice "on the street" and "beyond the streets": reflections on Barcelona's superblocks	348
The social impacts of urban sustainable mobility policies, case study of the East Bristol Liveable Neighbourhood (EBLN)	348
Measuring inequalities in accessibility: how does destination choice matter?	350
Contextual Behavioural Factors into Active Transport Infrastructure	350
Determinants of individual mobility behaviour: how to influence the modal split of commuting in the Vienna city region	351
Modeling Access Ergonomics to Daily Life Resources using Sustainable Modes within the Eurométropole de Strasbourg	352
Urban mobility lifestyles: exploring definitions, metrics, and emerging research directions	354
Assessing the Integration of Spatial and Strategic Plans in Sustainable Urban Mobility Planning: Insights from SUMP İzmir	355
Planning for Play-Friendly City: Global Narratives and Local Interpretations in the Context of Istanbul	356
Optimisation of non-motorised facilities in urban fringe sheltered housing areas: Transport Accessibility and Equity Enhancement Based on Supply and Demand Analysis	357
The Sustainability of Proximity: A Literature Review of the 15-Minute City .	358
Sustainable Mobility in Coastal Regions: Challenges and Solutions from the MERCIE Project	359

Big Data Analysis of Pedestrian traffic in Boulevards vs. Other City Streets .	360
Proxies for walkable urban design - three case studies in Lodz, Poland . . .	361
Evaluation and Optimization of Public Service Facility Accessibility in Planning Future Community Living Circles: A Case Study of Yangpu District, Shanghai, China	362
Multiple intra- and inter-city rail-based services in India	363
Exploring Functional Configuration in European Station Areas Based on Multi-Scale Accessibility Quantification	364
An Exploration of Route Synergy between Attractions in Xi'an's Main Urban Area Based on the Node-Place Model	365

Track 4 | GOVERNANCE 367

Hydraulic and regional planification in the Tigris and Euphrates basin : a complicated process facing geopolitical constraints	367
Cross-Scale Transactions and Multi-Level Governance on Spatial Gains of Commons: A Comparative Study from Türkiye	367
Transnational Knowledge Flow: Evidence from Chinese Planning Scholars' Involvement in International Conferences	368
Enhancing Resilience in Agrucultural Water Management: A Social Network Analysis Approach to Identify Leverage Points for Climate Adaptation .	369
Industrial Transformation and Upgrading of Small Towns and Regional Collaborative Development: A Case Study of Zhili Town, China	371
Territorial Governance across borders –the Example of the Greater Region	372
A protocol to research climate adaptive governance systems for infrastructure and equity	373
Territorial Transitions and Governance in Alpine Regions: The Case of Valtellina within the EUSALP Framework	375
Reinventing Cities in Madrid: the life and death of a Parisian model of municipal land allocation?	377
Introducing a Method for Measuring the Geographic Boundaries and Advantageous Potential Functions of the Wuhan-Xianning Cross-Border Urban Cooperation Zone —An Investigation of an Emerging Regional Unit in the Adjacent Areas Between Chinese Cities	378
Resources as Mediators: A Case Study of Neighbourhood Conflict in Dingshan, Nanjing	379
An Overview of Urban Policymaking through Institutionalisation for Development of the Cities in Turkey	380
Typologies and Dynamics of Urban Growth Projects in Ethiopia: A Discursive Analysis	382
The cautious revival of national spatial planning: lessons from the Netherlands	382
Ethnographies of Institutional Learning within Social Innovation Encounters: the case of Turin (Italy)	384
Regional planning for no net land take: Designing strategic planning processes in peri-urban Austria	385
Metropolitan Governance for Just Retrofit-Led Regeneration: A Comparative Analysis of London and Barcelona	387
Governing tactical urbanism. Innovation in decision making processes and planning approaches in the case of Genoa, Italy.	388
City-to-City Learning for a Climate-Neutral Future: Insights from the NetZeroCities Twinning Learning Programme	389
Are You a Stakeholder or a Streekholder? Formal and informal planning in the Flemish-Dutch Delta	391

Public-Private Partnerships in Urban Regeneration Projects: the Italian context and the case of “Porta a Mare” in Livorno	392
Impacts of rapid policy changes on sustainable urban development: a dynamic assessment based on China’s Urban Green Action and SDGs . . .	393
What’s the planner’s role in policy making for sustainability? Using Q methodology to explore how public planners perceive their scope of action	394
Similar Networks, Different Discourses: Comparing interpretive frameworks for climate adaptation in Dutch water and road infrastructure planning	395
State-local political interactions in governing complex regions: empirical evidence from cross-jurisdictional metropolitan regions Yangtze River Delta in China and Rhein-Neckar in Germany	397
Navigating Conflicts and Paradoxes. Analyzing the Interaction of Urban Regeneration, Local Governance, and Public Policy in the Tirana Riverside Project	398
Governing climate adaptation: technical and institutional enablers from Bologna’s transformational case	399
Public-Private Joint Ventures in Urban Development: Identifying and Governing Value Tensions	400
Multi-Level Collaborative Governance for Environmental and Climate Adaptation: Insights from EU-funded Projects	402
Collaborative governance through the Mediterranean: Framing a Community of Practice for Wetland Contracts	403
Establishing the foundations for a Transnational Network for Integrated Spatial Planning. Preliminary efforts and insights	404
Enhancing Land-Use Governance in Estonia: The Need for Standardised Terminology and Data Integration	405
The added value of Section 106 Agreements and CIL in England	407
Construction of Regional Multi-dimensional proximity Network from the Perspective of Collaborative Agglomeration	408
Strategic metropolitan governance for resilience in practice: The Barcelona Metropolitan Commitment 2030 and the governance model in the German Metropolitan Region Rhein-Neckar	409
Youth participation in Structural Transition in Lusatia, Germany: Race Up Together or Race to the Bottom Alone?	410
Spatial Planning and Experimental Governance: A Bioeconomy Framework for Sustainable Transformation	411
Civic initiatives, urban regeneration and urban planning participative processes: from collaborative to prefigurative frames.	412
Formal participation in environmental assessments. Examining the case of large-scale linear infrastructure projects.	413
Rethinking Policy Learning in Urban Policy Mobility	414
Ways of learning in urban governance experiments: Insights from the Vienna Climate Team “Wiener Klimateam”	415
Institutional and community learning for transformative urban practices: Experiences from Area Based Initiatives in Trondheim, Norway	416
Transformative planning or a vicious circle - cities running ahead or running alone?	417
Discourses of green transition challenging institutionalised spatialities of planning and governance	418

Coastal Governance in the Adriatic-Ionian Region: A comparative analysis of Spatial Planning Systems and Integrated Coastal Zone Management implementation	419
Patterns of establishing and conducting cross-border cooperation: Insights from Poland's borderlands	420
Cross-Border Data Management: Enhancing Collaboration and Sustainable Development in Border Regions	420
Beyond Formal Structures: The Role of Institutionalised Support Centres in Cross-border Cooperation Governance in Italy	422
Crossing Invisible Lines: Navigating Governance and Cooperation Across Subnational Boundaries	423
Strategic Regional Planning and the Role of Regulatory Instruments: Insights from the Emscher Transformation	424
Mobilising Territorial Actors: a comparison between two development policies	425
Alpine interface territories –a new spatial framework for soft governance?	425
Consultocracy in urban regeneration. The case of Poland	427
Actors in power networks: an institution framework of historic urban district renovation actors in China	427
Distinguishing Change from Transformation in South Africa's Spatial Transformation Journey	428
Spaces of exchange?: Reciprocity and public engagement in a Bristol regeneration context - a framework analysis	429
Stakeholder Dynamics in Government-Led Gentrification: Case Studies from Urban Renewal in Beijing	430
The cultures of temporary urbanism intermediaries in France: exploring the dilemmas of hybrid civic action	431
The Forgotten Refugees: Reframing Urbanization and Governance in Shagarab Camps, Eastern Sudan	432
Innercity redevelopment - processes, instruments and stakeholders in German cities (insights from the research accompanying the federal program)	434
Can super citizens save the city? On the use of civic energies in planning.	435
People's Plans: Partnering with communities to take action and influence planning	436
Redefinition of Urban-Rural Boundaries Under Centralized Governance: Urban Environmental Movements in The Case of a Coastal Town, Ayvalık, Turkey	437
Neo-Exogenous Development: China's Integrated Territorial Development Approach against Rural Marginalization	439
From Intentions to Outcomes: Meaningful Collaboration in Participatory Processes for Sustainable Transitions	440
Involving Youth in Urban Governance: Project on the "Participatory Skills for Sustainable Urban Governance	442
Beyond ordinary boundaries. Dealing with housing rights to address spatial inequalities	443
PARTICIPATION AFTER DISASTER: CENTRAL GOVERNMENT APPROACH TO PARTICIPATION PLANNING	444
Multilevel Governance for Urban Water Resilience, the case of the Water as Leverage (WaL) Programme	445
Towards Integrated Water Governance in Indonesia: Harmonizing Local and Transboundary Solutions	447

Participatory Urban Planning for Sustainable Urban Regeneration: Insights from a Case Study in Korea	448
Towards co-governance? Emergent norms and forms of neighbourhood governance in urban China	449
Community Renewal and Autonomous Governance Dynamics: A 30-Year Analysis of Hangzhou's Practice	450
Building institutional capacity for meaningful citizen engagement –exploring public-private-civic collaborations in Dutch urban development practice	451
The governance of peri-urban areas for inclusive transformations: Challenges of Governance-Cases acting within multi-level conditions (1) . .	452
Place-Based Engagement Strategies with Local Communities for better Climate Resilience Governance in Disaster Situations: Putting Principles into Practice for Local Governments	453
Planning social infrastructure in cities: A historical account from Brussels .	455
Before and after the pandemic period: 'Trade districts' in Lombardy and governance of urban and territorial services	456
Market-Embedded Collaborative Rural Governance: Three Cases of Village Operations in Hangzhou, China	457
Exploring the Spontaneous Utilization of Industrial Land in Development Zones from an Informality Perspective: A Case Study of the Jincheng Development Zone in Shanxi, China	458
Resilient Transformation spaces: Changing tendencies of planning cultures with a focus on governance in transformation spaces	459
Crossing boundaries and enabling the conversion of military land into social housing. The case of Spain	460
Community infrastructure in regional Australia: the impact of community hubs and recreational facilities on social connection, place attachment, and resilience	462
Participatory Design Processes and Actors in Public Space Case of Buyukada Fayton Square	463
Who will plan for "ageing in place"? Governance of affordable housing for a growing senior population in Switzerland	465
Identifying Barriers to Compact Urban Growth in the Irish Housing Sector: Insights from Industry Experts	466
Transit Fragmentation as a Governance Challenge: Comparing Formal & Informal Institutions Facilitating or Hindering Cross-Agency Transit Coordination in the US & Europe.	467
Governance for Bioeconomy Planning across Territorial Boundaries	468
Productive Cities Down Under?: The contested governance of industrial land and the challenge of planning for urban industry in Australia . . .	468
Co-Creating Just Energy Transitions with Vulnerable Communities: Lessons from Local and Regional Energy and Regeneration Policies	469
Understanding governance as a dynamic local response: England's Civil Society Organisations in the changing landscape of urban governance	470
Housing cultural futures: The role of Norwegian 'kulturhus' in local urban development and planning	471
Collaborative Governance of Public Urban Gardening: Theoretical and Methodological Insights from Greater Sydney	472
Shaping Age-Friendly Communities: Towards More Inclusive Participation of Older Adults in Neighbourhood Planning	473
Self-government processes of the urban bioregion: insights from a study on the Metropolitan City of Rome Capital	474

Learning from the social innovation-institution relationship. An ethnographic study in the Veneto Region	475
Exploring the Future of Metropolitan Governance: Metropolitan Management and Regional Development in Decentralized Indonesia	477
Energy Transition and Community Engagement: The case of NSW, Australia	478
Rural Revitalization Beyond Administrative Boundaries: A Case Study of Villages Surrounding Taihu Lake, China	479
Is the polycrisis finally leading to the privatization of risks? Evolving understandings of state responsibilities facing disasters in Italy.	480
Values-driven development? Environmental regulation and planning for development in the UK	481
Participatory Community Planning and Collaborative Governance in the Post-Growth Era: A Case Study of the Nanning Love-U Garden Network in China	482
Zero Net Land Take Policy Mapping: A Multi-Level Analysis in the Context of Italy and Emilia-Romagna	483
The proposed new spatial planning law in Italy: A critical reflection on its structure, content, and objectives in times of crisis	484

Track 5 | ENVIRONMENT AND CLIMATE 487

Geographies of Carbon Trading: Spatial Planning Approaches for Equitable Offset Projects	487
Pursuing climate neutrality through ecosystem services: Evidence from Campania Region, Italy	488
Optimizing Carbon-Neutral Campus Renewal: A Case Study of Xi'an East Station Hub Core Area	489
Between Walls and Water: Stormwater infrastructure, everyday adaptation, and the quest for environmental justice in Mumbai	490
Communities facing floods: risk awareness and climate adaptation strategies in Polish mountains	491
Adapting urban coastlines: strategies and open questions from European regions	492
Through Children's Eyes: Exploring Climate Change and Flood Resilience in Indonesia's Coastal Areas	493
Temporal-Spatial Distribution Characteristics of PM2.5 and Noise in the Under-Viaducts Space	494
An Examination of the Environmental Impacts of Mega Projects on Rural Areas: A Case Study of Two Villages in the South Marmara Region of Turkiye.	495
Linking outdoor particulate pollution to children's negative experiences of their neighborhoods: Findings from an interdisciplinary research project in Ankara	496
Uses and limitations of community participation tools and strategies to create positive energy districts: A literature review	497
Simulsoil: Sustainability-Oriented Soil Planning and Management in Turin's Metropolitan Area	499
Social Movements and Collective Climate Adaptation: The Case of Campo do Bomba, Duque de Caxias-RJ	500
Analyzing heat-related health risks on a local level: Results from a household survey in Dresden and Frankfurt/Main, Germany	501
Addressing Climate Equity Through Community Engagement on Virginia's Eastern Shore	503

Retreat, Cooperate, Overlap. Rethinking spatial strategies for coexistence on the Medi-terranean coast within climate change	504
Feminization of Energy Poverty in China: Contrasting Urban and Rural Experiences	505
Simulating Urban Green Space's Cooling Impact on Adolescents' Sleep Quality Using Diverse Planning Approaches	507
Understanding social acceptance of decarbonisation policies in planning towards positive energy districts	508
Living on the edge: How do perceptions of coastal erosion risk affect residential mobility decisions?	509
Forming to inform: the role of ecosystem services knowledge for climate adaptation planning	511
Evaluating Black Sea Coastal Road and Reclamation Projects in the Context of Sustainable Coastal Planning	512
Exploring coastal boundaries: transformative planning as a tool for territorial resilience	513
Coordinated Development and Coupling Mechanisms of Capital Flows and Carbon Emissions from the Perspective of Environmental Justice	514
Integrating equity in adaptation planning: identifying and prioritizing projects for the biggest impact	515
Optimizing Decision-Making for Climate-Neutral Post-War Buildings: The Architect's Role in Sustainable Transformation	517
Local Level Coastal Adaptation: Evaluating Queensland's QCoast2100 Program	519
Addressing Synergistic Health Risks of Extreme Heat and Air Pollution Under Climate Change: A Citywide Spatial Assessment in Shanghai, China	520
Trade-offs in Urban Planning: Insights from Coordinating Green Space Preservation and Affordable Housing in Vienna	521
The Relationship between Climate Action Plans and Spatial Planning: The Case of Gaziantep City Center	522
Understanding the usability of climate services –An Actor Network Theory perspective	523
Nature's renaissance: rethinking brownfields through ecological regeneration	525
The Thresholds of Urban Parks' Characteristics on Heat Mitigation Effect – Case Study of 120 Parks in Foshan, China	527
Airscapes: Understanding Urban Air Quality Through Data-Driven Mapping	528
Urban Polarization: A Barrier to Carbon Neutrality	529
Providing Strategies for Sustainable Cities by Comparing the Carbon Sink Benefits of Blue and Green Spaces: Evidence Based on Multiple Sources of Data	531
Climate Gentrification in Florida: Perspectives from City Officials, Housing officials and Advocates in Tampa and Miami	532
The Expansion of High-Tech Zone Development and Regional Carbon Emissions: A Synergistic Exploration of Spatial Heterogeneity and Environmental Justice	534
Deep Learning-Based Building Energy Consumption Prediction Model Considering Occupant Density Using Mobile Network Big Data: A Case Study of Seoul	535
Accounting Beyond Boundaries: Exploring consumption-based carbon approaches in Paris and Gothenburg	536
Participatory Methods for Climate-Resilient Urban Development: Case Studies from Finnish Municipalities	538

The Socio-ecological Transformation: A Class Question?	539
Receiving Communities During COVID-19: Lessons for Climate Migration . .	540
Assessing Green Transition Initiatives: A European Comparison Perspec- tive between Paris, Milan, and London	541
Transforming a consolidated City into a resilient City: Lessons from Lis- bon's recent strategies	542
Analysis of the relationship between changes in greenhouse gas impacts due to changes in urban form in sub-regions of Korea	544
Landscape Assessment for Climate Adaptation: A Strategic Approach to the Nature Restoration Law	545
Migrants'housing energy commons in Thessaloniki	546
Overcoming systemic governance barriers for city-civil society collabora- tions in urban green infrastructure: Lessons from 121 German cities .	547
Using Participatory GIS for Sustainable Campus Planning: Insights from GreenHack Hackathon	548
Zero carbon, some nuisance: Exploring the viewpoints of heat pump own- ers and their neighbors in Groningen, Netherlands	549
Spatio-temporal evolution and influencing factors of urban carbon emis- sion efficiency in six major urban agglomerations in China	550
Post carbon cities: Reducing GHG emissions using campuses as a decen- tralizing energy system	551
Bridging policy and practice: a dual approach to spatial planning for cli- mate resilience in the Delta Po Area	552
Assessing the Interplay Between Policies for Climate Change-Induced Dis- aster Risk and Urban Growth in the Case of Istanbul, Turkiye	553
ALLEVIATING NEGATIVE SOCIAL CONSEQUENCES OF SUSTAINABILITY POLI- CIES IN URBAN AREAS	554
Adaptive Governance for Urban Heat Resilience in Xi'an's Vulnerable Com- munities	555
Mapping Norrbotten's green transition: A preliminary study to achieve the sustainable development goals	556
Integrating Heat Resilience into Urban Planning: Lessons from Greater Syd- ney Heat Taskforce Influence on the NSW Planning System	556
Positive Energy Districts (PEDs) as a Climate-Resilient Solution for Social Housing	558
Retracing Critical Energy Fictions with Youth through a Comparative Anal- ysis of Community-Based Interventions	559
Urban Water in Nationally Determined Contributions (NDCs): A Global Analysis	560
Navigating estuaries in a changing climate through collaboration? Insights from a comparative study of the Scheldt and the Elbe	561
From pilot to paradigm: A call for entrepreneurial planning to scale-up the implementation of nature-based solutions	562
Exploring Low-Carbon Urban Development at the Plot Scale: A Study of Carbon Emission Mechanisms and Empirical Exploration of Micro-Renovation for Emission Reduction	563
Green inequalities and Public space deprivation: emerging patterns and new forms of polarization in the case study of Palermo.	565
Urban Form Shapes Bird Community: Insights from the green capital of Europe 2024	566
The Impact of Urban Compactness on the Urban Heat Island Effect - Evi- dence from 119 Cities in China	567

Towards a better integration of urban agriculture into urban planning for healthier cities. Results from a systematic review	568
Waterfront Transformations in Danish Port Cities: Urban Regeneration and Climate Adaptation	569
Exploring Two Interpretative Models of Eco-Cities in The United Arab Emirates: Masdar City and The Sustainable City Dubai	571
Life BEEadapt project: climate risk assessment for pollinators. An ecosystem services and collaborative governance approach	572
Fostering Resilient and Healthy Cities: MAINCODE Urban Climate Shelters as Cooling Demonstration Projects	573
Functional Adaptation Areas: Rethinking functional areas for climate adaptation governance.	575
What if the Butterfly effect was real? Assessing the contribution of greening plans to urban biodiversity in Italy	576
Seeking a possible Positive Energy Districts (PEDs) location choice from a local context, a case study in Tainan City, Taiwan	577
Party politics and local administrative capacity in climate governance: a comparative study of the heat transition in German cities.	579
Framework for prioritising water body restoration: a context of Indian populated cities with climate challenges	580
Investigating the impact of Urban Form Elements on carbon emissions at Different Development Stages: Based on GWR and Random Forest Models	581
Unraveling the mechanisms of extreme heat on urban mobility resilience: a cycling perspective	583
Exploring the Carbon Emission Impact of Community Life Circle Shared Clusters: A Case Study of Nanjing, China	584
DESIGNING [FROM] THE SEA Challenges, methodologies and scenarios for planning with water	585
A Model for Energy Transition Towards the 2050 Climate Neutrality Goal: Positive Energy Districts (PED)	587
Inspiration for Pathways towards Multi-Scale Green Urban Regeneration and Planning Construction under Dual Carbon Goals	588
A Multi-Risk Framework for Assessing Urban Flood and Drought Risk: Lessons from Barcelona	590
Hydraulic Heritage and Community Identity: Examining Socio-Ecological Resilience and Heritage Transformation in Huaibei Area, China	591
Quantifying Wet-Heat Stress in Chinese Cities: A Unified Framework for Urban Heat Island (UHI) and Urban Moisture Island (UMI) Analysis Using Ensemble Learning	592
Leveraging ecosystem services for resilient flood management: a composite index for prioritising actions	593
Holistic Energy Resilience Assessment for Advancing Green and Just Energy Transition (Case Study: Semarang City, Indonesia)	595
Transforming Spaces: Rethinking Urban Parking Lots for a Sustainable Future	596
Sustainability Challenges and Solution Pathways: A Meta-Perspective on Transdisciplinary Urban Research in SEA and China	597
Integrating Climate Risk and Vulnerability Assessments into Sustainable Real Estate Development: Insights from the city of Venice & Milan	598
Exploring the link between biodiversity, health, and climate action through the URBioPark project	600

Energy saving and transition in Europe: what's the mood? A comparison of governance models	602
The Legacy of Experience: Reflections on Climate Transition Strategies in Medium-Sized Italian Cities	603
Trade-offs in Rural Italy: Analyzing the Unbalanced Integration Between Agriculture, Biodiversity, and Solar Energy	604
Carbon Neutrality and Spatial Equity in Urban Planning: Assessing Plan Quality in South Korea	605
Reintroduction of health impact assessment in Bulgarian city planning – why and how?	607
Identification of hotspots in a regional green infrastructure: A comparative analysis of the regional contexts of Campania and Sardinia, Italy	609
Blending Nature with Technology: Integrating RES with NBS or carbon neutral cities	610
Urban heat islands assessment for building city resilience: a novel approach	611
Energy Hubs Under Transformation and the Implications for Spatial Planning: The Case of Ravenna, Italy	612
Towards Transformative Planning Frameworks and Urban visions for Climate Resilience: A comparative study on convergencies and conflicts at redevelopment sites in Valencia, Milano and Berlin	614
Preserving the past or protecting the future? Harmonizing Cultural Heritage and Climate Adaptation in Siena	615
Research on Cross-domain Eco-Spatial Synergistic Governance based on the Systems Ecology Paradigm	616
Depoliticizing Urban Water Management: Governance, Justice, and the Sponge City Initiative in China	617
Urbanization, Biodiversity, and Ecosystem Services in Norway: Challenges and Strategies for Sustainable Land Use.	617
The Art of Coping with Disasters: Understanding The Transition Towards a Resilient City-Based Approach in Sustainable Planning	618
Climate-related knowledge in urban masterplans	619
Action-Oriented, Transdisciplinary Co-Production and Urban Just Transitions: Bridging Theory, Practice, and Equity.	620
Managing the energy transition: balancing the conflicts between landscape safeguard and the development of renewable sources	622
RETHINKING THE URBAN THROUGH CRACKS: RE-REPRESENTATION OF ARCHITECTURAL MEDIA IN RELATION TO CLIMATE BREAKDOWN	623
A quantitative analysis of Neighbourhood Sustainability Assessment indicators from 13 countries across 3 global regions	624
Urban Just Transitions in Action: Challenges and Potential of a Community-engaged Research in Toronto Suburbs.	625
From Vulnerability to Resilience: Coastal Heritage as Environmental Infrastructure	626
Land suitability modelling for Integrated Mangrove Aquaculture to adapt to salinity intrusion in southwestern Bangladesh based on an integrated GIS-MCE-AHP approach	627
What does the neighborhood mean for the Dutch heat transition? A discourse analysis	628
Node and Path: Seasonal Impacts of Environmental Parameters in Community Green Spaces on the Thermal Comfort of the Elderly	630
Urban Wilderness Protection and Creation in China	630
Urban Adaptation Policy and Social Justice: A New Framework for Understanding the Social Role of Adaptation Measures	631

Intra-urban CO ₂ Spatiotemporal Distribution and Driving Urban Factors Using Multi-source Data: A Case Study of Shanghai	632

Track 6 | URBAN CULTURES AND LIVED HERITAGE 634

Ghost plots –memory of empty urban spaces	634
Measuring Cultural Participation: A Comprehensive Study in Kayseri	635
Public Emotions and Visual Perception of Historic Districts: An AI Approach Using Social Media Data	636
Research on the Revitalization Models, Mechanisms and Influencing Factors of Historical Buildings in High - density Cities: A Case Study of Hong Kong	637
Exploring Technology Use of Households in the Istanbul Historic Peninsula: Towards an Information Society	639
Locating transnational projects and UNESCO World Heritage: Diffusion, features, and types of projects located within sites, buffer zones, and nearby	640
Exploring Synergies between Built Heritage and Climate Discourses in Urban Transformation: A Scoping Review	641
A Critical Ethnographic of 'Ziddi' Feminist Socio-Spatial Practices in a Modern-Mohalla of Islamabad	642
Urban Heritage and transnational networks in the case of Municipio Station in Naples, Italy	642
Framing the Narrative of Chinese Post-Colonial Heritage: Storylines and Mechanisms of Shanghai Concession Heritage Management	644
Spatial Identity and Urban Form: Nation-wide Research for Slovenia	646
Heritage privatization in Venice: public-private interests in the conversion of the Fondaco dei Tedeschi into a luxury store	647
Exploring the Emotional Dynamics of Beyoğlu's Transformative Urban Atmosphere through Music Ecosystems	648
Cinematic Cityscapes: A Filmic Exploration of Urban Cultures in the Contemporary Fiction Films of Directing Duo Adil El Arbi and Bilall Fallah	650
The inheritance mechanism of rural living heritage in China based on the model of "rural governance - policy supply - protection and activation"	650
Canal Imperial de Aragón, the functionality of a water infrastructure and the inheritance of a traditional agriculture landscape in Spain	651
Reviving Living Heritage in Antakya: Pathways Towards Community-Led Planning	653
The Intersection of National Image, Urban Development, and Civic Life: A Study on the 70-Year Evolution of Large-Scale Sports Architecture Heritage in Beijing	654
Manufacturing Heritage for Piazza Garibaldi in Naples (Italy)	655
The Spatial Dynamics of Cafés as Everyday Urban Spaces: Exploring Socialscapes through Streetscapes	656
From Rise to Decline and Back Again? Delving into the Potential of Revitalising the Historic Neighbourhoods of Eleftheroupoli, Greece	657
Emerging archaeology and cultural landscapes in the Campi Flegrei: a knowledge-building laboratory for territorial regeneration	658
Exploring Policy Frameworks for Cultural Heritage in Climate Adaptation and Disaster Risk Management: A Cross-Case Comparison	660
(Re)Production of Urban Space through Cultural Events: Legacy of the Bergama Festival	661
A Retrospective of the Destruction of Ankara İller Bank in Ulus as a Paradigm Shift in Turkish Urban Renewal Politics	662

Defining typologies in the Bosphorus: Alternative Approaches for Future Proof Urban Coasts	663
ECONOMY OF CULTURE: RE-CONSIDER URBAN CULTURE OF DIYARBAKIR	664
Reviving Cultural Heritage Under Pressure: Geopolitical Constraints and Rapid Urbanization in Ramallah's Historic Center.	665
Heritage Perception and Identity Construction Among Residents in Industrial Community Transformation: A Case Study of National Creative Park, Nanjing, China	667
Mapping Changes in Public Perceptions of Chinese Historic Districts: An Integrated LDA-LLM Analysis of Social Media Commentary (2009-2023)	668
Integrating Historic Urban Landscapes into Urban Regulations: Evaluating the contribution of Switzerland's Federal Inventory of Heritage Sites (ISOS)	669
Silent evidence. On nuclear mounds, craters and caves	671
The heritage-climate change nexus: towards a values-based adaptive planning response	672
Evaluation of the Contemporary Cultural Landscapes in Grand Canal (Hangzhou Section) based on Multi-Dimensional Value Coupling	673
Exploring the heritage - transnational nexus: Disassembling the Ara Pacis Museum in Rome	674
From Market to Mall: The Evolution of Modiano Food Arcade in Thessaloniki	675
Balancing Tourism-Driven Dynamics and Everyday Life in Heritage Space. The case of Tallinn Old Town	676
Digital platforms, regulatory planning and heritisation: Airbnb and new practices of heritage in the medina of Tunis (2011 to 2024)	677
Co-designing Net Zero Strategy in historic settings: Bristol's case study	678
Rethinking Creative Cities: Towards Inclusive and Equitable Urban Transformations in India	679
everyday heritage: an approach for value-driven transformation	680
Participatory heritage planning in practice: Lessons from Balıkçıköy, Istanbul	681
Possible Uses of Urban Heritage for Social Cohesion	682
Integrating Heritage Planning into Urban Policy Frameworks: The Case of Istanbul Vision 2050	683
Environmental imaginaries of resistance: the case of the waterfront of Thessaloniki	684
The Dilemma of Authenticity: The Conservation and Reconstruction of Traditional Residences in China —Taking Pingyao, Suzhou and Shanghai as Examples	686
Social Entrepreneurs as Innovators in Sustainable Heritage-Led Urban Regeneration	686
Affective Discourses Against Heritage	688
Digital Platform for Inner Areas	689
Fixing Collective Memory: embracing Designer-Led Regeneration practice of Historic Community	690
Lived Heritage through the Changing Gaze: A Views and Vistas Analysis for Valletta	692
Reimagining Postgrowth Urbanism: Adaptive Reuse of Industrial Heritage for Sustainable Futures	693
The Sacred Mountain of Gargano: Urban Culture and Sacred Landscapes	694
From Large-scale Modernist Planning to Small-scale Urban Blocks: Spatial Transformation Experiments in China's Large Gated Communities	695

The Manifestation of Patterns and the Reconstruction of Meaning: The Reproduction of Spatial Patterns and Role Interpretation Along Xi'an's Historical Urban Axis	697
Research on Cultural Adaptation Mechanisms of the Duku Heritage Corridor Based on Heritage Ecosystems	698
Antifragile Monuments: The Metropolitan Dimension of Living Culture and Sustainable Heritage	699
Characteristics and Mechanisms of the Spatial and Temporal Distribution of Cultural Heritage in the Section of the Yellow River Basin in Qinghai Province	700
Exploring Spatial Evolution of Traditional Settlement Landscapes in the Southern Taihang Region of China: A Study on Cultural Ecosystem Dynamics and Reconstructive Strategies	701
Cultural heritage as an urban welfare infrastructure for sustainable, safe and inclusive territorial development	702
Understanding the cultural potential of rural history: A conceptual framework of cultural capital development	703
Immanent Vulnerabilities of Coastal Urban Heritage to Climate Change	704
Study on evaluation of liveliness level and promotion strategy for intangible cultural heritage in Qinghai Province	706
An Integrated Visual Framework: Using SVIs to Inform Detailed Street Renewal in Historic Urban Spaces	707
Drawn City: the effects of women's graffiti in public spaces of Rio and Barcelona through cartography	708
Reversing cultural marginality in inner peripheries: the key role of heritage communities	709
Research on the Conservation and Development of Residential Historic Districts Based on the Transformation of Human-Land Relationship: A Case Study of Hehuatang Area in Nanjing	711
Complex System Conservation Technology for Spatial Cultural Heritage Networks: A Case Study of Qinghai Province, China	711
Track 7 INCLUSION	713
The Economic Benefits of Gender Equality: A Case Study from Europe	713
The Role of Spatial Alienation in the Journey of Existence as an Actor in Contested Urban Areas: The Case of Kasımpaşa, Istanbul.	713
Urban Environmentalism and the Political Ecologies of Waste in India: Narratives of Inclusion of Informal Waste Workers in the Formalised Waste Infrastructures from Patna	714
Governance, Participation, and Trust: Insights from the Lower Ouseburn Valley	716
Community-Driven Approaches to Climate Equity and Adaptation	716
Counteracting digital divides through a place-based inclusion process. Insights from an ongoing research project.	717
Shaping urban and rural contexts for healthier lives: environment as a key driver for promoting health –SURVIVE	718
Gender Inclusive Approach in Local Adaptation Policies in Climate Disaster-affected Coastal Settlements	719
Evaluating the quality of children's Active School Travel Spaces through multi-source big data: An approach for informing better child-friendly urban design	720
Neighborhood Contexts and Their Role in Intergenerational Economic Mobility in South Korea	721

A Capital-Based Assessment of the Livelihood Vulnerability of Syrian Refugees	722
Exploring Environmental Perception, Cognition, and NIMBY Sentiments Toward Psychiatric Hospitals: A Spatial Planning Perspective	723
Searching for Possibilities of an Age-Friendly Planning in a Small-Sized City: Saray, Tekirdağ - Turkey	724
Gender-Responsive Approaches in Post-Disaster Temporary Settlement Planning: Insights from Malatya and Adiyaman	725
Neighborhood walkability for older adults and their travel —Shanghai Anshan area case study	726
What do we mean when we talk about feminist urban planning?	727
Desiring a Gadjó City: Political Economy in Post-fascist and Postcolonial Rome	728
Exploring a framework for children's participation in mobility issues and urban planning	729
How Spatial Factors Affect Respiratory Health in Coal Resource-based Cities: a Case-control Study in Eastern Yunnan Province, China	731
Access to Sanitation in Informal Settlements of Jakarta	732
School and Residential Segregation in Ankara: The re-production of urban divisions	733
Justice on the move: Behavioral interventions for inclusive and active mobility	734
Transformation of Everyday Life Practices of Urban Migrants in Rural Galipoli Peninsula	735
Multiculturality in Lisbon: Migration, Integration Policies, and Urban Space	737
Class polarization and housing accessibility for migrants in the Zurich urban area	738
Aging in (urban) Place: The psychological contribution to multidisciplinary research on urban vulnerability	739
Rethinking Social Inclusivity. The Case of Urban Villages in Delhi	741
Navigating Host Cities as Muslim Women Refugees; the role and potential of socio- spatial Integration	742
Urban Form and Social Exclusion: A Spatial Perspective on Residential Segregation in Czech Cities	744
Measurement of In-Situ Urbanization Level and Analysis of Influencing Factors in the Suzhou - Wuxi - Changzhou Metropolitan Area in China	746
The Urban Factor in Creatives' Migration Motivation: The case of High-Skilled Turkish Migrants to the Netherlands	747
A Bibliometric Analysis on the Relationship between Migration and Urban Design	748
Designing Resilient Campuses as Urban Microcosms: Strategies and Interventions for Addressing Vulnerable Users' Needs Amid Climate Change Risks	749
Educational Poverty and Experiential Education to Empower Youth in the Community Planning Process	750
Understanding the socio-spatial transformation through the lens of diversity: Istanbul Kurtuluş	751
Success in inclusion? How do policymakers in Antwerp, Rotterdam, and Gothenburg evaluate inclusive city policies?	753
Judicialization of Urban Planning and its Outcomes for Urban Planning and Democracy: A Critical Analysis of the Turkish Context	754
Where She Thrives: Spatial Resources for Female-Led Venture Growth	755

Coexistence of Inclusion and Prejudice: The Formation of Social Capital and Integration of North Korean Defectors in South Korea	756
A Study on the Optimization of Public Service Facilities in the '15-Minute Community Life Circle' Based on Equity: A Case Study of Wujiaochang District, Shanghai	757
Spatial Development Strategies and Policy Recommendations for Social Development in Shenzhen	758
Reversing the gaze on comparative research in urban sustainability transformations: a decolonial perspective	759
A MODEL FOR MEASURING AND ASSESSING SOCIAL SUSTAINABILITY: ANKARA DIKMEN VALLEY CASE STUDY	760
Just smart? A Preliminary Study on the correlation of Smart City Infrastructure and Gentrification	760
Transformative Planning for Sustainable Futures: Bridging Global Goals and Local Actions through Adaptive Frameworks	761
Investigating Mobility-Impaired Older Adults' Travel Behavior: Evidence from Shanghai	762
Rightwing Politics Among the Global Leftovers: a comparison from Turkey and Colombia	763
Embodying Justice in the Built Environment: Transatlantic Reflections on Carbon Neutrality, Circularity, and Justice	764
Inequalities in Public Cultural Facility Distribution: A Comparative Analysis Across Demographic Groups in Wenzhou, China	765
Trading in the Shadows: Women Traders in the Second-Hand Goods Market Area, Küçükpazar	766
Which development role for civic organisations? Insights from Sicily, Southern Italy	767
SOCIAL MOBILIZATION AND ITS CAPACITY TO TRANSFORM HOUSING POLICIES: THE SPANISH CASE SINCE 2009.	769
The Cultural Capacity of Cities: Baghdad and Nation-Building	769
Mapping inequalities within Southern European cities: cognitive tools and policy perspectives	770
Navigating Urban Borderlands: A Brussels Case Study	771
Inclusive cities through the experience of vulnerability	772
Immigrant Housing and Cultural Practices as a Change Factor in Current Density and Price Distribution of New York	772
Research on the Needs of the Elderly in Urban Renewal of Old Communities: A Case Study of Nanjing	773
The Demand-Supply Measurement of Youth Development-Oriented Cities Based on the Characteristics of Generation Z: A Case Study of Shanghai, Nanjing, and Hangzhou	774
Grassroots Organizations and Informal Sector: A Study of the Hawker Sangram Committee in Kolkata, India.	775
Equity-Oriented Optimization of Public Space Supply-Demand in Aging Communities: A Behavioral Perspective on Elderly Residents	777
Study on the Construction and Inheritance of Rural Models in Shaanxi North from the Perspective of Human-Land Emotional Bonds	778
Peripheralization as process: shrinkage of small towns in metropolitan area——Case study of Shanghai	779
Track 8 EDUCATION AND SKILLS	781
What kind of planning are we preparing students for...and are we succeeding?	781

Supporting transdisciplinary learning using Challenge-Based Learning in planning education	781
Horizontality in practice: an illusion or a horizon for international cooperation workshops?	782
Industry-Academia Partnerships in Cross-Border Innovation: A Case Study of Future Workforce Initiatives	783
Research-Driven Pedagogy: Advancing Transformative Skills in Spatial Justice and Urban Sustainability through Educational Innovation. Insights from the REPLACE Project	784
Reimagining Education through SystemsThinking, Community-Centered Design and Engaged Pedagogy	785
“Worlding” as a Pedagogical Approach in Basic Design Studio	786
Exploring AI and VR in Challenge-Based Learning: A Responsible Futuring Approach for Inclusive Co-Design	788
Agents of Change: Redefining Urban Design Education Through Action and Agency - How studio-based learning, student agency, and taking an active stance equips future planners to address real-world challenges	789
Epistemological Uncertainties in Planning Education: The Transformative Role of Studio Pedagogy	790
Urban planning: how to introduce the discipline?	791
Pedagogy for the future: Equipping students for complex and climate-relevant practice	792
Bridging Theory and Practice: Peer Learning as a Pedagogical Approach to Teaching Planning Theory	793
A Map of Planning - How spatial planning is taught and researched around the world	794
Strengthening Interdisciplinary Cooperation in Planning Education	796
Reimagining urban futures through speculative fiction: nurturing hope and resilience in planning education	797
AI + Geospatial Models for Engagement and Performance Measures in the Pedagogy of Sustainable Planning Studio.	798
The Role of Scenario-Based Design in Spatial Design Processes	799
Knowledge and Skills for ‘Making Transformation’ –Innovative Approaches to Educating and Training Change Agents in Spatial Planning at Higher Education Institutions	800
Educating urban planners in the era of the Anthropocene requires transformative pedagogies: Learner-Centred Pedagogy (LCP) applied in a theoretical Urbanism module in a Greek university	801
Advancing Transdisciplinary Planning Education for Future Cities: European University Alliance PIONEER	803
Post-Pandemic Higher Education: Spatial Transformations, Digital Shifts, and Sustainable Futures	804
Planning education between hybridization and transdisciplinarity: towards a ‘specialized generalist’	805
Project Management in Urban Development. Case Studies from the DREAMER and PM4U Projects	807
Transforming City Regions through problem-solving, collaboration, and conceptual thinking	808
Sismopoli, playing cities in risk	809
Track 9 URBAN FUTURES	811
The fictional municipality of “Zwirgberg” as a model for spatial planning in rural Rhineland-Palatinate	811

Research on the Potential for Future Development of Labin and Raša in Istria	812
Map the Future, Shape the Narrative: Re-thinking the Role of Participatory Mapping in Exploratory Scenario Planning	813
Urban Security: How Urban Design Influences the Emotional Experience . .	815
Looking for justice in a temporary urban greening experiment	816
Encountering the Inevitable: Territorial Narratives as a form of resistance to Urban Mega Projects	817
Urban Future Imaginaries: how is nature framed in planning policies across urban areas in Europe, Latin America and North America? . . .	818
Sustainable Urbanism in the Gulf: A Critical Examination of the Minute City Model	820
Integrated futures work in spatial planning	821
Towards transformative actions through perceptions research: Q-methodology as a tool for identifying ideological dimensions of planning problems	823
Back to the Future. How to Co-produce with Imaginaries?	824
Hybrid lifestyles of young generations. Challenges in ways of living and working towards the urban green care in Oslo and Lisbon	825
Breaking Old Patterns: The Transformative Role of Innovation in Shaping Regional Trajectories in CEE	826
Reimagining the future of peri-urban spaces: planning narratives for the sustainability of these areas. The case study of “Stena tou Nestou” in Xanthi, Greece	828
Unveiling Hidden Potential. A New Typological Approach for the Underground Landscape.	829
Circular narratives and transformative planning: rethinking wastelands . .	830
SUBURBANIZATION IN TURKEY: TOWARDS ANTIFRAGILE PLANNING	832
“Possibility Design”: accepting indeterminacy, irreversibility and complexity in urban policy-making	833
Other Smartness: Experimental Praxis of Smart Cities in India	834
Regional characteristics driving the re-integration of urban-industrial spaces	835
Evolutionary Urbanism: changing mindsets and innovative narratives for future cities	836
Thinking back from the tipping point: Institutional temporalities for climate action	837
Unfolding social-ecological systems futures at local scale through dynamic adaptive policy pathways scenario making; a case from Milan, Italy . .	838
Building Scenarios for Future Communities: Empirical Insights from China .	839
Aspiration and reality: Experiences and reflexions on the initiation, emergence and implementation of urban (and regional) futures	840
The power of facilitating through design. Reflections on designerly approaches at the nexus of research, practice and policymaking.	840
How imaginative design and experiential scenario’s informed Dutch strategic planning: the crucial case of Netherlands Now as Design (1987) . .	841
The future of resharing practices in Norwegian neighborhoods: Perspectives from residents and stakeholders	842
Community Perspectives on Co-Planning Practices in Disaster Risk Reduction: Lessons Learned from Istanbul in the Tomorrow’s Cities Project .	843
Adaptive Riverside Urbanity: Rethinking Urban Design Principles under Climate Uncertainty	844
Reflective Practice as a Catalyst for Transformative Urban Research	845
Non-Statutory Participatory Planning as a Framework for Empowering Public Engagement: A Case Study of Fingal, Ireland	846

Metropolitan narratives and planning transformation: The cases of Greater Paris and Casablanca	848
NEAR AND DISTANT FUTURES: PATH DEPENDENCY VS DISRUPTION IN SPATIAL IMAGINARIES OF THE FUTURE OF ANCIENT CITIES	850
Imagining a city of proximity for fostering transformative capacity towards connected communities	851
From Masdar City, Abu Dhabi to Florya, Istanbul: What Can We Learn from Smart Cities?	852
Sensemaking in Urban Experimentation: The Case of Barcelona Superblocks	853
Local Appropriation Model for Circular Maker Spaces (CMS) in Istanbul . . .	854
The end of infrastructure-led planning?: the (re)turn to strategic spatial coordination in Victorian planning policy	855
Navigating circularity in urban planning: experimental narratives and practices in Brussels	856
Re-thinking the spatial design of future industrial zones: The case of OSTİM, Ankara	857
Innovating planning narratives of the periphery for a more inclusive urban future: The prison of Florence (Italy) as a teaser of transition through transformative actions	858
Foresight as an instrument for Regional Development. The case of Thessaly (Greece)	859
Next Generation EU. The Case of Rome Two strategic actions within a list of projects	860
Towards a Smart Circular Urban Future? Analysis of Water Management Visions in Amsterdam and Busan	861
The Evolution of Dominant Stories in Rural Spatial Planning: A Memetic Perspective	862
Integrative accessibility planning under uncertainty: A learning framework based on a systematic literature review	863
Spatial - Temporal Evolution and Planning Strategies of Population and Construction Land in China's Shrinking County - level Cities	865

Track 10 | THEORIES

867

Investigating communicative planning in the fine grain: Integrating discourse and practice theories for the analysis of participatory justice	867
Understanding Uncertainty in Planning	868
Dare to speak up when something is wrong: Scope of action, roles and feelings in the reflective narratives of Norwegian planning practitioners	869
Making Plans in a World of Uncertainty and Crisis	870
Revisiting Pragmatism: how to make planning theory more relevant to professional practice	871
Attitudes, Actions and Artifacts: Re-Conceptualizing Spatial Planning as Cultural Practice	872
Acceleration or participation: Return to rational planning?	874
Integrated urban planning: solving conflicts between densification and climate adaptation	875
Is there no placemaking, only placemaking practices?	876
Linear Research: Shifting Vantage Points in Urban Theory through a Planetary Transect	877
We Want to Regenerate This Neighbourhood! A Theoretical Framework to Navigate the Spatial Dimension of Property and Its Impact	877
Urban perforation along railway lines: A form of shrinking cities and a proposal for sustainable urban restructuring	878

The Role and Value of Theory in Urban Design: Can They Truly Shape the City?	880
Rethinking Promethean planning: An epistemological enquiry of technoscientific-centrism in planning theories	881
A transformation of planning? Grasping planning-cultural change through socio-material practices	883
What planning needs from theorizing on place in times of global challenges	884
The Insufficient Role of Urban Form and Its Uses in Baseline Assessments of Urban Plans in France	886
Pathways to Urban Resilience: Tactical Urbanism vs. Transdisciplinary Approaches	887
Potentials and limitations of urban digital twins. On the nature of cities	889
«Communities of disagreement» in planning	889
The Radical Means-Ends Model in Planning by Prefigurative Mobilizations	891
The Retheorization of Collaborative Planning Using Hong Kong's Urban Renewal: Mean-End Presupposition, Rationality, and Procedure-Substantive Dichotomy	892
Planning Theory through the lens of its own publication corpus	893
Temporality and strategic spatial planning –Towards an analysis of the Em-scher restoration process beyond path dependence	894
The new urban product in the multiplicity of transnational urbanism; Frag-ile planning approaches under sustainable narratives	895
Urban Science and Emerging Planning Science in the Context of Complexity Thinking	897
Decoding the Neo-liberal Innovation Districts 22@Barcelona: a Territorial Laboratory Where Vulnerability and Possibility Coexist In the Long Term	898
Seeing the small things: politics, aesthetics and everyday urban prefiguration	899
Habermasian lifeworld re-considered: A conceptual tool to move beyond the dividing discourses	900
• Bridging Spatial Energy Planning and Social Sciences Energy Research: Towards an interdisciplinary approach to planning energy transitions	901
Planning and democracy 'otherwise': Learning from Southern onto-epistemologies	903
Green transitions and collaborative landscape strategy making –insights from Denmark	904
The Intersection of Human Settlement Theory and Field Theory: Constructing New Theories of Rural Human Settlements and Pathways for Rural Revitalization Practice	905
If Arendt were a planning theorist: “wandering” thoughts about a hermeneutic phenomenological planning approach	906
Progressive Urbanism	907
Localization and Application of Scene Theory in the Context of Historical Town Preservation in China: A Case Study of Shannxi Mizhi Ancient Town	908
Tensions and ethical considerations in planning practice at the local level: the case of tall buildings in Greek cities	909
Postmodernist Criticisms and Human-Centered Urban Planning	910
Different rental housing policies models and the ongoing difficulty of over-coming the housing crisis	911
Socio-spatial transformations of social housing: A Case Study of the Lisbon Metropolitan Area	913

Towards Drone-Based 3D City Information Modeling for Urban Analysis and Planning	915
Smart City Imaginaries: A Theoretical Framework for Socio-Technical-Spatial Analysis	916
Information science, digital modelling and the legacy of the engineering mindset in planning thought	917
Integrating Mixed Reality and Large Vision Models to Measure Multi-Dimensional Urban Green Perception	918
“Love the Specific Scene of Life”: A Visual Analysis of User-Generated Narratives on Walkable City Spaces	920
Supporting collaborative scenario-building in land use and transport planning: An evaluation of the SIM4PLAN tool.	921
Urban Digital Twins for Cities in Transition: A Literature Review on Current Applications and Future Perspectives	922
A Data-Driven Framework for Enhancing First-and-Last-Mile Connectivity in Bicycle-Metro Integration Systems: Based on Dockless Shared Bicycle Data in Shanghai, China	924
Harnessing Smart Technologies in Real Estate: A New Paradigm for Spatial Planning and Urban Development	925
Using Social Media Big Data and ChatGPT for Identifying Counter-Urbanisation Hot Spots in China	926
“UBT SMART City” Model as a Testbed for Emerging Digital Technologies and Transformative Urban Planning	926
Towards a Domain specific LLM for Sustainable Urban Development: Extracting Research trends and topics from Text Data	928
Testing Virtual Reality to communicate long-term scenarios in participatory planning processes	929
A Digitalised Tourism Sector: Impact on Occupations and Geographies	930
Geodesign as a Framework for the Green Transition of University Campuses: Case Studies from University College Dublin and Aarhus University	932
3D Simulations of Urban Planning Regulations: Assessing Regulatory Impacts on Densification and Urban Expansion	933
A Preliminary Research on Innovative Communication Mediums of Design in Participatory Planning and Community Design	934
AI-Empowered Research on Healthy Streets: An Iterative Path of Streetscape Perception, Evaluation, and Optimization	935
Mobility Digital Twin for Public Transportation Planning: Addressing the Challenges of Depopulation and Aging	937
Emerging Tools for Urban Climate Governance: Decoding Public Participation in Serious Games	938
Using artificial intelligence to analyse the role of multi-level strategic spatial planning in the development of operational landscapes	939
Reframing Urban Narratives: AI, Digital Innovation, and the Role of Intelligent Adaptation in Just and Equitable Planning	940
PC-GAN: A Hybrid Pix2pix-CycleGAN Framework for Low-Carbon Urban Morphology Optimization	941
Unraveling the Complexity of Urban Functional Organization Based on Explainable GeoAI	943
Geodesign for climate neutrality: contributing to Regional Climate Adaptation Strategies in Italy.	944
Digitalization, Culture, and Urban Space Interaction: A Design Fiction Approach	946

Unraveling the relationship between the digital platforms and gentrification: Evidence from Nanjing, China	946
The digital transformation of planning: how data and algorithms are changing spatial planning practice	947
Effective Monitoring and Evaluation for Digital Twins	949
Advanced Quantification of Urban Complexity and Adaptive Capacity: Sub-Fractal Analysis and Spatial Statistics in İzmir	950
A multiscale spatial approach to Climate Planning	951
Intelligent Urban Design: Self-organized Block Form Generation Using Reinforcement Learning—An Empirical Study from Nanjing, China	952
AI-Driven Multimodal Data Fusion for Automated Ontology Construction: Methods and Smart Manufacturing Case Study	953
Geographically weighted machine learning for modeling spatial heterogeneity in off-campus student housing rents	954
Identification of potential regeneration areas in urban residential districts using multi-source big data and GeoAI	955
Towards Ethical Implementation of Urban Digital Twins: Addressing Key Challenges and Recommending Best Practices	956
Motivational Affordances of Gamified Participatory Experiences	957
Intersection of Digital and Physical: Phygital Urban Public Spaces	958
Visual perception and preference analysis of riverfront mountain landscapes in mountainous cities: A study based on user-generated image data	959
Unpacking the Black Box: How does the WeChat application reshape digitally enhanced collaborations between planning practitioners in China?	960
Monitoring the Impact of Urban Regeneration on Green Infrastructure: Istanbul Case	962
Teaching planning cultures? Planning games for intercultural learning across borders	963
The Impact of Environmental Design Elements on Corporate Site Selection for Information Industry Companies in the Metaverse	964
Augmented Reality for Community-based Collaborative Urban Design: A Case Study of RWTH Aachen University Campus Transformation	965
A Novel Large Language Model Approach for Streetscape Perceptual Analysis in Shanghai	967
Spatiotemporal perception of disasters based on social media data in the context of climate change: A case study of Shanghai	967
Agent-Based Decision Support Platform for University Campus Dining Space Management: A Case Study from Tongji University, Shanghai, China	969
Speaking as a river - Introducing multispecies role-playing games for urban sustainability planning	970
Gamifying Participatory Design: A Digital Platform for Urban Renewal in Gangxia Urban Village, Shenzhen	971
The Study on the Measurement and Enhancement Strategies of Urban Street Space Quality Based on Street View Images: A Case Study of Streets in the Central Urban Area of Xi'an	972
The Role of Urban Diversity in Shaping Spatiotemporal Vitality: Evidence from Shanghai	973
Track 12 DISASTER-RESILIENT PLANNING	975
Evaluating Urban Resilience Capacity for Transformative Spatial Planning	975

Planning for managed retreat : challenges and innovations to address long-term uncertainty in France and New Zealand	976
Industry 5.0 as a Tool For Strengthening Urban Resilience Against Crises . .	978
What Are the Obstacles in the Recovery Process Considering the Role of Actors? The Case of the Kahramanmaraş Earthquake in Turkey	979
Flood Risk Perception Under the Levee Effect: Adaptive Management Strategies for heterogeneous individuals	980
Rebuilding Resilient Cities and Communities in Southeastern Türkiye: Relation Between Urban Planning and Data Governance	981
Resilience in Public Utilities: Management Strategies to Mitigate the Impact of External Shocks	983
Heavy rainfall, critical consequences? - Risk analysis of the impact of flood related street blockades on emergency medical services coverage in Münster, Germany	984
Floods and Livelihoods: A Multi-dimensional Comparative Study of Territorial Space Planning Policies for Flood Detention Areas in China	985
Decentralisation as an Agent of Resilience? Evidence from Wartime Decision-Making and Planning in Ukraine	986
Sprawl on Flood Risk : Focusing on Land Use Planning and Fragmentation Index in Coastal City	987
When Buses Become Beacons: Rethinking Buses as Adaptive Responders in Crisis—A Chinese Perspective	989
Agent-Based Modeling Applied to the Analysis of Landslide Risk Dynamics: A Virtual Laboratory to Explore the Underlying Mechanisms of Risk . .	990
INVESTIGATION OF EARTHQUAKE DAMAGE IN TERMS OF DIFFERENT LAND COVERS: 2023 KAHRAMANMARAŞ EARTHQUAKES	992
Adaptive planning paradigms for resilient flood management: insights from Oslo and Copenhagen	993
Balancing development and safety: spatial conflicts in Polish mountain region prone to flooding	994
Gaps and opportunities for integrating planning and disaster management in Australia	995
Post-Disaster Population Mobility: Considerations for the February 2023 Earthquakes in Türkiye	996
Social Vulnerability Mapping	997
Reevaluating Urban Resilience: Challenges and Opportunities in Villeneuve-Saint-Georges' ZAC Centre-Ville and Renaturation Projects .	998
Why should we bother about risk reduction at the urban scale? The Early Recovery System (ERS) framework to assess the impact of seismic prevention instruments on post-quake urban functionality	998
Resilient Land Use Strategies in Urban Waterfront Development towards Flood Risk: A Case Study of Chongqing, China	1000
Exploring the Feasibility of Sponge City Solutions for Flood Resilience in Gangnam, Seoul	1000
How the coastal cities are transforming? The disaster as catalysts of change	1002
Assessment of community resilience to disaster at the local level in Korea .	1003
Disaster Risk Reduction and Spatial Planning in Albania, practice vs theory? how to bridge the gap!	1003
Relationship between Urbanization Policies and Seismic Vulnerability in Small-Scale Cities: 2023 Earthquakes in Turkey and the Case of İslahiye	1004
Dynamic Human-Centered Ontology for Urban Disaster Management: A Reinforcement Learning Approach to Adaptive Emergency Decision-Making	1005

Beyond emergency: shaping long-term resilience after the Emilia-Romagna floods	1006
Innovative Urban Futures: Songdo's Smart City Strategies for Disaster Resilience	1007

Track 13 | HOUSING AND SHELTER 1008

The Role of Community Land Trusts in Enhancing Affordability and Inter-generational Inclusivity in Urban Planning	1008
Comparing the impacts of specialized industries on housing prices between the regions: Case of the Seoul Metropolitan Area	1009
Understanding the Preference and Choice of Housing Environment for University Students in Metropolitan Areas	1010
How Housing Diversity Affects Urban Residential Segregation: The Tokyo Model	1012
Does regional planning really have an impact on urban development? Examining the effects of 50 French urban regional plans (SCoT) on housing construction and on building densities.	1013
Regeneration as an Approach for Upgrading Informal Settlement in Kam-pung Deret Petogogan	1014
The Social Reflections of Neoliberal Policies, Planning Legislation, and Housing in the Istanbul Metropolitan Area	1016
A NEW ACTOR IN TURKEY'S SOCIAL HOUSING PRODUCTION: THE CASE OF KİPTAŞ	1017
An Assessment on Provincial Differentiation of Housing Problem in the Turkish Case	1018
Collaborative Housing as a Tool for Reclaiming the Right to the City: Case Studies from France	1019
A Hierarchical Framework for Promoting Housing Justice and Social Equity through Adaptive Urban Design: A Case Study from Nanjing, China	1021
Using Geographic Information Systems to identify housing infill opportunities in Australian urban areas	1022
A Study on Per Capita Housing Status and Living Quality Enhancement in Dashilan Historical and Cultural Block	1023
The Socio-Spatial Implications of Urban Densification: The case of Oslo	1023
Milan inside-out: housing affordability and the extended urban region	1024
Transitional housing. Adaptive and Sustainable Design Strategies for Gaza Strip Reconstruction	1025
Housing Affordability in Europe - comparing housing markets and policies across Europe	1027
Social impacts of public housing redevelopment: experiences of citizenship in Hong Kong	1027
Intersectionality and Urban Regeneration in Post-Crisis Athens, Greece	1029
Converting commercial buildings to residential use: exploring health and wellbeing impacts from the deregulatory approach taken in England	1029
Housing Constructions and Urban Quality of Life: Findings from Istanbul Case	1031
The politics of housing informalisation	1032
From Housing Crisis to Housing Solutions: Municipal Planning Strategies and Regulatory Frameworks in Braga's Social Housing Sector	1033
Access to housing in the ecological transition. The relation between policies for the ecological transition and housing inequalities in Italy	1034
Collaborative Housing and Planning: Institutional Interfaces in the UK and Spain	1035

Echoes of a Company Town: ‘Vacant Giants’ as an Opportunity to Rethink Housing Affordability and Design	1036
From Residential Satisfaction to Neighborhood Satisfaction: A Conceptual Review and Framework for Clarity	1037
Local Practices Addressing Migrants’ Housing Precarity in the Veneto Region	1038
Future Housing: Essential Resources for Youth and Their Impact on Planning	1039
Regional Effects of Housing Shortages in Europe	1041
Predicting Housing Prices: The Case of Ankara Housing Market	1041
The third housing sector in Italy	1042
Displacement and Housing Affordability: Assessing the Economic Impact of Urban Redevelopment-Related Forms of Displacement	1043
NIGERIAN HOUSING DEVELOPMENT POLICIES IMPACT ON LAGOS HOUSING DEFICIT (1960 –2020): A Critical Literature Review	1044
Displacement Pressure in Vienna: Learning from Tenants’ Experiences for Policy and Planning Responses.	1045
Keeping it Real: Reconciling Housing Pressures and Economic Character in the Heart of the European City.	1046
Patterns of development and integration of new residential areas on the periphery of Moscow: post-urban growth strategies for space production	1047
Who governs housing policies? The challenges of housing governance between administrative decentralization and new forms of territorial governance in Europe	1049
Ownership Dynamics of Low-Income Households Under Iran’s Mehr Housing Policy (IMHP) (The Case Study of 13 IMHP Residential Complexes in Babol and Babolsar, Iran)	1050

Track 14 | ETHICS, VALUES AND PLANNING 1053

Classical versus Modern: Dissecting the Contemporary Swedish Architectural Debate	1053
Futureproof new towns: lessons in flexibility and indeterminacy	1054
Unveiling Justice Perceptions in Managing Pluvial Flood Risks	1055
Hybrid Spaces and Planning: Exploring Just City Debates in the Digital Era .	1056
Framing the Landscape, Concealing the Waste-scape	1057
Common Good as an Enduring Value in the Contemporary City Space . . .	1058
Psyche, telos and persona: discerning the voice of the planning discipline in an interdisciplinary age.	1060
Understanding Diverse Needs of Urban Dwellers to Improve People-Place Bonds for Inclusive Urban Planning	1061
A capability theory of spatial justice	1062
Participatory Planning in Brazil: a moralized approach to Sociospatial Justice	1063
Distributive justice in energy policy: Five theoretical perspectives on distributive justice applied to the case of the planning of renewable energy projects	1063
Decisions about decisions: process literacy as a tool to increase understanding of value conflicts in coastal decisions	1064
New Intelligent Technologies and Questions of Privacy and Surveillance for the Homeless	1065
Breaking through data monopolies: AI, open data, and transparency for just urban planning	1066
Planning for gender health justice: A scoping review and research agenda	1067
Geographies of commitment and voluntariness: Socio-spatial and normative structures of religion-based intentional communities	1067

Revisiting subsidiarity: Not only administrative decentralization but also multidimensional polycentrism	1069
Exploring the practices and perspectives of planning officers assessing applications for small-scale densification in suburban areas.	1069
Urban Beauty and the Open City	1070

Track 15 | PROPERTY MARKET ACTORS 1072

Social Network Actors in Farmland Market: Comparative Case Study between Japan and Scotland	1072
The financialization of actors, practices and instruments. Insights from Milano's Urban Market	1073
Undermining Planning in the Name of Housing: Portugal's Shift to Real Estate-Driven Rural Sprawl	1074
An Analysis on the Factors Affecting the Institutional Resilience of Housing Developers	1076
Characterizing the Black developer industry in Detroit: Challenges compared to other developers	1077
The Effectiveness of Public-Private Sector Collaboration in Regenerating Historic Industrial Brownfield Sites under Different Market Conditions	1079
The State as an Entrepreneur who Transforming Public Spaces: The Case of Zeytinburnu Fabrika-i Humayun	1080
Planning Transit-Oriented Development in Taipei City through the Assetization of MRT Development Zones	1081
Negotiated Planning in Brazil: From Comprehensive Planning to Deal-Making Cities	1082
A procedural approach to negotiated developer obligations: The case of Istanbul	1082
Becoming asset managers under institutional uncertainty: Local land governance in Ukraine	1084
The Process and Financialization Characteristics of Financial Institutions' Involvement in Renewed Rental Housing: Latest Cases from China	1085
Hacking the home: Prefabricated housing and new property regimes in residential property development	1087
Taxing away land take? The potential for development taxation as a NNLT planning tool	1087
Emotional work in relation to residential property investments and tenants –experiences from Finland	1088
Financialising Land: China's Urban-Rural Property Market Dynamics and Government Strategies in Planetary Urbanisation	1089
What - and who - do design guides regulate in the development of public land? The conflicting logics of Société des Grands Projets'property development, between rent maximization and exemplary urbanism	1090
The financialisation of planning through formal legislative change: the case of Ireland	1091
Planning and its spatiotemporal traps: rethinking economic value capture and governing capital flows within the United States	1092
Role of property-market intelligence channels in urban governance networks	1093
From sprawl to tall: Lessons from Kelowna, Canada as a blueprint for downtown intensification in mid-sized cities	1093

Track 16 | FOOD 1096

Exploring Food Deserts in Istanbul: Spatial Inequalities in Food Accessibility	1096

How Local Policies Transform Foodscapes, Influence Dietary Shifts, and Reduce Emissions: Insights from Six Mediterranean Sub-Regions in France	1097
Planning Beyond Food Emergencies: Healthy, Just & Resilient Places	1098
Re-thinking urban food systems through territorialisation and resilience: learnings from the COVID-19 crisis in Paris	1099
Universities Leveraging Surplus Food for Socio-Economic Inclusion in Cities: Lessons from the Off-Campus Initiative	1100
Empowering Women through Food Production from the Perspective of Cooperatives	1101
Understanding the role of diverse cities for sustainable food security: a socio-ecological governance framework	1102
Reclaiming the Peri-Urban Commons: Agroecology as a Pathway to Just and Sustainable Food Systems in Vicenza	1104
Care for food: choices and perceptions of food security and sustainability in a changing world	1105

Congress Opening Session

Congress Opening Session / 2084

Urban Political Ecology: Prefigurative Planning for a Climate emergency

In this talk I argue that Urban Political Ecology's (UPE) ontologies, epistemologies, and methods are not simply an academic exercise; they are scientific developments that make academic research more relevant to the politics of climate change. UPE unsettles 'traditional' understandings of 'cities' as ontological entities separate from 'nature', and develops methods to examine how urbanization is inseparably and metabolically interlinked with flows of capital, labour, and resources, and with the metabolism of the entire biophysical world. In the talk, I propose ways forward, to replace the currently dominant catastrophism over climate, with new forms of prefigurative politics and use values to promote socio-political action for 'impossible' solutions. I draw partly upon the books: *Turning Up the Heat: Urban Political Ecology for a Climate Emergency* (Kaika, Keil, Mandler and Tzaninis (eds), 2023; Manchester UP); and *Class Meets Land: the Embodied History of Land Financialization* (Kaika and Ruggiero, 2024, U of California Press)

Congress Opening Session / 2085

Planning Istanbul in Hard Times with(out) Great Expectations

The recently completed Vision 2050 Action Plan took as its starting point the intersecting global crises expected to define the 21st century, recognizing that their most dramatic consequences will be felt in metropolises like Istanbul. The Action Plan aims to address these vulnerabilities in order to create a more sustainable and resilient Istanbul.

In line with this perspective, the recently launched upper-scale planning initiative—namely, Istanbul Plan 2050—asserts that the aggressive and expansionist growth model that has shaped the city in recent decades is no longer sustainable due to the high social, geo-ecological, and economic costs it generates. Rather than preventing vulnerabilities, this model in fact amplifies them. While a number of mega-projects targeting ecologically sensitive zones well outside the built-up areas are being promoted, the existing built environment—and the lives of millions of Istanbul residents—remain under imminent threat from a major earthquake. Similar vulnerabilities appear in the form of the degradation of the environment and the ecological services as well as the inability to regenerate livelihoods for large segments of society caught in cycles of unemployment and social precarity and housing crises.

Rejecting the paradigm of so-called 'expansionism' and 'creative destruction'—which legitimizes opening up non-urbanized ecological areas to development and encourages redevelopment within the existing built environment—Istanbul Plan 2050 instead embraces a logic of compactness that centers on the reproduction, repair, and resilience of the urban fabric, while addressing accumulated damages and inherent vulnerabilities head-on.

Keynote Speakers

Keynote Speakers / 2086

Just Sustainabilities in Policy, Planning and Practice

Corresponding Author: julian.agyeman@tufts.edu

In his talk, Julian will outline the concept of 'just sustainabilities' as a response to the 'equity deficit' of much sustainability thinking and practice. He will explore his contention that who can belong in our cities will ultimately determine what our cities can become. He will illustrate his ideas with examples from urban planning and design, food justice and the 'Minneapolis Paradox'.

Keynote Speakers / 2087

The Paradoxical Potential of Interregnum: Exploring Opportunities for Transformative Planning in Times of Crisis

Corresponding Author: ayda@metu.edu.tr

As the ideological frameworks of post-neoliberalism and post-modernism approach their endpoints, we find ourselves in a transitional phase, a period Antonio Gramsci described as the interregnum, where the old order is dying but the new has yet to be born. This in-between moment, marked by uncertainty and disorientation, also holds the paradoxical potential for transformation. Contemporary planning discourses, which once aimed to serve bridging and corrective functions, have increasingly fallen short, remaining largely rhetorical and fragmented. In this context, the interregnum compels us to reimagine the role of planning in the face of systemic crises. Rather than seeking immediate solutions within the constraints of failing paradigms, we must instead foster collective imagination to conceptualise and construct alternative futures. This paper argues for a reorientation of planning thoughts toward a "post-neoliberal" ethos grounded in transformative, inclusive and anticipatory approaches that embrace the uncertainty of the interregnum as a generative space for systemic change.

Keynote Speakers / 2088

After Green Growth: Satiation As the Strategic Impulse for Spatial Planning

Corresponding Author: f.savini@uva.nl

Green growth is currently the dominant paradigm in spatial planning. This approach equates living standards with economic wealth and assumes that technological innovation can reconcile the increase of financial wealth with ecological targets. However, it is increasingly evident that green growth fails to achieve social and ecological objectives. Today, growth aggravates, rather than preventing, unprecedented levels of global inequality and ecological destruction.

Spatial planning has long been aware of these issues but has not changed course. Instead, it has confined itself, with limited success, to managing green growth. Planning promotes green, nature-based, circular, and smart innovations, to create economic resources to be then captured for social purposes. So far, however, this approach has failed to make essential services and spatial qualities more accessible or affordable. It has also fallen short of sustainability targets.

Instead, it has trapped planners in an endless cycle of fostering economic competitiveness on the one hand, while seeking to mitigate the negative social and environmental impacts of this process on the other. To address worsening affordability and ecological crises, planning tends to further increase the transfer of public wealth into private hands.

The talk will begin by exposing the limits of planning for green growth. It will demonstrate that the expansion of urban centers relies on the exhaustion of land and labor, both in affluent and in poorer regions. This has intensified the power divides between rich and poor, urban and rural, imperial core and periphery. Simultaneously, it has trapped planning in a vicious cycle of growth promotion and green management, which is increasingly difficult to navigate.

Next, the talk will introduce a new planning paradigm, which prioritizes satiation: the fulfillment of essential needs through the provision of essential services. Satiation refers to expanding essential services for the many by intentionally reducing excessive wealth and environmentally harmful activities. The focus on meeting needs can foster just and regenerative relationships between urban areas and their global hinterlands. Satiation is the core of both postgrowth and degrowth critiques of current economies.

The talk underlines that the need for satiation has gained momentum in planning and argues that planners have the tools already to bring this impulse to life. An increasing number of planning scholars and practitioners are aware of the limitations of their existing frameworks and toolkits. What is lacking, however, is the public and political support required to embrace an alternative planning paradigm: a strategic impulse. The talk will address this strategic challenge and explore pathways for institutional change that build on existing practices to create planning futures that overcome the limitations and impasses of green growth.

Keynote Speakers / 2089

The green transition challenge. Social and environmental inequalities in housing

In the last decades, we witnessed the development of a relatively new line of research on the role of welfare policies addressing the social consequences of the ecological crisis and of the green transition. Concepts such as sustainable welfare, just transition, or and eco-social justice, have been used to portray the challenges ahead and the need for a paradigm shift. The urgency to challenge the current unsustainable growth model went parallel to the need to explore and investigate how welfare policies should address societal needs within ecological limits and planetary boundaries. The presentation will explore this relationship addressing housing and environmental policies and their entanglements.

Networking Event

NETWORKING EVENT / 2090

GPEAN Networking Event: Housing in the Global South -Challenges and Opportunities for Planning Education

Organized by the Global Planning Education Associations Network (GPEAN)AESOP Annual Congress –Istanbul, July 2025

Housing remains one of the most urgent and complex challenges facing cities globally and mainly in the Global South. Despite sustained efforts, housing deficits continue to grow, shaped by rapid urbanization, climate vulnerabilities, social and spatial inequalities, land market pressures, and the increasing precarity of livelihoods. The global policy response, spearheaded by organizations such as UN-Habitat, has placed housing at the center of sustainable urban development agendas. Yet, planning education has often struggled to respond meaningfully to the scale, diversity, and political dimensions of the housing crisis across the Global South.

This 90-minute networking event, hosted by the Global Planning Education Associations Network (GPEAN), will bring together academic leaders from GPEAN member associations, scholars, and practitioners working on housing, but not only, to critically explore the intersection between housing challenges and planning education with a focus on the Global South. It aims to generate dialogue around the following key questions:

- How are planning curricula engaging with the realities of housing production, regulation, and everyday practices in the Global South?

What pedagogical innovations are emerging to address housing justice, informality, and affordability within planning programs?

- How can planning education contribute to more grounded, inclusive, and policy-relevant approaches to housing, in alignment with global agendas such as the New Urban Agenda and the Sustainable Development Goals?

The session will feature inputs and facilitate discussion and interactive networking among participants. It is envisioned as an open and informal space for exchange, and the identification of future collaborations among planning educators and researchers.

Held during the AESOP 2025 Congress in Istanbul—a city emblematic of many of the housing tensions faced across the Global South and North—this event also offers a timely opportunity to reflect on comparative insights and shared challenges in housing education globally.

By fostering connections across regions and disciplines, this networking session contributes to GPEAN's ongoing efforts to strengthen the global dialogue on planning education and to enhance its responsiveness to the pressing housing needs of our time.

Roundtable 1

RT_01 CO-CREATING THE 15-MINUTE CITY / 2040

CO-CREATING THE 15-MINUTE CITY - (Hosted within track 3: Mobility)

Author: Piotr Lorens¹

Co-authors: Astrid Krisch²; Hangwelani Magidimisha³; Jan Cudzik¹; Lucyna Nyka¹; Nurgul Yardim Mericliler⁴

¹ *Gdansk University of Technology*

² *University of Oxford*

³ *University Kwa Zulu Natal*

⁴ *Oxford Brookes University*

The concept of the 15-minute city has been widely discussed in literature and urban planning and design practice over the last few years. Emerging from the compact city idea, Carlos Moreno developed it further and transformed it into a more comprehensive vision. As a result, it caught the attention of researchers, local government leaders, and practitioners worldwide, with special attention paid to this in Europe.

The same applies to various approaches to public participation and the co-creation of contemporary cities. Coming from the original concepts emerging from the “ladder of participation”, they found their way to planning practice and have become some sort of a standard. In addition, the more developed concepts of co-creation of urban spaces have been developed.

However, there is still little experience in applying this co-creation philosophy to the process of shaping the compact, 15-minute city. In addition, there is also little connection between the process of shaping the 15-minute cities and employing the innovative tools, methods, and techniques associated with participation, including Augmented Reality and Virtual Reality based ones.

Within this session, there will be discussed issues in shaping the usage of these innovative tools, methods, and techniques associated with public participation in the process of shaping the 15-minute city and placemaking. In addition, the possibility of combining them with more traditional ones –including usage of the physical models and maps –will be discussed.

These presentations and follow-up discussions will be based on the preliminary results of the on-going Driving Urban Transition ENACT (Envisioning Neighbourhoods and Co-Creating Thriving Communities in the 15-Minute City) project based on four Urban Living Labs, organized in Trondheim, Gdansk, Valencia, and Oxford. The objectives of the project include:

1. To understand how co-creation methods and state of the art tools can be used in combination to achieve more inclusive, accessible, attractive and sustainable public spaces, streets and neighbourhoods.
2. To develop, test and validate physical and operational interventions that will influence people’s ability to use active transport in (sub)urban areas within the context of four different Urban Living Labs (ULL).
3. To disseminate recommendations for realizing the 15mC and identify how barriers to their implementation can be overcome, to maximize transferability and scalability.

As a result, the proposed round table will allow discussion on the creation of the people-centered 15-minute city and how digital tools can be associated with stimulating and enabling public participation and co-creation of space and placemaking.

Keywords:

Co-creation; 15-minute city; public participation; innovative participation tools

Roundtable 2

RT_02 WHAT IS NEW IN COMPARATIVE INTERNATIONAL PLANNING: WHY, WHAT, AND HOW? / 2041

WHAT IS NEW IN COMPARATIVE INTERNATIONAL PLANNING: WHY, WHAT, AND HOW?

Authors: Ela Babalik¹; Olivier Sykes²

Co-authors: Andrea Frank³; Bruce Stiftel⁴; Juliana Martins⁵; Manuela Madeddu²

¹ *Middle Eastern Technical University*

² *University of Liverpool*

³ *University of Birmingham*

⁴ *Georgia Institute of Technology (Retired)*

⁵ *Bartlett School of Planning, University College London*

Corresponding Authors: a.i.frank@bham.ac.uk, olivier.sykes@liverpool.ac.uk, ela.babalik.sutcliffe@gmail.com, m.madeddu@liverpool.ac.uk, j.martins@ucl.ac.uk, bruce.stiftel@design.gatech.edu

In this roundtable contributors to a forthcoming compilation - the Routledge Handbook on Comparative International Planning - will discuss the current state of the field of comparative international planning studies.

Comparative international planning research has a considerable history and the reasons for undertaking such work have been well rehearsed in the literature from at least the 1970s. The comparative impulse can derive from multiple and often complementary motivations. For example, from an interest in studying and learning from other places as means of general or personal enrichment; comparing the governance performance in different places (e.g. in meeting sustainability goals); studying different planning approaches and their effectiveness in addressing particular planning themes; improving understanding of different situations and planning contexts; developing theories or shaping and influencing agendas and supporting government lobbying. A distinct feature of international comparative studies in planning is that these are not the sole preserve of academics. In fact, there is a significant amount of comparative work being undertaken in planning practice both by the public sector as well as large international consultancies. Planning education is also characterised by varied methods of comparative international studies and the teaching and learning of the subject in Higher Education is explored by a section and contributions in the compilation with a particular emphasis on dissecting methodological approaches.

The roundtable will stimulate critical reflections across these three domains of planning - research, practice, education - including interrogations of power relations amongst global regions and the potential for the adoption of decolonial perspectives. Though it will highlight the value of adopting a comparative approach, it will also highlight its possible limitations. The roundtable will emphasise that a comparative approach must be grounded in a good understanding of the local context, and that the methodology adopted, level of analysis, scope, scale, language, transferability, and the direction of flow of ideas (considering the decolonial perspective mentioned above) all require considerable attention.

Roundtable 3

RT_03 RETHINKING DEMOCRATIC URBAN PLANNING: REFLECTING ON EQUITABLE AND ETHICAL APPROACHES FOR THE MULTI-CRISIS ERA / 1948

Rethinking Democratic Urban Planning: Reflecting on Equitable and Ethical Approaches for the Multi-Crisis Era

Authors: Ana Peric¹; Erhan Kurtarir²; Marco Pütz³

¹ *University College Dublin*

² *Yildiz Technical University*

³ *Swiss Federal Research Institute WSL*

Corresponding Authors: csamorgado@edu.ulisboa.pt, ana.pericmomcilovic@ucd.ie, savas.sahin@hbu.edu.tr, husar.milan@gmail.com, marco.cremaschi@sciencespo.fr, kurtarir@yildiz.edu.tr, marco.puetz@wsl.ch, erblin.berisha@polito.it, idil.akyol@msgsu.edu.tr, linda.fox-rogers1@ucd.ie

Despite a growing number of urban policies promoting multi-sectoral cooperation, robust theoretical foundations on collaboration, justice, and social inclusion, and emerging co-production, co-creation, and co-design approaches, adverse global political and economic trends continue to erode democracy in urban development. This erosion manifests in poor policy implementation, the critique of collaborative planning as a smoke-screen for unilateral decision-making, and the sporadic rather than systemic application of cooperative planning practices.

This roundtable examines the erosion of democracy in urban development as a critical challenge in the context of the multi-crisis era of the society, marked by climate change, economic instability, social inequality, and political polarization. A core consequence of this erosion is the contested legitimacy of urban planning. Instead of serving as a tool to protect the public interest, contemporary urban planning increasingly struggles against populist and authoritarian political regimes, as well as neoliberal economic pressures. Thus, we will explore the concepts and methods of democratic urban planning aimed at rebuilding public trust and reinvigorating planning as an essential tool for equitable and ethical urban development.

The discussion will address the following questions:

1. How can we comprehensively assess democratic urban planning across Europe, considering varied historical paths, planning traditions, and the interplay between global trends and local dynamics? Which stakeholders are essential to enabling democratic urban planning, and how can their roles be strengthened?
2. To what extent do various planning policies and practices emerge as democratic when examined through the lenses of formal planning frameworks (institutions and instruments) as well as cultural norms deeply embedded in society? How can we ensure that these frameworks and norms align with principles of justice, inclusion, and equity? How can we localise and operationalise the general frameworks?
3. How can we facilitate knowledge transfer across diverse social spheres? How can academic insights be translated into democratic planning principles, how can these professional tenets be integrated into citizens' daily lives, and how can deliberative planning tools become embedded in administrative and procedural frameworks to improve democratic urban planning?
4. What lessons can be learnt from comparing democratic and non-democratic approaches to urban planning, and how can ethical codes of urban planning ensure accountability in decision-making processes? How can ethical principles guide the transformation of urban planning practices globally, drawing on European experience?

By convening scholars and practitioners from diverse academic, cultural, and professional backgrounds, this roundtable will identify key barriers to implementing democratic and ethical principles in urban planning. It will also explore how lessons learned

from Europe can contribute a global agenda for equitable and sustainable urban development. The discussion will emphasise the need for new practical methodologies of urban planning to combat corruption, ensure inclusive planning, and rebuild public trust in planning institutions. Ultimately, this roundtable aims to open a path toward meaningful transformation by fostering dialogue, sharing best practices, and developing actionable recommendations for democratic urban planning in an increasingly interconnected and crisis-prone world.

Keywords:

planning; democracy; equality; ethics; global trends; formal planning; cultural norms

Roundtable 4

RT_04 RADICAL ALTERNATIVES TO CLIMATE URBANISM: TOWARDS SOCIALLY AND ECOLOGICALLY JUST CITIES / 1900

Radical alternatives to climate urbanism: towards socially and ecologically just cities

Author: Neelakshi Joshi¹

¹ *Leibniz Institute of Ecological Urban and Regional Development, Dresden*

Corresponding Authors: e.turhan@rug.nl, n.joshi@ioer.de, julian.agyeman@tufts.edu

Cities are critical sites for developing responses to climate change. However, popular climate change solutions in the city have not been successful in radically transforming the urban system. Celebrated climate change mitigations solutions like high-tech low-carbon buildings, electro-mobility and renewable energy remain materially intensive as well as socially exclusive. Similarly, adaptation efforts in cities largely address economically well-off areas, while increasing vulnerabilities for others. Cities continue to remain places of capital accumulation and unsustainability, creating inequalities within the city as well as beyond the city boundaries. While the critique of the mainstream idea of climate urbanism is now well established, open questions remain on alternatives that are socially and ecologically just.

Building on the theme of the Congress, "Planning as a Transformative Action in an Age of Planetary Crisis," this roundtable adopts a critical approach to climate urbanism and re-centre social and ecological justice at the heart of the urban response. We would like to learn from both material and social practices drawing from, but not limited to, perspectives of justice (spatial, social and ecological), degrowth, urban political ecology, urban social movements, post-development that challenge as well as create alternative solutions for infrastructure, housing, energy, food, mobility and greening within and beyond the city boundary.

In conversation with the contributors, we will discuss:

- a) Why is it necessary to re-center social and ecological justice in the urban response to climate change?
- b) What do alternative responses to building a just city look like?
- c) How do these alternative responses interact with existing urban planning practices?

The contributors, experts in thinking of justice and climate action together, will broaden the understanding of climate urbanism that is not limited to reducing greenhouse gas emission through techno-fixes, rather dares to address the systemic and root causes of unsustainability and build their responses from the ground up. The roundtable will lay the foundation for a special issue on the topic in the journals *Local Environment* or *npj Climate Action*.

Social; Ecological; Justice; Climate Urbanism; Alternatives

Roundtable 5

RT_05 CIRCULARITY AND/OR SUSTAINABILITY? IMAGINING TRANSFORMATIVE STRATEGIES AND ACTIONS FOR THE URBAN TRANSITION / 1955

Circularity and/or Sustainability? Imagining Transformative Strategies and Actions for the Urban Transition

Authors: Federica Scaffidi¹; Mina Di Marino²; Andresa Ledo Marques³

¹ *Leibniz University Hannover*

² *Norwegian University of Life Sciences*

³ *University of Lisbon*

Corresponding Authors: m.massari@unibo.it, andresa.marques@ics.ulisboa.pt, scaffidi@staedtebau.uni-hannover.de, mina.di.marino@nmbu.no

As cities face multiple challenges from climate change, rapid urbanisation, and resource scarcity, urban transitions have emerged as a critical framework for planning and re-thinking urban futures. Circularity and sustainability are pivotal in these transitions, offering transformative approaches to managing resources, fostering resilience, and creating more equitable urban systems. However, how do these concepts translate into actionable actions and strategies for urban development, and can they truly address the pressing social, economic and environmental crises cities face today?

This roundtable builds on AESOP 2025's theme of "Planning as a Transformative Action in an Age of Planetary Crisis", focused on environmental, social and economic global challenges by exploring the intersection and complementarity of circularity and sustainability. It seeks to provoke a dialogue that moves beyond technical solutions and engages with urban transitions' systemic challenges and opportunities. While circular economic models, adaptive reuse, and zero-waste initiatives have demonstrated localised success, this session interrogates their scalability, temporality, and inclusiveness. Are circular and sustainable urban models accessible to diverse communities, or do they risk perpetuating inequalities? And how do we balance the focus on circularity with the imperative to reduce overall consumption and rethink innovative growth paradigms?

Participants will engage with critical questions such as: How can circularity contribute to the broader goals of urban transitions? What governance frameworks and policy innovations are needed to align circular and sustainable actions and strategies? How do circular practices address socio-economic inequalities and promote inclusivity in urban spaces? What role do cultural and behavioural shifts play in advancing sustainable urban transitions?

The session will feature contributions drawing on theoretical insights and empirical research which investigates planning policies, strategies and practices, on one or more of the following topics:

- The intersection and complementarity of circularity and sustainability;
- Policy and governance innovations supporting circular and sustainable urban transitions;
- Case studies highlight both successes and limitations;
- The integration of circularity and sustainability with social justice and innovation in urban development;
- Circularity and sustainable nature based frameworks;
- Behavioural and cultural changes required for systemic transformation.

Aligned with AESOP 2025's theme of rethinking urban transitions, this roundtable aims to inspire new perspectives and actionable strategies for cities navigating the complexities of the 21st century. Critically examining circularity and sustainability through the lens of equity and innovation will foster a deeper understanding of the pathways to transformative urban futures. Together, we will explore how to translate circularity and

sustainability into inclusive, scalable, and impactful practices that redefine our urban future.

Keywords:

Circularity; Sustainability; Urban Transition; Social justice and innovation.

Roundtable 6

RT.06 LEARNING THROUGH INSTITUTING. IMPACTS OF CIVIC ACTION ON INSTITUTIONS AND THE POTENTIAL FOR THE PRODUCTION OF PUBLIC VALUE IN PLANNING / 1919

Learning through instituting. Impacts of civic action on institutions and the potential for the production of public value in planning

Authors: Elena Ostanel¹; Giusy Pappalardo²; Nadia Caruso³; Eva Álvarez de Andrés⁴; Alessandro Balducci⁵; Angela Barbanente⁶; Massimo Bricocoli⁵; Chandrima Mukhopadhyay⁷; Laura Saija⁸; Pablo Sendra⁹; Loris Servillo³

There has long been a debate on whether and how civic action can contribute to redefining the role and functioning of institutions. Institutional change is not merely a rational or regulatory process; it is a path of trial and error. This process can lead to changes not only in the set of rules, procedures and methods of labor division in a given organization but also in the actual system of power, affecting relationships of conflicting interests that drive institutional dynamics (De Leonadis, 2024).

Institutions can be seen as both cognitive and practical routines, embodied in the habitus of social agents, guiding their action along already marked paths shaped by the flow of past actions. They are therefore often taken for granted as they are, so much so that their inertia very often leads to an impoverishment of the cognitive repertoire of the actors themselves who compose it. However, this does not mean that they cannot change (Ibidem, 2024).

Institutions are supra-individual units of analysis, with properties that cannot be reduced to the aggregation of individual motives or interests (Powell, Di Maggio, 1991). Processes of learning and change strongly depends on the nature of institutions, which are products of intentional human action. This action does not occur in a vacuum, but it is immersed –anchored or embedded –in a socially and culturally structured field. Social ties, regulatory technologies, moral considerations, material objects and places influence how institutions and decision making processes occur (Lieto, 2013).

Focusing on institutional learning and change do not mean to shifting attention away from civic action. On the contrary, the potential for learning and change within institutions heavily relies on how civic action is organized, shaped, and infused with competencies and visions.

Despite for years, planning scholars have focused on the relationship between civil society and institutions (Friedmann, 2011) –ranging from collaboration (Healey, 1997; Forester, 1999) to harsh conflict (Huxley and Yiftachel, 2000; Miraftab & Wills, 2005), from coproduction (Albrechts, 2013; Balducci, Mäntysalo, 2013; Watson, 2014; Ostanel, 2024) to agonism (Mouffe, 2005; Purcell, 2008) –we think it is time for a step forward.

Based on these premises, this roundtable aims to understand the preconditions, mechanisms, and outcomes of learning processes within what have been defined as ‘instituting processes’ (Esposito, 2021; 2022; Li Destri Nicosia & Saija, 2023), emphasizing

the various impacts of civic action on the body of institutions and discussing the real potential for driving institutional change and the production of public value.

We seek scholars and researchers who aim to join us and discuss these main issues.

- How institutions of different kinds and at different levels can 'learn' in the field of urban transformations being confronted with civic action?

- What are the outcomes of this process of change in the institutional body, thus considered not only a procedural fact but a very complex environment made by routines, cultures, competencies, instruments and decision-making processes? What's the outcome on the production of public value?

- How is the potential learning relation organized and shaped and how possible routines or instruments be seen as facilitators/translators?

This roundtable is organized in the framework of the Project of National Interest PNRR 2022 RESISTING - REconnecting Social innovation with InSTitutions in urban planning.

Keywords:

planning; institutions; coproduction; conflict; civic actions

Roundtable 7

RT.07 CITY-MAKING BEYOND CRISIS MANAGEMENT: TOWARD JUST URBAN POLICIES / 1951

City-Making Beyond Crisis Management: Toward Just Urban Policies

Author: Laura Sobral¹

Co-author: Androniki Pappa²

¹ *University Institute of Lisbon (ISCTE-IUL), DINÂMIA'CET-Iscte, Centre for the Study of Socioeconomic Change and the Territory; Portugal | Vienna University of Technology (TUWien), URBAN –Interdisciplinary Centre for Urban Culture and Public Space; Austria*

² *University Institute of Lisbon (ISCTE-IUL), DINÂMIA'CET-Iscte, Centre for the Study of Socioeconomic Change and the Territory; Portugal*

Corresponding Authors: isabella_rusconi@iscte-iul.pt, ba.burcuates@gmail.com, predrag.milic@uniak.ac.at, sonja_dragovic@iscte-iul.pt, laura@laurasobral.com, androniki.pappa@iscte-iul.pt, mrola@arq.up.pt

Urban policies are not static—they evolve, adapt, and sometimes fade away. Their lifecycle is shaped by “middling actors”—urban professionals, activists, and bureaucrats—who navigate complex socio-political landscapes while co-producing and implementing policies, mediating between diverse stakeholders, and drawing on successful precedents. Yet, their work is fraught with tensions arising from land commodification, climate crises, and armed conflicts, all exacerbated by neoliberal urbanism and urban extractivism.

This roundtable critically examines the lifecycle of urban policies, the agency of those involved, and the conflicts they navigate. Inspired by Brazilian philosopher Nêgo Bispo's phrase: “*O começo, o meio e o fim*” (“The beginning, the middle, and the ending”), we propose a processual approach to urban policy design and implementation to explore negotiation, adaptation, and resistance.

1. Power Dynamics in Urban Policy Formation

Who are the middling actors, what are their positionalities, and how do they negotiate power within multi-level urban governance? How do policies emerge from these interactions, and how do unequal power dynamics shape or hinder inclusive decision-making? When does participation reinforce exclusion rather than fostering just urban policies?

1. How Urban Policies Travel, Adapt, and Move Forward

How do policies travel across different contexts while retaining their core values, and what role does political agency play in their adaptation? How can urban policies remain relevant in rapidly changing environments while overcoming power imbalances and institutional inertia? How do shifts in political power influence the interpretation and implementation of existing policies?

1. How Urban Policies Fade Out (or Not)

How can trust and stewardship be sustained beyond funding or political cycles? How to create policies for maintenance? What does a “good death” for a policy look like, and how can its lessons be carried forward?

1. Making Change: Towards Justice-Oriented Urban Policies

How can middling actors push urban policies beyond tokenistic participation toward structural transformation? What strategies can make city-making more equitable?

Drawing on feminist and Global South perspectives, this session explores creativity, trust-building, and collective vision in urban policy-making—while avoiding romanticised notions of participation and foregrounding the conflicts that shape urban transformation. Guided by the questions above, we will address various cases and discuss different scales and scopes of practices, from neighbourhood-level to ecosystem-level planning, considering the lifecycle of urban policies.

Within this roundtable, we will critically engage with how urban planning can shift from reactive harm mitigation to proactive justice-oriented practices, fostering policies for equitable and inclusive urban environments.

Keywords:

Urban Policy Lifecycle; Middling Actors; Power Dynamics; Justice-Oriented Urban Planning

Roundtable 8

RT.08 STRATEGIES FOR INCREASING HEAT RESILIENCE IN CITIES –WHERE DO WE GO FROM HERE IN PLANNING RESEARCH AND PRACTICE? / 1899

Strategies for increasing heat resilience in cities –Where do we go from here in planning research and practice?

Author: Gerard Hutter¹

¹ IOER

Corresponding Authors: mark.scherner@boku.ac.at, jasmin.uttner@tu-dresden.de, sapountzaki@hua.gr, g.hutter@ioer.de

Planning and preparing for heat stress and heat waves are high-priority issues in cities across Europe and elsewhere –at least in theory, if not in practice. Efforts of dealing with heat stress and heat waves are closely related to efforts of climate change adaptation as one component of climate policy (the other component being climate change mitigation). Increasingly, researchers seek to assess the state of art and activity level of cities with regard to climate policy in general, climate change adaptation in particular (e.g., see the survey of Otto et al. 2021 on German cities, Reckien et al. 2018, Galderisi et al. 2020, Reckien et al. 2023 on European cities, see Araos et al. 2016, Berrang-Ford et al. 2021, Fu et al. 2024 with regard to a global perspective).

Against this background, the Round Table addresses issues of strategies to increase heat resilience in cities from the perspective of strategic spatial planning (Healey 2009). The term resilience covers efforts of adaptive as well as transformative resilience. Input statements of researchers from Northern and Southern Europe provide insights into the state of work in cities like Athens, Dresden, Frankfurt, and Vienna. Input statements and contributions to discussion may refer to qualitative and quantitative research on planning (in the sense of small- and large-N research, Goertz & Mahoney 2012). The Round Table is organized to suggest some issues of high priority for future work in planning research and practice.

The concept of the digital divide was introduced and evolved in parallel with the development of the internet and, more broadly, the digital ecosystems that have shaped European societies over the past three decades. Several strands of research can be identified, each contributing to the evolution of this concept through complementary perspectives that have helped shape the multifaceted understanding attributed to the digital divide today. The digital divide has traditionally been understood and studied with a focus on individuals, social groups, or organizations. However, re-framing and interpreting this concept at a regional scale introduces a new set of challenges and opportunities for analysis. Much of this research is conducted at the national level, but such studies often fail to capture the complexity of regions as socio-institutional entities—a dimension that is typically better understood in studies focusing on nations or cities. Unlike nations or cities, regions require a more nuanced approach that considers their unique socio-economic, cultural, and institutional dynamics. This gap in research is particularly pressing, as the digital transition continues to transform how territorial and regional development is conceived and governed. The digital transition refers to the ongoing shift from traditional systems and practices to those driven by digital technologies. This process encompasses not only the adoption of digital tools but also broader transformations in economic structures, institutional arrangements, and social dynamics resulting from the integration of digital technologies into everyday life. Importantly, the digital transition unfolds differently across regions, sectors, individuals, companies, and public administrations, depending on varying local conditions and capabilities. While the concept of the digital divide can, to some extent, be conceived as decontextualized from specific geographical settings, the digital transition is always inherently tied to a specific territorial scale. The regional digital divide extends the concept of the digital divide to focus on disparities between regions or territories. These disparities encompass inequalities in access to digital technologies, the ability to utilize them effectively, and the socio-economic impacts of digitization. The way in which digital technologies are integrated into a particular region is shaped by the unique socio-economic and institutional characteristics of that region, making the digital transition a spatially contextualized process. This interplay highlights the need for approaches that integrate digital policies with territorial development strategies. Yet, planners often address these domains independently, leaving the digital policies to be set and implemented independently of territorial development. The main concerns: It is a shared vision that socio-economic development at the regional scale is consequent to the advancement of digital infrastructures and services, while the idea for a co-evolutionary vision would guarantee more efficient investments, equitable territorial attractiveness, and reduced territorial fragility. The roundtable aims at discussing how to develop research methodologies and policy approaches that can support such a co-evolutionary vision.

Keywords:

Digital divide; digital transition; territorial development

Roundtable 10

RT_10 URBAN LIVING LABS IN EDUCATION –HYBRID AND TRANSFORMATIVE SETTINGS FOR COLLABORATIVE LEARNING AND RESEARCH IN CITIES AND REGIONS / 1923

Urban Living Labs in Education –Hybrid and transformative settings for collaborative learning and research in cities and regions

Authors: Hendrik Weiner¹; Sinah Hackenberg¹

¹ *Brandenburg University of Technology Cottbus-Senftenberg, Chair of Urban Management*

Corresponding Authors: sinah.hackenberg@b-tu.de, hendrik.weiner@b-tu.de, stefania.crobe@unipa.it, finkenberger@fh-aachen.de, nissen@hs-nb.de

In recent decades, co-design and co-production working methods have been increasingly developed and tested in planning and architecture as an alternative approach to spatial production. These are still individual pilot projects. At the same time, the question of promoting this approach in education is being discussed and projects are being carried out in various living lab settings.

The roundtable will demonstrate the range of these practice-oriented educational approaches. The aim is to shed light on different aspects and to relate them to each other and to the “classical” world of planning and architecture. These range from the confrontation with practice right from the start of the projects to an active relationship between theory and practice. From working methods, organizational forms and structures, responsibilities in project work and laboratory operations. From inter- and trans-disciplinarity to openness and flexibility in teaching across university and institutional boundaries. From dimensions of collaboration in design and research. And last but not least, a new type of public-civil cooperation as a “third mission” in education through direct cooperation with communities, civil society or the local economy.

The roundtable will collect project examples, discuss structures and methods, tactics and strategies, and network interested stakeholders with the aim of strengthening co-educational approaches.

Keywords:

Urban Living Lab, Transdisciplinarity, Third Mission, Co-Production, Co-Education

Roundtable 11

RT_11 ROUNDTABLE ON CO-PRODUCTION OF KNOWLEDGE FOR TRANSFORMATIVE ACTION / 2042

ROUNDTABLE ON CO-PRODUCTION OF KNOWLEDGE FOR TRANSFORMATIVE ACTION –(Hosted within track 8: Education and Skill)

Authors: Anke Hagemann¹; Vivienne Mayer^{None}

Co-authors: Frank Schwartz²; Wolfgang Scholz³

¹ *TU Berlin, Habitat Unit*

² *TH Lübeck, University of Applied Sciences*

³ *TU Dortmund University*

Corresponding Authors: wolfgang.scholz@tu-dortmund.de, frank.schwartz@th-luebeck.de, vivienne.mayer@th-luebeck.de, anke.hagemann@tu-berlin.de

The escalating planetary crises, including climate change, rapid urbanization, and social inequality, underscore the urgent need for transformative actions in urban planning. To address these global challenges, the potential of interdisciplinary collaboration, knowledge co-production and cross-sectoral partnerships to create innovative solutions tailored to the diverse needs of communities is increasingly emphasized and explicitly stated in the Cairo Call to Action, which captures the key messages of the recent World Urban Forum.

In this roundtable, we will focus on universities' role in the co-production of knowledge building on the findings and networks established during the past four years of research under the international, transdisciplinary funding priority SURE –Sustainable Urban Regions, bringing together researchers and knowledge networks across Europe and Asia. One of the key takeaways from this research is that knowledge co-production in urban research requires transdisciplinary teams and integrated efforts to build knowledge grounded in local realities while addressing global challenges. Localized data plays a central role here, enabling communities to provide grassroots insights that inform and refine urban planning efforts.

Universities, as “engines of knowledge,” can play a pivotal role in supporting and involving communities in the generation, review, and analysis of data. However, effective co-production depends on mutual validation: local communities must review data to ensure relevance and accuracy, while open access, shared definitions and harmonized methodologies are necessary for comparability and to scale local impact across different regions. This inevitably raises the question about the transferability of knowledge – what can be transferred, and how, for example, methodologies can be adapted to different local conditions. These issues will be critically discussed in the roundtable by representatives of universities and knowledge networks with diverse international project experience.

To sum up, the roundtable will explore the challenges and opportunities of knowledge co-production in international urban research focusing on the role of universities and their networks. By emphasizing collaborative research that leads to tangible outcomes, the discussion will critically examine how universities can serve as catalysts for transformative action, driving progress through partnerships with local communities and policy-makers and fostering international knowledge exchange. The session aims to build an international network of urban researchers advancing knowledge co-production through innovative methods, tools, and strategies. By uniting researchers from diverse networks, we seek to form strong coalitions to contribute to the pressing global and interconnected challenges that cities worldwide face today.

Roundtable 12

RT.12 BEYOND THE PROCESS: DIFFICULTIES FOR THEORISATION WITHIN PLANNING RESEARCH AND PRACTICE / 2043

BEYOND THE PROCESS: DIFFICULTIES FOR THEORISATION WITHIN PLANNING RESEARCH AND PRACTICE –(Hosted within track 10: Theories)

Authors: Christopher Maidment¹; Martin Sondermann²

¹ University of Reading

² ARL –Academy for Territorial Development in the Leibniz Association

Corresponding Author: martin.sondermann@arl-net.de

This roundtable brings together contributors to the ARL Working Group; ‘Beyond the Process –Finding common ground for a discussion on planning’s substantial foundation’, to discuss the difficulties associated with grasping a common theoretical foundation for spatial planning.

Spatial planning activities often struggle for legitimacy in the face of populist politics, neoliberal forces and moves towards automation and digitisation, exacerbated by their often lacklustre contributions to addressing multiple crises (e.g. environmental, housing, economic etc.). Consequently, a lack of substantial theoretical foundation can be framed as undermining the discipline’s continued existence; without a substantial foundation how do we effectively communicate the positive contribution made by spatial planning and those that practice it in the face of such powerful forces? How do we communicate the importance of spatial planning to those who might be interested in practicing it in the future?

Reflecting on the importance of theory in educating future planners, John Forester writes about the normative role of planning theory:

“I take the task of planning theory only in part to do justice to the experience of contemporary planners facing the uncertainties, conflicts and political complexities they confront. But planning theory should do more: it should address possibilities for still better planning, possible directions for innovative work, avenues toward greater social welfare and lesser exploitation and domination, avenues toward lesser environmental degradation and toward more beautiful human environments. I take the challenge of planning theory to be not simply deconstructive, exposing false promises and self-serving rhetoric of ideologues, for example, but reconstructive, informing possibilities for human and environmental betterment.” (Forester, 2007, p.242)

Yet, the starting assertion for the roundtable is that our body of planning theories has become overly focused on procedural approaches, whilst being, simultaneously, often impracticable for practitioners and belying a lack of agreement amongst academics about what constitutes a substantial foundation for spatial planning. Starting from this premise, each contributor will discuss their perspective on the ‘sore spots’ of planning theory:

- What is missing or lacking from our current constellation of planning theory?
- Which aspects of spatial planning require further attention in planning theory?
- What theoretical approaches can move us away from the tensions between theories of planning focused on substance and procedure?

Ultimately, the roundtable aims to stimulate discussion around the state of contemporary planning theory and consider whether a common theoretical foundation for planning is possible or desirable.

Keywords:

Planning theory; substantive theories; procedural theories

Roundtable 13

RT_13 FUNDAMENTAL? OR BEST FORGOTTEN? CONTEMPORARY PERSPECTIVES ON THE PUBLIC INTEREST / 2044

FUNDAMENTAL? OR BEST FORGOTTEN? CONTEMPORARY PERSPECTIVES ON THE PUBLIC INTEREST

Authors: Christopher Maidment¹; Michael Lennon²

Co-authors: Angelique Chettiparamb¹; Ben Clifford³; Hanna Mattila⁴; Stefano Moroni⁵; Akif Burak ATLAR⁶

¹ University of Reading

² University College Dublin

³ University College London

⁴ University of Turku

⁵ Politecnico di Milano

⁶ President of the Chamber of Planners of Türkiye

The concept of the public interest has long been bound up in debates about the purpose of, and justification for, planning activities. Yet, writing at the beginning of the 21st Century, Campbell and Marshall (2000) highlight that:

“What constitutes the public interest has always been contentious but its value as a legitimising concept has been increasingly called into question in the recent past. It is a term which has often been used to mystify rather than clarify...it is frequently used as a device to cast an aura of legitimacy over the final resolution of policy questions where there are still significant areas of disagreement.”

(Campbell and Marshall, 2000, p.308)

The concept is simultaneously a carrier of many meanings and of no meaning; its inherent lack of content beyond the vague notion of serving the public leaves it open to being appropriated for less than normative purposes and, despite a lineage debating back to Aristotle, its practical application remains contested. On the other hand, it remains a justification for action that the discipline of planning clings onto; without a remit to serve the public what reason is there for spatial planning to exist?

Using the theory and practice of spatial planning as a basis, the aim of this roundtable is to present a range of contemporary perspectives, some optimistic, some less optimistic, about the relevance of the concept as we move further into the 21st Century. Each contributor will be asked to respond to the following questions:

- Does/should the public interest remain a relevant as a conceptual basis for spatial planning?
- How should the public interest be theorised or conceptualised?
- Is the public interest a relevant concept for practitioners?
- To what extent is a consensus needed around who or what constitutes the public?

Some contributions will focus on the relevance of the concept in practice, whilst others will explore how the theorisation of the public interest has evolved. Specifically, we want to draw out the contrasts and dissensus between viewpoints and generate debate about whether the public interest remains an important foundation for planning theory and practice.

Keywords:

Public Interest; Planning Theory; Planning Practice; Legitimacy

Roundtable 14

RT_14 PROJECT MANAGEMENT IN CROSS-BORDER INITIATIVES: PRACTICES, CHALLENGES AND OPPORTUNITIES / 1958

Project management in cross-border initiatives: practices, challenges and opportunities

Author: Nataliia Yehorchenkova¹

¹ SPECTRA Centre of Excellence EU at Slovak University of Technology in Bratislava

Corresponding Author: nataliia.yehorchenkova@stuba.sk

This roundtable will focus on the role of project management in addressing the challenges faced by EU cities, with a particular emphasis on cross-border urban projects. As cities contend with pressing issues like climate change, energy transition, digital transformation, and sustainability, effective project management is important for fostering collaboration, optimizing resource use, and achieving long-term goals.

Project management frameworks, based on global best practices, provide structured approaches, method, models and tools to planning, executing, and completing projects efficiently within defined timeframes and budgets. Frameworks such as Agile, PRINCE2, and PMBOK are effective in managing resources, risks, stakeholder and team collaboration. They incorporate planning and monitoring tools, such as Gantt charts, project dashboards, and key performance indicators, to ensure tasks are scheduled, tracked, and adjusted as needed. By utilizing these frameworks and tools, projects can maintain clear timelines, monitor progress, and address complex challenges effectively while delivering practical, sustainable results.

The discussion will highlight how management practices can bridge gaps between stakeholders, align diverse interests, and ensure that urban initiatives deliver sustainable and equitable outcomes. From the project management side the discussion can emphasise specific project management tools and approaches that fit best the needs of EU cross-border projects. It will also delve into the complexities of managing urban transformation projects in the EU, for example how cities must navigate a variety of regulatory frameworks, cultural differences, and competing priorities. Topics will include how to overcome governance fragmentation, address funding uncertainties, and drive innovation to build resilient and inclusive urban spaces.

Key topics for discussion include:

- Best practices in managing cross-border projects.
- Governance, funding, and stakeholder coordination challenges.
- The use of project management tools and methods to improve project outcomes.
- Lessons from successful EU urban projects and partnerships.

Keywords:

Project Management, Urban Transformation, Cross-Border Collaboration

Roundtable 15

RT.15 PLANNING PROFESSIONALISM AND RE-BUILDING TRUST IN A POST-TRUTH ERA / 1904

Planning professionalism and re-building trust in a post-truth era

Author: Hannah Hickman¹

¹ *University of the West of England*

Corresponding Authors: hannah.hickman@uwe.ac.uk, jasper.devries@wur.nl, katie.mcclymont@uwe.ac.uk

This roundtable will look at trust in planning and trust in planners with a focus on professionalism and expert knowledge in a populist, polarised “post-truth”, era, where the sense of “public interest” remains vital but is in dispute. In a broader international context, trust in institutions and experts is often deemed to be under pressure. However, looking more closely to trust in institutions studies show that this is only true among specific groups in society (e.g. those geographically far from governments seats, marginalized groups etc.). However, exemplified by traditional and social media, feelings of distrust of an ongoing crisis in trust in institutions and experts effect planning and planners. Especially, as trust in planning matters because planning is at the heart of increasingly contentious –and at times polarising - debates about tackling global challenges around climate, access to housing, health, and inequality. This round table, It will enable critical consideration of the commonalities and differences in the role of planning and the planner in different contexts.

It will draw on divergent experiences in the Netherlands, South Africa and the UK outline differing relationships with residents, governments and knowledges; to seek commonalities and difference between practice and practitioners. We seek new framings of how relationships of trust vary over time and context, and aim to add more conceptual and empirical depth to these questions of key social and academic importance.

Critically, this discussion aims to explore how and if we can learn through international comparison to re-building trust, critical for ensuring planning’s positive role in tackling key global challenges.

Roundtable 16

RT_16 POST-GROWTH, OR THE RETURN TO THE FABULOUS FIFTIES? EVIDENCE OF FUNDAMENTAL CONTRADICTIONS BETWEEN THEORY AND PRACTICE OF PLANNING / 1959

"Post-Growth, or The Return to the Fabulous Fifties? Evidence of Fundamental Contradictions between Theory and Practice of Planning

Author: Barbara Pizzo¹

¹ *Sapienza Università di Roma*

Corresponding Authors: jin.xue@nmbu.no, silvio.cristiano@unifi.it, barbara.pizzo@uniroma1.it, f.savini@uva.nl, antonio.raciti@umb.edu, angela.barbanente@poliba.it

Despite growing recognition of environmental and social challenges requiring a shift from traditional development paradigms, planning tools and practices remain fundamentally growth-oriented, largely unchanged from their mid-20th century features. This contradiction manifests differently across planning traditions and national contexts.

Across Europe, from South to North, we see that in major Italian cities like Rome and Milan, while explicit suburban expansion has declined, the "zero soil consumption" rhetoric (similar to "no net land take" policy in EU and "land use neutrality" Initiative in Norway), masks a continued prioritization of private development interests similar to 1950s practices. This perpetuates traditional pro-growth patterns through density maximization, green space reduction, and regulatory exemptions that favor private property owners over public planning objectives. Moreover, this seemingly degrowth strategy is evidently used to greenwash and legitimize growth-oriented agenda. Norway presents an interesting contrast between urban and rural contexts. Major cities experience "spontaneous" growth driven by economic and demographic trends, requiring no special stimulation. However, rural municipalities actively promote development through permissive regulations and simplified land conversion processes, essentially using planning policy to attract growth.

Common patterns emerge across different countries, even as urban growth shifts from expansion to densification: Frequent plan exemptions and derogations; Maximized building density; Inadequate provision of green spaces; Developer-driven location choices; Compromised collective space programming. Despite environmental messaging, contemporary urban development practices continue to prioritize private interests and deregulation, much like during the post-war building boom. This approach fundamentally contradicts stated objectives of addressing socio-environmental crises.

The key question becomes: How must planning tools evolve from their "Fabulous Fifties" origins to effectively implement different paradigms? Specifically, how can planning systems be redesigned to pursue objectives of sufficiency, reduction, and downscaling, rather than perpetual growth?

Pro-growth Post-growth Paradigms; Planning Theory and Practice; Post-growth Transition in Planning

Roundtable 17

RT_17 DEMONSTRATING THE APPLICATION OF DIGITAL TWINS IN URBAN PLANNING: ENSURING CITIZEN CENTRIC IMPACT / 1956

Demonstrating the Application of Digital Twins in Urban Planning: Ensuring Citizen Centric Impact

Authors: Aoife Doyle¹; Razgar Ebrahimi²; William Hynes¹

¹ KPMG Ireland

² Danish Technological University

Corresponding Authors: benedetta.barchi@rina.org, william.hynes@kpmg.ie, mani.dhingra@adaptcentre.ie, raze@dtu.dk, ivy@oascities.org, aoife.doyle@kpmg.ie, martin.traunmueller@ait.ac.at, john.sheils@kpmg.ie

Digital Twin (DT) technology revolutionises urban and spatial planning, providing dynamic, real-time digital replicas of physical environments. This technology enables planners to simulate, analyse, and optimise urban spaces. By integrating data from various sources, such as models, sensors and IoT devices, DTs offer a comprehensive view of urban systems, facilitating informed decision-making.

Incorporating Artificial Intelligence (AI) and data analytics, DTs can predict and maximise opportunities within cities, including areas of growth, locations for investment, and mitigate traffic congestion, pollution, and infrastructural damage. This AI synergy enhances the accuracy and efficiency of urban planning, ensuring sustainable and resilient cities.

This proposed roundtable session draws on lessons from multiple European Commission funded DT research projects from across Europe including BIPED (Building Intelligent Positive Energy Districts), TIPS4PED and Twin4Resilience.

Reflections from BIPED, funded under Horizon Europe, will demonstrate how DTs assist urban planners in navigating the energy transition and decarbonisation requirements within their city/urban environments. BIPED's ambition is to manage this transition by developing and scaling Positive Energy Districts (PEDs), a key building block in achieving city-wide climate neutrality, in the city of Aarhus, Denmark (and other cities in turn). At the core of the solution lies the advanced digital twin technology complete with AI-driven optimisation tools for better urban planning and citizen engagement.

TIPS4PED is a Horizon Europe project designed to showcase an Integrated Assessment Platform (IAP) that will help municipalities in the creation of PEDs. This platform will empower cities to make informed decisions by enabling the design, development, and efficient management of PEDs using DT technology. With an intuitive dashboard, users can easily visualise different scenarios and results. Furthermore, the TIPS4PED platform will incorporate AI-driven modules, designed to optimise the creation and management of PEDs, while also integrating smaller-scale management tools like Building Management Systems (BMS) to enhance overall performance.

Twin4Resilience (T4R), INTERREG North-West Europe co-funded project, brings together 14 partners from 6 European countries to explore the use of Local Digital Twin (LDT) for a wide variety of applications in urban areas. Moving away from technology-driven solutions, T4R focusses on wider uptake of LDTs through a jointly developed resilient implementation strategy comprising 4 transformative frameworks –technical design, governance, ethics/inclusion/democratisation, and training. Dublin, one of the pilot and frontrunner cities, will highlight various challenges and ethical dilemmas which need to be addressed before/during the implementation of LDT projects and use cases. It will also share best (data) governance practices for an inclusive and democratic approach to LDTs.

This roundtable will explore how applied methodologies facilitate the development of smart, sustainable societies by enabling precise modelling and simulation of urban environments. Our roundtable consisting of DT experts and urban/ spatial planners will explore how DTs can enable urban planners and other built environment specialists to predict and optimise energy usage, reduce emissions, and enhance the overall quality of urban life for the betterment of the citizens and the whole of society.

Digital Twins; Smart Cities; Positive Energy Districts

Roundtable 19

RT_19 CITY, DIVERSITY AND TOLERATION: THE LEGAL AND POLITICAL GEOGRAPHY OF PLURALISM / 1940

City, diversity and toleration: the legal and political geography of pluralism

Authors: Francesco Chiodelli¹; Stefano Moroni²

¹ *Interuniversity Department of Regional and Urban Studies and Planning, University of Turin*

² *Polytechnic University of Milan*

Corresponding Authors: hama@create.aau.dk, m.t.tasankok@uva.nl, carlo.fabian@fhnw.ch, stefano.moroni@polimi.it, nufar.avni@polito.it, francesco.chiodelli@unito.it, viderman@b-tu.de

The roundtable arises from the conviction that the issue of “pluralism” –and the connected question of toleration –is today, more than ever, a crucial theoretical and practical problem in need of critical debate. The roundtable discussion is based on the recently published book “The Legal and Political Geography of Pluralism Supporting Diverse Public and Private Spaces in Contemporary Cities” (2025), by Francesco Chiodelli and Stefano Moroni. This book addresses questions of pluralism in a time of increasing ethnic, religious and cultural diversity in the public and private spaces of our cities, by analysing different types of regulation –property rights, municipal ordinances and urban planning. In the same vein of the book, the roundtable reflects on the kinds of rules public institutions should adopt in relation to “private spaces” as well as which ones they should promote in relation to “public spaces” in order to protect and support pluralism.

Keywords:

Toleration, diversity, public space, pluralism

Roundtable 20

RT_20 AESOP-INDIA PLANNING EXCHANGE: TOWARDS GLOBAL NORTH-SOUTH RELATION IN KNOWLEDGE PRODUCTION / 1917

AESOP-India Planning Exchange: Towards Global North-South relation in knowledge production

Authors: Chandrima Mukhopadhyay^{None}; Qingyuan Guo¹

¹ *London School of Economics*

Corresponding Authors: cmukhopadhyay22@gmail.com, bruce.stiftel@design.gatech.edu, q.guo11@lse.ac.uk, lucy.natarajan@ucl.ac.uk, suro@iitd.ac.in, yiftach@bgu.ac.il

The roundtable is proposed at the background of the AESOP International PhD Workshop in India in 2026. In the past, AESOP members have advocated for learning about planning education and practices from countries/continents beyond the boundary of Europe, and especially from the Global South and East countries. One of the main aims of forming the Global South and East thematic group was that the budding planners of AESOP has a lot to learn from the complexity of the Global S&E countries. The international workshop is a step towards that direction with innovative pedagogy. The focus of the workshop will be on the proposed eleven industrial and economic corridors in India. While such corridors are not always about planning, in Indian context, these corridors are the catalyst for rapid urbanisation, economic development, and are strategic and spatial planning tools. With this background, we will frame our discussion around the following questions:

- a. Why India is a significant location for such an international workshop from an urban and regional planning perspective? (Chandrima Mukhopadhyay, Coordinator of Global S&E Thematic group)
- b. An in-depth explanation of Indian planning practices (and urbanisation process); (Sandip Chakravorty, Indian Institute of Management Ahmedabad)
- c. The legacy of hosting an international workshop for AESOP and YA; (YA CT member-name TBC)
- d. The importance of bringing multiple international development organisations on board to collaborate; (Chandrima/Bruce Stiftel, Georgia Institute of Technology, US)
- e. What is the implication of the workshop for the Global North- South relationship in terms of knowledge production about south, research grants, publications about southern urban issues in international high-impact journals etc? (Bruce Stiftel & Oren Yiftachel, Ben-Gurion University of the Negev, in Beersheba & Honorary Professor at UCL)

The discussion could conclude with a presentation on the format of the workshop including pedagogy, and locations.

⁹ *Politecnico di Milano*

Corresponding Authors: marco.cremaschi@sciencespo.fr, jan.schreurs@kuleuven.be, donato.casavola@polito.it, j.waldenberger@uva.nl, camilla.perrone@unifi.it, emp.pache@gmail.com, valeria.fedeli@polimi.it, tosics@mri.hu, karsten.zimmermann@tu-dortmund.de

The challenges regarding European Metropolitan Regions are growing in these times of a polycrisis: climate change adaption, the energy transition and a turn towards a post-carbon-economy, and variegated socio-economic and spatial fragilities, are all building up stress levels in those regions. What happens in the 'power houses' of modern urban societies, and how can we navigate these areas between strategic positioning and providing everyday life worlds? How are urban policies coping with these challenges, and what impact does the Next Generation EU policy play in addressing transformations and transition?

The RT will address related issues in a critical inquiry but also by outlining some pathways to the future of the European Metropolitan Space. Against this backdrop, the RT intends to explore three dimensions of the current transition, focusing on the nature of the game changer and the possible implementation mechanisms for innovative policy and planning responses: Urban policies dimension: Is there enough understanding of the configurations of socio-spatial-ecological formations that result from the processes of territorialisation, deterritorialization and reterritorialization within the pathways of contemporary capitalism(s)? Spatial imaginaries: What are the new spatial imaginaries, either produced by experts and institutions at EU level, but also by people, as collective constructions with a performative and normative role, in response to the 'polycrisis'? Pathways to the future of the European Metropolitan Space:

Which conceptual and methodological challenges result for public policies and planning, as conceived so far? Which scenarios can be sketched for the future of the metropolitan regions in the coming decades and under what enabling conditions can policy and planning foster just and sustainable urban regions?

The RT will bring together authors contributing to a special issue for Territory, Politics, Governance.

Roundtable 22

RT_22 LIVING WITH WATER AT THE TIME OF MULTI-RISK CONDITIONS / 1902

Living with water at the time of multi-risk conditions

Authors: Denis Maragno¹; Paolo De Martino¹

¹ IUAV

Corresponding Authors: a.sarkar-4@tudelft.nl, t.a.daamen@tudelft.nl, eferraioli@iuav.it, pde-martino@iuav.it, bruna.vendemmia@unina.it, c.m.hein@tudelft.nl, dmaragno@iuav.it

The interconnected risks faced by water cities—such as river basins, deltas, lagoons and coastal landscapes—require integrated approaches that transcend traditional planning methods and administrative boundaries. These areas, marked by ecological fragility and social vulnerability, are emblematic of the need for multi-risk and multi-scale adaptation strategies. Accelerating climate change exacerbates existing geological, hydrological, and environmental hazards, while anthropogenic pressures amplify the challenges, creating additional layers of complex to deal with risks. Despite decades of effort, the reliance on outdated planning frameworks and insufficient localized knowledge has hindered policymakers from effectively addressing these risks. This gap has led to unsustainable urban growth, escalating social inequalities, and intensifying environmental threats. A rethinking of urban metabolism and governance models is essential to foster circular development and future resilient scenarios. This contribution proposes a transformative methodology, developed within the PNRR-financed MIRACLE project, which integrates multi-risk analysis, vulnerability mapping, and scenario development into experimental urban laboratories. By leveraging tools such as community engagement, gaming, and artificial intelligence (AI), these laboratories foster collaboration among diverse stakeholders to co-design adaptive strategies. We invite contributions that address the complexities of multi-risk conditions, focusing on innovative frameworks that integrate spatial, social, and technological solutions. How can water cities adapt to evolving hydrological risks while promoting inclusivity and ecological balance? Contributions may explore methodologies, case studies, or governance models to advance knowledge and practice in multi-risk planning.

Keywords:

multi-risk planning; water; climate change; scenario thinking; adaptive strategies

Roundtable 23

RT_23 NEIGHBORHOODS FOR TRANSFORMATIVE ACTION / 1935

Neighborhoods for Transformative Action

Authors: Serap Kayasü¹; Sila Ceren Varış Husar²; Burcu Halide Çingir Özüduru³; Deniz Altay Kaya⁴; Milan Husar²; Bilge Serin⁵; Mina Di Marino⁶; Dea Buza⁷

⁵ *Glasgow University*

⁶ *Norwegian University of Life Sciences*

⁷ *Agricultural University of Tirana*

Corresponding Authors: denizkaya@cankaya.edu.tr, bozuduru@gazi.edu.tr, milan.husar@stuba.sk, kayasu@metu.edu.tr, mina.di.marino@nmbu.no, bilge.serin@glasgow.ac.uk, dbuza@ubt.edu.al, sila.husar@stuba.sk

Neighborhoods are more than mere physical spaces; they are dynamic socio-spatial assemblages that reflect the interplay of identity, diversity, and community while serving as key loci where space and society become tangible. Often overlooked in urban planning, neighborhoods are increasingly recognized as critical platforms for addressing today's multifaceted crises, such as climate change, social inequality and public health crises. Serving as the nexus between individual households and broader urban systems, neighborhoods hold unparalleled potential to shape the future of cities through local governance and social interaction with the advantages of proximity and interdependence.

The diversity of European neighborhood experiences and how neighborhoods can foster resilience, encourage participation, and drive community transformation will be explored in this roundtable. By fostering cross-country dialogue within Europe and its wider region, urban planners and policymakers can utilize diverse approaches to address challenges and enhance neighborhood-driven transformation.

Transformative actions at the neighborhood level hinge on bridging grassroots initiatives with top-down policies. Collaborative governance models demonstrate the potential of integrating citizen-driven innovations. The roundtable will focus on three themes:

1. **Participation:** Neighborhoods provide accessible platforms for community engagement, enabling residents to co-create solutions and influence decision-making processes. The panel will explore strategies that empower marginalized groups, amplify local voices, and bridge the gap between top-down policies and grassroots initiatives.
2. **Resilience:** Neighborhoods are essential for fostering resilience in economic, social, environmental and governance crises. Panelists will present examples of adaptive strategies that promote social cohesion, mutual support, and long-term recovery.
3. **Transformation:** Beyond resilience, neighborhoods can act as laboratories for transformative change. Discussions as digital technologies, data-driven tools and urban labs will highlight how neighborhoods redefine urban living, foster innovation, and create inclusive, equitable futures.

Panelists will provide insights from Türkiye, Central and Eastern, Western, Northern and Southeastern Europe and the Balkans:

- **Türkiye:** Exploring the dimensions of community resilience, the ability of communities and neighborhoods in navigating multiple crises.
- **Central and Eastern Europe:** Highlighting neighborhood dynamics in post-socialist urban contexts shaped by unique historical and cultural factors.
- **Western Europe:** Showing innovative, community-driven, participatory approaches to sustainability and governance.
- **Northern Europe:** Resource sharing focusing on a reshareability index for sustainable planning and 'reshared' neighborhoods to apply circular principles.

- Southeastern Europe and the Balkans: Offering comparative insights to broaden understanding and applicability.

In the quest to transform the neighborhood from being a passive policy recipient to becoming an active change agent, panelists will provide economic, social, environmental and governance frameworks and case studies that will lead the redefinition of the neighborhood in spatial planning.

The roundtable outcomes are envisioned to have significant implications for the 2025 Ankara Urbanism Biennial organized by İlhan Tekeli Urbanism Culture Trust, offering a comprehensive understanding of neighborhoods as critical sites for fostering inclusivity, resilience, and adaptability in urban environments. By synthesizing insights from diverse contexts, the roundtable will help identify key themes for the biennial, ranging from social equity and grassroots democracy to sustainability and urban innovation. Finally, an edited volume will consolidate theoretical and practical knowledge on neighborhoods as essential building blocks of urbanism.

Neighborhoods; Transformative Action; Sustainability; Resilience; Participation

Roundtable 24

RT_24 HAS THE PANDEMIC BOOSTED INNOVATION? EXPLORING URBAN TRANSITIONS / 2045

Has the pandemic boosted innovation? Exploring urban transition

Authors: Camilla Perrone¹; Valeria Fedeli²

Co-authors: Federica Fava³; Flavia Giallorenzo⁴; Flavio Martella⁵; Giovanni Caudo⁶; Giulio Giovannoni¹

¹ *University of Florence*

² *Politecnico di Milano*

³ *Roma Tre University - Department of Architecture*

⁴ *Università degli Studi di Firenze*

⁵ *Università degli Studi Roma3 - Department of Architecture*

⁶ *University of Roma Tre*

Corresponding Authors: flavio.martella@uniroma3.it, flavia.giallorenzo@unifi.it, camilla.perrone@unifi.it, giovanni.caudo@uniroma3.it, valeria.fedeli@polimi.it, federica.fava@uniroma3.it, giulio.giovannoni@unifi.it

The COVID-19 pandemic created a brand new social, economic, urban environment. Actors, at any scale and nature (public, private, firms, associations...), experienced completely unpredictable contingent situations and indefinite horizons. The fuzziness of the situated exigences was concurrent with the strictness of the policy and laws to limit the spreading of the virus. In the frame of transition studies and the spatial turning literature, the round table discusses what followed the pandemic shock, evidencing hints from case studies and theoretical reflections on transitions. The aim is to debate changes in times of poly-crisis, and if those have the potential for a permanent restructuring of spatial practices and imaginaries. Evidence from case studies at the table will discuss the role of the space in recovery policies with respect to four specific sectors (cultural and leisure activities and tourism; people and goods' mobility; higher education; manufacturing activities), while the theoretical contributions will reflect on (possibly new) roles and approaches in planning theory to deal with the post-pandemic poly-crisis and transitions.

In the frame of a National Interest Research Project ("Plastic or elastic? Exploring the spatialities of post-Covid 19" coordinated by Valeria Fedeli, Politecnico di Milano), the organisers put on the (round) table the following questions:

1. What role have the crises, here namely the pandemic by COVID- 19, in restructuring the relations of people, firms, and institutions with spaces?
2. Do the crisis and the externalities produced by them have an impact on innovation? Which actors and which fields are more responsive in these processes? And if so, which role has the space in prompting or experiencing innovative practices?
3. What is the role of the public in enabling or disabling new relations of actors with the space for boosting innovation?

Results of the RT will be valorised in the deliverables of the Research Project. Moreover, depending on the interest and results of the discussion, the organisers will draft a theoretical manifesto to challenge Italian policymakers and actors coping with systemic disruptive change by generating collaborative governance of transition space.

Keywords:

Transition studies; crises, space; governance; innovation

Roundtable 25

RT_25 UGOVERN: FROM POLICY TO PRACTICE: INNOVATIVE REGULATORY TOOLS FOR ADDRESSING THE AFFORDABLE HOUSING CRISIS / 1945

UGoveRN: From Policy to Practice: Innovative Regulatory Tools for Addressing the Affordable Housing Crisis

Authors: Ebru Kurt-Özman¹; Nuno Travasso²

¹ *University of Amsterdam*

² *University of Coimbra / University of Porto*

Corresponding Authors: e.kurtozman@uva.nl, m.t.tasankok@uva.nl, ayda@metu.edu.tr, gerkut@gmail.com, a.j.legarza@uva.nl, nuno.travasso@uc.pt

The roundtable we propose will explore innovative regulatory tools and practices addressing the affordable housing crisis within fragmented governance systems, with a focus on their implementation, benefits, and challenges in diverse country contexts. While housing market trends and urban development processes vary significantly across nations, this session aims to foster a comparative analysis of actionable policy instruments that have demonstrated potential to stimulate affordable housing production while addressing equity and sustainability goals.

In the context of the global housing crisis, particularly in the Netherlands, Turkey, Portugal, the U.S., and France, discussions on the most effective public policies and planning tools have gained urgency. A nuanced analysis of specific regulatory approaches within these fragmented governance systems is essential to formulating innovative strategies. This roundtable will pursue three key objectives:

- 1) Highlighting Innovative Tools:** Exploring specific regulatory instruments and policies being used to address the housing crisis in different contexts.
- 2) Evaluating Contextual Effectiveness:** Understanding the conditions under which these tools operate and the factors influencing their success or failure.
- 3) Fostering Adaptability:** Discussing the potential for adapting and scaling these tools across diverse governance systems while respecting contextual specificities.

Additionally, the roundtable will aim to establish a set of key metrics and issues to support future comparative research, potentially leading to a broader international publication on this theme, comprising a larger number of countries.

Structure of the Roundtable

1) Introduction and Comparative Data

The session will begin with a brief overview of the affordable housing crisis and its relationship with fragmented governance systems across the different case studies. A comparative statistics dataset will set the stage, helping to understand the different contexts on which the different policy tools operate.

2) Policy Tool Presentations

Each speaker will present one innovative regulatory tool currently in use in their country. Presentations will focus on:

- a) Tool Design and Implementation:** A detailed description of the regulatory tool, including its goals, mechanisms, and governance structure.
- b) Impact and Challenges:** An evaluation of the tool's effectiveness in addressing the affordable housing crisis, with attention to equity and sustainability.

The tools presented may include:

*** The Netherlands: **The 40-40-20 rule, which balances social, mid-income, and market-rate housing in new developments.**

*** **Turkey:** Urban transformation projects incentivized through public-private partnerships.

*** Portugal: **Affordable rental housing programs targeting middle-and low-income households.**

*** **U.S.:** Inclusionary zoning policies and housing trust funds.

*** France: ** The ZAC (Zone d'Aménagement Concerté) model for integrated urban development and affordable housing production.

3) Discussion and Interactive Engagement

The open discussion will examine the benefits, limitations, and transferability of the described tools across governance systems. Participants will critically assess how these fragmented yet innovative approaches can address housing affordability while advancing equity and sustainability goals.

To make the session more engaging, interactive elements such as small group exercises or real-time polling may be incorporated. For example, participants might propose adaptations or new tools inspired by the cases presented and collaboratively discuss their feasibility in different governance contexts.

Keywords:

affordable housing, regulatory tools, fragmented governance, urban development, comparative analysis

Roundtable 26

RT_26 AESOP QUALITY RECOGNITION (QR) PROGRAMME: A EUROPEAN PLANNING EDUCATION PLATFORM FOR TRANSFORMATIVE REFLECTIONS, LEARNING AND ACTION / 1950

AESOP Quality Recognition (QR) Programme: A European Planning Education Platform for Transformative Reflections, Learning and Action

Authors: Tijana Dabovic¹; Juliana Martins²

¹ University of Belgrade

² University College London

Corresponding Authors: marco.picone@unipa.it, tijana.dabovic@gef.bg.ac.rs, dozugul@yahoo.com, p.a.witte@uu.nl, anna.kaczorowska@ntnu.no, evren@yildiz.edu.tr, j.martins@ucl.ac.uk, ben.clifford@ucl.ac.uk, adrianna.czarnecka@pw.edu.pl

The AESOP Quality Recognition (QR) Programme was initiated in 2006 after reflections on the needed transformations of planning programmes under changing requirements, and often challenging conditions for the planning profession and academia. After years of efforts invested by many colleagues and working groups, the Programme moved in 2015 from its Pilot Phase into the Standard Phase in 2019 following the main intention: AESOP will offer member schools its institutional support by certifying recognised qualities of fostering the European dimension in planning education programmes, as well as in nurturing a certain planning specialisation/distinctiveness within their national and regional context (Lo Piccolo, 2017; Galland and Chettiparamb, 2020).

Emerging from previous rounds of evaluations and consultations, the AESOP Excellence in Education Board (EEB) was officially established in 2017 and was assigned to develop further the QR Programme. In 2020/2021, the QR Mission, Ethos, Timeline and Criteria (AESOP QR, 2024) were defined to enable peer-to-peer sharing and mutual learning concerning the programme's curriculum identity, contents, settings and pedagogies, championing programmes' best practices, and fostering an ethic of quality enhancement amongst the programmes' staff.

The work "among peers" is two-fold: on the one hand, applicants and assessors (assigned EEB members) exchange their recognitions of the planning programme's adherence to the criteria, and on the other, assessors reflect, identify and integrate into the QR Programme qualities emerging from the previous assessments. This way we are continuously framing and sharing recognised qualities of planning education needed to prepare future professionals and scholars to address global and local multidimensional challenges and opportunities in constantly changing spaces and places.

The purpose of the Round Table is to discuss how the QR programme can guide and inspire joint reflections, learning and action needed for the planning programmes transformation in Europe and beyond, now and in the future.

Past and potential QR applicants and several EEB members/assessors, as speakers of the Round Table will discuss:

The mission and ethos of the QR programme;

How the QR Application form and Timeline guide the interactions among the programme representatives and between EEB assessors and applicants towards the recognised quality of a planning programme? How is the process seen as "transformative" from the side of the applicants? How is it seen from the side of EEB assessors?

How is sharing the QR documents, reports and articles, with the organisation of the QR events at the AESOP HoS meetings and Congresses fostering future transformations of planning programmes and how can it be developed further?

In a general sense, by revealing speakers' motivations, reflections, learning experiences and actions, we aim to open the discussion on the merits of QR to the AESOP community and to explore its existing and possible transformations as the European Platform for enhancing the quality of planning education.

Keywords:

planning education; quality enhancement; best practices; peer learning and engagement

Roundtable 27

RT.27 TRANSFORMATIONS TO POST-GROWTH –POSITIONS, PERSPECTIVES, AND PROSPECTS FOR PEOPLE AND PLANET / 1920

Transformations to post-growth –Positions, perspectives, and prospects for people and planet

Authors: Christian Lamker¹; Astrid Krisch²; Lucas Barning³

¹ *University of Groningen*

² *University of Oxford*

³ *University of Vienna*

Corresponding Authors: astrid.krisch@kellogg.ox.ac.uk, c.w.lamker@rug.nl, meike.levin-keitel@univie.ac.at, johannes.suitner@tuwien.ac.at, lucas.barning@univie.ac.at, sophie.sturup@xjtlu.edu.cn, l.bertolini@uva.nl, eva.purkarthofer@aalto.fi, thomas.hartmann@udo.edu, karlbenjamin.kraehmer@unito.it, karin.bugow@h-da.de

In the context of critical and looming change toward a post-growth society –one that aligns ecological imperatives with social equity –planning plays a pivotal role in shaping viable pathways forward. In recent years, post-growth ideas have gained significant traction within planning discourse. However, this shift raises serious questions about the suitability of existing planning paradigms, their underlying logics, and their capacity to drive systemic change. Understanding their contextual relevance and legitimacy is essential in responding to the profound challenges of an increasingly complex and rapidly changing world.

This roundtable will engage with these discussions from three consecutive perspectives:

- A key tension in planning for sustainability and transformation lies between top-down governance and bottom-up participation, in particular moving beyond studying them in isolation. A major challenge for future research is to better connect insights from local experiments with broader policy implementation. This panel will explore the trade-offs, contradictions, and potential of hybrid governance models that bridge these perspectives, offering original pathways to move beyond growth dependencies.
- Current planning paradigms reach limits and systemic barriers, highlighted by post-growth and degrowth critiques. Many of these challenges arise at the intersection of planning's deep-rooted growth orientation and the broader economic and societal frameworks that reinforce it. By interrogating these dynamics, we aim to uncover opportunities for rethinking planning approaches beyond conventional growth imperatives.
- Established roles and practices seem insufficient to meet contemporary societal and environmental challenges effectively. The panel will reflect on how post-growth planning approaches can enhance institutions, tools, instruments, and governance structures. This includes reimagining the role of planners in coordinating diverse and often conflicting demands while navigating the increasing complexity of policy landscapes and public expectations.

The roundtable invites panellists to share insights from their research and practice, examining the paradigms and theoretical foundations that shape their work. We encourage the audience to critically engage with the potential of spatial planning as a transformative force, reflecting on its capacity “to shift our thinking and adopt alternative approaches that prioritize people and the planet”(AESOP 2025, Call for Papers). Through this dialogue, we aim to explore the diverse approaches that position planning as a critical catalyst for systemic change in an era of planetary crisis.

Keywords:

Post-growth planning; transformative agency; experimentation; role of planners

This session aims to explore the process and challenges of publishing in planning research, featuring editors from planning journals, such as: *Habitat International*, *Progress in Planning*, *Journal of Planning (Planlama)* and *plaNext*. Each editor will have 10–15 minutes to share advice on publishing—highlighting their do’s and don’ts of submitting a paper—and offer their critical perspective on the future of publishing in planning academia. Key questions to be addressed include: What makes a good (international) paper? What should authors be mindful of when submitting a paper? Who should be the co-author of a paper? What is the ‘best’ journal to publish and how significant are metrics in choosing where to publish? What is the most effective way to respond to reviewers’ comments? How long should the review process take? What is the role of AI in the future of publishing?

While publishing remains a critical aspect in terms of developing as a scholar, the publishing landscape is becoming increasingly complex and confusing, especially for early career researchers. Challenges include the proliferation of journals—both legitimate and predatory—rising publication costs, delays in the review process due to the growing workload of academics and increasing levels of submissions, and contentious metrics for evaluating journal and article quality, ranging from citation counts to social media mentions. At the same time, structural inequalities persist, such as the underrepresentation of global south contexts and universities on editorial roles and in published outputs, compounded by the dominance of English as the primary language for international dissemination, which creates its own distortions in terms of knowledge construction.

Rather than avoiding such complex issues, the purpose of this roundtable session is to engage in a moderated Q&A with researchers—particularly PhD students and early-career scholars—and to facilitate a constructive discussion on this evolving landscape, while providing practical advice for navigating its challenges.

The Conversations-in-Planning YA-AESOP booklet series, an initiative of AESOP's Young Academics (YA) network, foster meaningful dialogues between scholars on theories, concepts, ideas, and practices in spatial planning. This series provides an interactive platform for YAs to develop their academic and intellectual skills through an intergenerational knowledge share. Each issue delves into the evolution of planning approaches, draw lessons from experiences practitioners, and encourages reflection on the future of the discipline.

The roundtable focuses on four key objectives:

1. Promoting the editorial project Introducing the booklet series while addressing the challenges and opportunities of this bottom-up, collaborative initiative. This project emphasizes discussion and learning through active engagement within the scientific community.
2. Discussing the cultural significance Highlighting the project's outcomes and identifying new directions, including potential contributors, relevant topics, and compelling case studies for future issues.
3. Presenting the latest booklet Showcasing In the Mirror of Urban Landscapes: Sharing Experiences and Grounding, authored by Prof. De las Rivas, Ana Ruiz Varona, and Federico Camerin.
4. Introducing the special issue "European Planning Contexts" Announcing the second special issue in the series'new format, following Planning Practices and Theories from the Global South (2021). This edition will address critical topics such as climate change, housing challenges, and feminist cities; featuring contributions from both experienced scholars and young academics.

The roundtable aims to foster open discussion by engaging contributors, participants, and the audience, enriching the dialogue on the discipline's core challenges and innovations.

Roundtable 31

RT_31 PLANNING, PUBLISHING AND THE PLANET: ACADEMIC PLANNING PUBLISHING IN TIMES OF PLANETARY CRISES / 2047

PLANNING, PUBLISHING AND THE PLANET: ACADEMIC PLANNING PUBLISHING IN TIMES OF PLANETARY CRISES

Authors: Angelique Chettiparamb¹; David Kaufmann²; Dominic Stead³; Katie McClymont⁴; Tuna Tasan-Kok⁵

² *ETH Zürich*

³ *Aalto University*

⁴ *University of the West of England Bristol*

⁵ *University of Amsterdam*

This roundtable will address the role of academic planning publishing in today's world of multiple and protracted crises. It will include perspectives from editors of leading planning journals such as Planning Theory, European Planning Studies, Planning Theory & Practice, European Journal of Spatial Development, and disP - The Planning Review.

By engaging with the Congress theme, this roundtable will discuss the role of academic planning journals in today's age of planetary crises, what these journals can and should do to approach these world of multiple interlinked crises (such as climate change, biodiversity loss, related social exclusions and socio-spatial inequalities, and ongoing wars and displacements) and whether and how they can contribute to transformative action. We will discuss whether these global crises are well represented, reflected and analysed through the lenses of planning in planning journals and what could be future approaches to make our planning journals more relevant for transformation action. We are sure that planning research has much to say about how these crises are playing out, affecting different regions of the world and different populations in different ways. We will also ask whether we have enough diverse perspectives represented in planning outlets; and how we can engage with diverse disciplines, all of which are relevant to analysing these crises and proposing transformative action, despite being already a highly interdisciplinary field.

We will also discuss important issues about the future of academic planning journals: What are new publishing formats, article types, and processes to be more innovative, inclusive and equitable? How can early career researchers and voices from practice and community organizations be better integrated? How can we better incorporate the perspectives of planning scholars from different regions of the world, and what role can AESOP and other international planning associations play in facilitating academic planning publishing?

All in all, we will ask substantive and procedural questions for how to produce and disseminate planning knowledge relevant for better understanding these planetary crises as well as formulating transformation strategies, tools and pathways for approaching these crises. After some initial reflections from various editors of planning journals, we will open the roundtable for comments and questions from the audience. Please come and ask questions that interest you!

RTPI

RTPI / 2091

WHAT ROLE SHOULD THE ROYAL TOWN PLANNING INSTITUTE AND OTHER PROFESSIONAL INSTITUTES PLAY IN SHAPING AND RESPONDING TO THE EMERGING EUROPEAN PLANNING RESEARCH AGENDA?

Corresponding Author: daniel.slade@rtpi.org.uk

The Royal Town Planning Institute (RTPI) is current developing a new Research Strategy for 2026 to 2029. Among other important functions, the Strategy will guide the Institute's significant investment in new research, shape its relationships with key partners (including planning schools around the world), and determine its approach to generating impact.

In this context, this special session, chaired by the RTPI's Head of Practice and Research and featuring representatives from other key planning-related institutions, will explore:

- Emerging Europe-wide research priorities;
- Key international research 'gaps';
- The scope for greater international collaboration between planning institutes; and
- The role professional bodies and planning institutes should play in supporting and delivering research with partners in academia.

In addition to a panel discussion, there will be the opportunity for the audience to interactively feed into the RTPI's consultation on its new strategy.

Special Session 1 | PLANNING FOR JUST ENERGY TRANSITION

SS_01 PLANNING FOR JUST ENERGY TRANSITION / 2007

Pathways to Just Energy Transitions in Post-Conflict Ukrainian Cities

Authors: Agnieszka Szumilas¹; Kasia Piskorek¹; Magdalena Belof¹; Wawrzyniec Zipser¹

¹ *Wroclaw University of Science and Technology*

Achieving just energy transition in post-conflict Ukrainian cities requires addressing multiple layers of transformation. As Ukraine moves toward EU membership, aligning its energy transition with EU climate and energy policies is essential for joining related programmes and fostering inclusive and resilient urban development (Energy Community, 2024). This transition goes beyond decarbonisation, aiming to ensure that the benefits and burdens of energy reforms are distributed equitably, preventing social exclusion and energy poverty (Bouzarovski and Simcock, 2017). More importantly, developing comprehensive strategies for post-war redevelopment is essential to ensuring a coordinated and effective reconstruction process, mitigating disruptions, and facilitating sustainable recovery (Lukash and Namoniuk, 2024).

Ukraine is currently facing numerous challenges. The course of the war and its potential outcomes, especially in light of recent geopolitical developments, have made the situation increasingly difficult. However, when focusing specifically on the energy transition, it becomes evident that addressing these challenges through targeted reforms and preparing adequate strategies can support more resilient urban development and alignment with EU standards (European Commission Joint Research Centre, 2025).

Consequently, in addition to providing an overview of the Ukrainian context, this study firstly draws on the experiences of Central and Eastern European (CEE) countries to illustrate how post-socialist states navigated urban transitions during their EU accession. It also examines the challenges they currently encounter in moving towards carbon neutrality, aligning policies with EU frameworks, and addressing regional inequalities (Dąbrowski and Piskorek, 2018). Nevertheless, it appears evident that lacking targeted policies may disrupt the transition process, leading to uneven benefits and the continuation of energy poverty (Bouzarovski and Simcock, 2017).

Therefore, to support their efforts, the EU has integrated Ukraine into several dedicated funding mechanisms and policy frameworks, including Horizon Europe, the European Green Deal, and the Energy Community Treaty (Energy Community, 2024). These initiatives promote infrastructure modernisation, renewable energy deployment, capacity building, and participatory planning. They also encourage stakeholder engagement and the development of governance frameworks to strengthen Ukraine's alignment with EU sustainability goals.

Secondly, the research examines how projects such as U_CAN (or SUN4Ukraine), through partnerships with the Cities Mission –Climate-Neutral and Smart Cities (CNSC), can facilitate Ukraine's journey towards carbon neutrality. These collaborations foster knowledge exchange, promote good practices, drive innovation, and support co-developed decarbonisation strategies tailored to the needs of war-affected urban areas. A critical element of this transition is addressing the needs and factors which significantly affect disadvantaged areas. It necessitates the development of appropriate recovery frameworks to aid post-conflict redevelopment, building on Ukrainian

potential, ensuring affordable and resilient access to clean energy, enhancing energy efficiency, and supporting community-owned renewable projects (Lukash and Namoniuk, 2024). Strengthening local governance and planning can also assist municipalities in devising tailored solutions while remaining aligned with national and EU policies (Dąbrowski and Piskorek, 2018).

Finally, the study presented in this paper discusses how spatial planning systems can navigate the challenges of integrating spatial justice into energy transition strategies amid the complexities of war-affected urban areas. It offers actionable insights for Ukrainian policymakers and planners striving to align energy transitions with EU standards with support from the Mission Cities (European Commission Joint Research Centre, 2025).

Positive Energy Districts as an Urban Project: Representation, Redistribution and Scale in Cureghem's Just Energy Transition

Author: Dieter Bruggeman¹

Co-authors: Laura Shllaku¹; Fabio Vanin¹

¹ *Vrije Universiteit Brussel*

Corresponding Authors: fabio.vanin@vub.be, dieter.bruggeman@vub.be, laura.shllaku@vub.be

In recent years, numerous energy transition projects on the scale of the neighbourhood have emerged, along with a range of concepts and programmes to stimulate, support, streamline, mainstream or assess these. Many of these initiatives intend to achieve their ambitions through a meticulously engineered combination of technical and social interventions. When confronted with real-world heterogeneous urban arrangements, their implementation often turns out more challenging or less effective than anticipated (Gohari et al., 2024; Karvonen et al., forthcoming; Rutherford and Coutard, 2014).

The PED4ALL project (JPI Urban Europe, PED Call II) has studied possible pathways for just energy transitions in Cureghem, one of the most socio-economically vulnerable and culturally diverse neighbourhoods of the Brussels Capital Region. Co-directed by local residents and organisations, a conversation on everyday energy practices was initiated. This resulted in a rich understanding of the needs, opportunities and challenges concerning renewable energy in the neighbourhood. Beyond financial and technical considerations, this conversation also emphasized the importance of social and cultural realities in shaping renewable energy transitions in Cureghem.

Building on these insights, energy transition strategies for the neighbourhood were co-developed. These strategies strike a careful balance between multiple tensions affecting the neighbourhood's energy transition: The institutional framework of energy transition programmes facing a neighbourhood characterized by fragmentation, diversity, informality and constant change; the dilemma of promoting the energy transition by putting emphasis on its financial profits for building owners or by focussing on the improvement of living conditions for residents; a focus on individual households versus the already present, but at times unconventional collective dynamics concerning energy practices and their potential for renewable energy.

Although these tensions are particularly pronounced in Cureghem, they reflect broader dynamics that are prone to be found in other urban settings. By framing energy transition as an urban project rather than solely as socio-technical infrastructure (Castán Broto and Robin, 2020), this paper offers critical insights into planning for just energy transitions. It highlights how urban processes can integrate spatial justice principles, ensuring that energy transitions address representation, redistribution, and scale in equitable and context-specific ways.

SS_01 PLANNING FOR JUST ENERGY TRANSITION / 2049

Energy Justice in Underprivileged Neighbourhoods: Reimagining Energy Transitions Through Community Storytelling

Author: Lena Verlooy¹

Co-authors: Laura Shllaku¹; Tim Devos¹

¹ Ghent University

Corresponding Authors: laura.shllaku@ugent.be, tim.devos@ugent.be, lena.verlooy@ugent.be

Achieving fair and inclusive urban energy transitions is a pressing societal challenge, particularly in the context of the ongoing climate and energy crisis. These transitions extend beyond technical upgrades or infrastructural changes; they necessitate a rethinking of social relations, governance models and economic structures. While concepts and frameworks such as Energy Communities and Positive Energy Districts (PEDs) emphasize the neighbourhood scale and integrated transformations of energy systems and living conditions, recent research highlights that energy injustices often remain under-addressed. In particular, there are fundamental challenges in addressing complex and interrelated injustices in underprivileged inner-city neighbourhoods. Residents of these neighborhoods frequently face energy injustices due to high costs and limited access to renewable energy services. Moreover, structural injustices undermine engagement for collective action and diminish community cooperation (McNamara et al., 2013), depriving inhabitants of the necessary resources and opportunities to develop their capabilities (Gaupp et al., 2023). These factors can act as barriers for collective energy transformations.

In response, energy justice has gained increasing attention in recent years, emphasizing the need for fair distribution of benefits and burdens in energy production and consumption, inclusive public participation in energy decision-making, and the recognition of diverse perspectives rooted in social, cultural, ethnic, racial, and gender differences (Feenstra & Özerol, 2021). While energy justice provides a valuable analytical framework for institutional processes and policy discourse, it predominantly emphasizes individual responsibility and rights-based approaches to justice (Damgaard et al., 2022).

Scholars and practitioners have called for more inclusive, creative, and participatory approaches to broaden voices and visions in energy futures, engaging more directly with everyday lived experiences. Recently, storytelling has been increasingly recognized as a useful tool for envisioning just energy futures, particularly in its ability to engage diverse voices such as policymakers, community members, activists, and other groups of population directly affected by energy decisions (Dahlgren et al., 2024; Moezzi et al., 2017). Storytelling offers a way to uncover experiences, practices, emotions, and meanings associated with energy, leading to a deeper appreciation of its sociotechnical nature (Staddon, 2017). It also ignites people's imagination and broadens perspectives on future possibilities (Hajer & Versteeg, 2019) and has the potential to unite people and strengthen community processes (Sol Cueva, 2025). Thus, methods focusing on narrative approaches can allow researchers to pose alternative questions, focus on neglected issues, and include marginalized perspectives.

This contribution explores the potential of storytelling and narrative mapping methods as a means to engage with everyday experiences of energy vulnerability and diverse community perspectives on energy systems and transitions. Moreover, we explore how storytelling can be deployed to bridge the gap between local needs and experiences and governmental and institutional stakeholders. Drawing on feminist theories of care and care ethics, we aim to explore how storytelling can challenge the individualistic framing of energy concerns, and can serve as a powerful tool for democratizing energy transition discourses by revealing how energy is deeply interwoven with everyday practices, emotions, and aspirations. To do so we draw on empirical work conducted in a neighbourhood in Ghent, Belgium, exploring different ways to build collective storylines based on how individuals and community organisations encounter energy in their daily lives and how they assess its role in shaping their lived experiences (Smith & High, 2017). Moreover, we reflect on the potential to increase energy literacy and foster collective action.

SS_01 PLANNING FOR JUST ENERGY TRANSITION / 1937

Sacrifice zones of the EU's just energy transition in transport – The case of Jadar - Serbian rural, biodiverse and lithium rich region

Author: Tijana Dabovic¹

¹ *University of Belgrade Faculty of Geography*

Corresponding Author: tijana.dabovic@gef.bg.ac.rs

The rise in global greenhouse gas (GHG) emissions and pollution since the 1960s is causing a global climate crisis. Some parts of the world have stepped up their efforts to transition from carbon-based to renewable energy sources in the last decade(s). While the use of renewable energy sources is increasing, GHG emissions are reaching record highs with no evidence that they have peaked. Similarly, transport is responsible for around one-sixth of global fossil fuel emissions and is experiencing exponential growth in many, but not all, parts of the world. Electric vehicles (EVs) are considered the key technology for decarbonising road transport. Their production and sales are also increasing in many, but not all, parts of the world.

The EU has a number of acts and documents guiding the EU's energy transition and the functioning of the internal market, e.g. the Critical Raw Materials Act. The EU laws defend the interests of its citizens and ensure that all potentially affected stakeholders have a say in the process (European Commission, 2023a; 2023b). In addition, the EU's Territorial Agenda 2030 calls for strengthening the territorial dimension of sectoral policies and aims to promote an inclusive and sustainable future for all places.

What are the contradictions of planning “just energy transition” in the EU?

First and foremost, no territorial entity controls its climate. Lower GHG emissions and improved environmental conditions only in the EU will not stabilise its climate. Secondly, Fressoz (2024) claims that there is no energy transition. The primary energy sources do not replace each other. Rather, they fuel each other's exploitation, along with the exploitation of raw materials, especially under the imperative of competitive, uninterrupted economic growth. While some countries are deploying more EVs and managing to reduce GHG emissions, the production of EVs pollutes areas where the needed raw materials are extracted. Moreover, the EU considers justice for stakeholders only within its borders.

Where are these contradictions manifested?

The protracted EU integration process has turned the Western Balkans countries into EU candidates but also stabilitocracies. Stabilitocracy in Serbia means that the country is ruled by a (semi-)authoritarian regime supported by the EU. The regime can ensure

a certain degree of regional stability and fulfil the interests of powerful foreign governments while deteriorating internal democracy and increasing its wealth. Lithium, which is (currently) the main material in EV batteries, is on the EU “critical raw material” list, and while its presence has been identified in several EU countries (most notably Germany), the Serbian agricultural and biodiverse region, Jadar has been chosen by the company Rio Tinto for its exploitation. At that moment, Jadar became a “sacrifice zone” of the EU “just energy transition”. Moreover, spatial planning for lithium mining has since been an instrument to legitimise the ruling party’s narrative of unimaginable national economic growth, for Rio Tinto’s interest to profit from lithium exploitation, the interest of the German “green” EV industry to get cheap lithium while restricting its access to the Chinese EV industry, and the interest of EU citizens to feel climate-friendly while driving EU-made EVs.

In Serbia, this “sacrifice” and the proven negative effects of lithium mining have provoked the resistance of the local stakeholders, who are supported by the majority of the people in Serbia. Questions for this occasion are: If the EU continues to plan its “just energy transition” under these conditions, are citizens and planners from the EU agreeing to permanently ruin the environment and wellbeing of people outside the EU? Are the borders of the EU states the true boundaries of its citizens’ and planners’ dignity and sense of spatial justice?

SS_01 PLANNING FOR JUST ENERGY TRANSITION / 2026

Planning for A Just Urban Energy Transition: A Phronetic Approach

Author: Enza Lissandrello¹

¹ Aalborg University

Corresponding Author: enza@plan.aau.dk

The energy transition has become a crucial issue in recent years, particularly regarding urban sustainability. However, current academic and practical discussions often emphasise management perspectives and technical expertise within a political context shaped

by historical and contemporary practices. This paper explores a planning perspective essential for a just urban energy transition, focusing on deliberative planning processes, the evolution of values, and the practical judgment informed by the reflections of planning professionals.

The objective is to develop a planning perspective largely overlooked in discussions about a just urban energy transition. This lack of focus has resulted in various un-addressed challenges, particularly regarding the dynamic interaction between the socio-spatial development of urban environments and the energy transition. This interaction involves critical issues such as energy efficiency, flexibility, and production. The connection between urban and energy sectors is becoming increasingly important for planning future urban energy transitions. Although there have been advancements in both areas, adopting a planning perspective can enhance our understanding of how energy transitions can be stimulated through urban processes, practices, and transformations.

A significant question from this planning perspective is how we can move beyond the simplistic dichotomy of fossil fuels versus renewable energy and the distinction between clean and dirty urban energy transitions. There is a pressing need to develop new methodologies that address the complexities of urban processes. Patsy Healey's concept that futures are 'path contingent' rather than strictly 'path dependent' emphasises the importance of examining specific experiences and their relevance in various contexts rather than adhering only to generalised universal principles.

Through three contemporary Danish case studies, this research analyses reflective practices related to urban energy transition processes. The case studies involve co-creation processes in renewable energy planning, planning for energy communities, and developing positive-energy districts at the neighbourhood level in three diverse Danish contexts. Being often quoted for its advanced progression in the energy transition, the Danish cases offer valuable examples on how national frames and expert knowledge work in the urban context uncovering emerging power dynamics, conflicts, and resistances. By examining metaphors, learning processes, and necessary adjustments to planning routines, the research focuses on how reflection significantly influence how planning professionals develop narratives for just urban energy transitions while also considering urban transformation processes and the importance of public participation. Exploring ongoing projects and processes of urban energy transitions critical aspects emerge in relation to enhancing social sustainability and social justice. These considerations raise essential issues for urban energy transition processes and the power dynamics that affect democratic urban energy planning practices. The presentation concludes by advocating for a renewed interest in a 'phronetic' planning approach to encourage and incorporate practical wisdom into practitioners' work to foster the critical reflexivity needed for urban energy transition planning processes while also addressing the ethical implications related to social justice issues. Key considerations include existing governance structures, regulatory frameworks, stakeholder engagement, and strategic negotiations. The findings from this analysis enhance urban energy transition strategies by bridging critical insights from planning theory and practice into existing STS and transition management approaches.

SS_01 PLANNING FOR JUST ENERGY TRANSITION / 2050

Urban Regeneration-Energy Transition Nexus. Challenges from Multidimensional and Place-Based Approaches to Energy Justice

Author: Laura Grassini¹

¹ *Politecnico di Bari, DICATECh*

Urban strategies for energy transitions have been largely driven by the decarbonisation imperative in response to global concerns for climate change. Mainstream research, with its emphasis on the development potential of renewables, energy balances, energy efficiency and financial models, as well as international policies supporting the replication potential of specific transition components (see e.g. the EU Renovation Wave for energy efficiency at building level), both emphasise a technocratic and market-driven approach. However, this framing tends to oversimplify the intricacies of urban dynamics and the significance of social, institutional and cultural factors interwoven with technological and market dimensions of energy transition.

A growing body of research has begun to shed light on the dark sides of the diffusion of low-carbon innovations (Ertelt and Carlborg, 2024). Several contributions have emerged, highlighting energy injustices associated with the prevailing energy transition paradigm while advocating for a human-centred approach (Jenkins et al., 2018). The concept of energy justice, with its multidimensional and intersectional features, has emerged as a theoretical, methodological, and empirical tool to both highlight these concerns and suggest new conceptual frameworks to support energy transition (Walker and Day, 2012; Amorim-Maia et al., 2022).

These issues are beginning to resonate in the planning debate, with questions being raised about how planning can contribute to the energy transition while fostering transformative changes and equity (Scott, 2022). Whilst the relationship between spatial and energy planning at the city scale has been criticised for the adoption of a top-down and normative approach, the neighbourhood context is increasingly recognised as a promising scale for transition, although this is still largely interpreted from a functionalist perspective (De Pascali and Bagaini, 2019).

The present paper focuses on integrated urban regeneration initiatives in disadvantaged neighbourhoods with the aim to highlight their contribution for a just energy transition. The transformative potential of these initiatives for achieving just transitions can be attributed to several factors: their place-based focus and the search for context-specific and integrated solutions; the attention paid to collective practices and place-making dynamics, which can reveal new solution spaces; the promotion of situated learning of energy practices, which serves to overcome a simplistic analysis of energy demands and needs; and the understanding of multiple drivers of energy vulnerabilities, which supports the possibility of operationalising the multifaceted features of energy justice.

The analysis is carried out through a combination of theoretical investigation and multiple case studies, and contemplates the prospect of suggesting a transformative agenda to strengthen the urban regeneration-energy transition nexus from the perspective of energy justice.

SS_01 PLANNING FOR JUST ENERGY TRANSITION / 2048

Fostering Local Inclusive Energy Transitions Through Innovation Communities

Author: Pia Laborgne¹

Co-author: Volker Stelzer

¹ KIT

Corresponding Authors: volker.stelzer@kit.edu, pia.laborgne@kit.edu

Innovation Communities (ICs) provide a dynamic framework for embedding the energy transition in society, fostering broader engagement and accelerating progress towards climate goals. These communities empower participants by cultivating a sense of collective efficacy, trust in collaboration and community, and by creating networks and activating different resources (knowledge, know-how, infrastructure, financial resources...). Building an innovation community for climate action is not only about technological progress, but also about cultivating a sense of agency among participants. Through shared experiences of transformation, individuals and organisations become more aware of their ability to contribute to sustainability goals. The participatory nature of such a community ensures that solutions emerge from a wide range of perspectives, fostering trust and long-term commitment. In addition, an IC supports the well-being of its members by creating an environment where collaboration leads to tangible change, reinforcing the idea that democratic processes can drive effective climate action. A key challenge is to strike a balance between providing support structures and encouraging individual responsibility and creativity. Addressing this balance is essential to unleashing the full potential of innovation communities in advancing inclusive and sustainable energy transitions.

This presentation is based on the project “Strengthening and Consolidation of Innovation Communities to Implement the Recommendations of the Climate Citizens’ Council of the Freiburg Region”. (Innovation Campus Sustainability ICN) The project facilitates and accompanies cooperation between civil society, science, politics and business to promote an inclusive energy transition. The initiative came from civil society within the framework of the Climate Citizens’ Council of the Freiburg Region:

- How can the energy transition be made more inclusive and actively shaped by a broader segment of society?
- What can innovation communities contribute to the implementation of a sustainable energy transition?
- How can these communities enhance the social sustainability of cities in terms of democracy, community and participation?

As part of a Seed Money project, the primary research focus is on exploratory process

analysis. This includes

- Identifying potential opportunities and barriers in the development of an IC.
- Analysing key factors that influence the effectiveness of the community in achieving climate goals.
- Examining the self-efficacy and well-being of participants, particularly in the context of the energy transition.

By systematically exploring these issues, the project aims to provide a basis for future large-scale IC initiatives that integrate climate action with democratic transformation.

The presentation will introduce the idea and background of Innovation Communities, the project design and the main results of the accompanying scientific research.

SS_02 DISCUSSING SPATIAL JUSTICE FROM/TOWARDS A SOCIO-ECOLOGICAL PERSPECTIVE / 1916

The case of the Old Town of Taranto and its post-disaster possible futures

Author: Gabriele Leo¹

¹ IUAV

The paper proposal focuses on the peculiar case of Taranto's Old Town which today finds itself in extremely precarious conditions in terms of both spatial and social infrastructures.

The city of Taranto (Apulia, Southern Italy) is paying the consequences of a massive process of industrialization (Italian Institute for Industrial Re-construction). Its territory is undergoing one of the deepest environmental crises of Southern Europe as it is affected by severe pollution, environmental degradation and a growing public health crisis. In 2022, Taranto's territory was included in the UN's world list of "sacrifice zones".

Throughout the 20th century - as a consequence of the industrial turn - the Old Town underwent an impressive diaspora: a large number of new social housing complexes were built in the outskirts of the city and, through an intervention of so-called "sanitation", most of the inhabitants were forced to move. It gradually became a stigmatised place as it was perceived as dangerous and unsafe. The number of inhabitants decreased from 25 thousand (19th century), to less than 3 thousands.

One of the most drastic effects of the depopulation is the collapse of abandoned buildings. At the beginning of the 21st century, almost 80% of the buildings in the Old Town were no longer able to accommodate life. Entire areas are now enclosed and inaccessible and, due to the physical ruination and persistent lack of care, local communities are fragmented and fragile.

The paper could unfold in two parts:

- Part 1 aims to provide a cognitive framework of the situation including, first, an analysis of the context and processes that have led to a condition of structural crisis, and second, regeneration policies implemented by local and regional administrations.
- Part 2 takes into consideration specific cases of civic activation that, through cultural production programmes, pursue an agenda aimed at promoting a process of collective emancipation by building a renewed imagery of the city as a laboratory for urgent urban topics.

The words and operational tools of transition. On territorial systems

Author: Teresa Gargiulo¹

Co-authors: Enrico Formato ¹; Nicola Fierro ¹; Angela D'Agostino ¹; Maria Cerreta ¹

¹ *Università degli studi di Napoli Federico II*

Corresponding Authors: e.formato@unina.it, nicola.fierro@unina.it, angdagos@unina.it, teresa.gargiulo@unina.it, cerreta@unina.it

This contribution proposes a critical analysis of the acronyms and operational tools that describe the package of measures, actions and projects implemented with the resources allocated by the National Recovery and Resilience Plan (PNRR), the instrument through which the 'Next Generation EU' European plan (the programme with which Europe responded to the pandemic crisis) was territorialised in Italy. The purpose of this analysis is to investigate the relationship between public policies and the operational tools they make use of, in order to reflect on the effects they produce on the territories, through textual analysis - the explicitness of words, their recurrence (or not) in institutional documents, the possible ambivalent meanings they take on - and the parallel spatial mapping of inertia and territorial transformations.

In particular, we examine a wide-ranging research programme, financed with PNRR funds, which involves, in an 'extended partnership', several universities, research centres and companies: the network called 'GRINS', an acronym for Growing Resilient, Inclusive and Sustainable. This case study allows us a privileged point of view, since each of the authors of this contribution is involved with a different role within this research network. The deconstruction and critical analysis work looks at the PE9 partnership within the broader system of European funding allocated through the Next Generation EU (NGEU), also known as the European Green Deal. The pact was endorsed by the European Commission in 2019, when member states committed themselves to a process of converting their once prosperous and linear growth into a sustainable and virtuous development process. On the contrary, in the PNRR, approved after the pandemic emergency, the words recovery and resilience refer to the capacity of a system to resist, adapt and recover its form after traumatic events, denouncing the state of crisis and the need to cope with the effects generated by the pandemic on economies and territories.

An analysis of the acronyms and words most frequently used in the two documents reveals a shift in the focus of the issue: climate, ecology, the environment and the green transition, central in the former, assume marginal importance in the latter, which highlights the need for reforms and territorial investments instrumental to recovery.

As in the use of the term territory, which in its adjectival derivation is reduced to a background presence, so in the GRINS proposal for the implementation of a database, to which the description of the territory is entrusted, space is represented through an abstraction. This contribution, reflecting the research approach of the DiARC unit within the GRINS project, highlights the need to integrate this perspective by restituting the material system, woven with tangible and intangible relationships. This system is not merely a locus of sovereign authority for implementing the actions outlined in the Plan. The absence or disappearance of the terms Landscape and Ecosystem, that is, precisely those devices constituted by the relations themselves and in which rights and interests intersect, denounces the reversal of priorities and ambitions of the Plan and its implementation tools.

The problem therefore arises of restoring the complexity of territorial systems, dynamic configurations of relationships in which flows, interactions and interdependencies intertwine, within data-informed processes.

This investigation into the vocabulary of premises and the use of tools aims to bring to attention the territorial specificities and the otherwise unexpressed needs of the plurality of instances involved in transformation processes that produce significant effects on the socio-ecological cohesion of territories.

Public spaces in Rome: expanding the potential by reinterpreting old rules in a new framework

Author: Mauro Baioni¹

¹ *Università degli studi Roma Tre*

Corresponding Author: mauro.baioni@uniroma3.it

Fifteen years after the approval of Rome's Master Plan, less than half of the designated green and public service areas are accessible. This is due to delays in land acquisition, management issues, the presence of incompatible uses, and the divestment of originally planned facilities. As a result, only one-third of urban areas meet the legally mandated provision of 18 m² of public space per inhabitant.

To address these long-standing issues, the Capitoline Administration has launched a dedicated program and enlisted university support for both its strategic framework and the development of operational tools.

Although designed for operational needs, the program has been conceived as a laboratory.

New territorial figures (Roma città-territorio e Roma 300 quartieri) illustrate how socio-ecological factors and proximity infrastructure can redefine the relationship between spatial justice principles, the vision of the city, and the layout of public spaces at the local level. A new monitoring and evaluation tool translates this new framework into project assessment and approval procedures.

After briefly outlining the current situation, aims, and contents of the program, the paper reflects on how the implemented mechanism can trigger new ways of thinking, mobilize social resources, and exploit the unique potential of Rome.

Pathways towards and interpretations of shared governance. Comparative notes on Brussels, Naples and Barcelona.

Author: Verena Lenna¹

¹ *VUB*

Corresponding Author: verena.lenna@vub.be

Focusing on Brussels, the research project WELCOMIN* aims to explore long-lasting forms of shared governance and ownership to overcome the fragile conditions of many civic initiatives legally framed as temporary occupations. The working hypothesis at the core of this project is that many of these, maintained by the communities for the communities, interweaving care practices for the human and the non-human, represent a welfare infrastructure towards what I define as ecological welfare, the word "ecological" being meant in the sense of the deep ecology (Naess, 1973).

During the first year of the research project, the hypothesis of shared governance has been applied to a few highly contested sites, whose future is debated between the opportunity of spontaneous regeneration of nature and wilderness on the one hand; and the need to address crucial issues such as developing strategic infrastructures or tackling

the housing question on the other hand (Lenna 2024). A prospective, scenario-based approach using research-by-design to explore the potentials of shared governance has been combined with a comparative framework. The purpose of such a hybrid methodology is to support and complete the visionary component of the scenario approach with the pragmatic knowledge and the hands-on expertise of actors from other European cities well known in the literature and amongst practitioners for their innovative experiments of shared governance (Lenna 2025).

The paper aims to illustrate these research results, learning from the cities of Naples and Barcelona to identify both supportive and less favourable conditions for shared governance in Brussels while pointing out site-specific and political variations on the theme.

*WELCOMIN is the acronym for “Community Welfare Mixed Infrastructures. Reclaiming vacancy, federating capacities and empowering communities towards an ecological welfare”, a project funded by the Brussels Capital Region research funding entity Innoviris, in the framework of the Prospective research programme.

Nurturing More-than-human Relations in Contested Urban Spaces: Learning from Parco Terranostra

Author: Ludovica Battista¹

Co-author: Enrico Formato²

¹ *Università degli studi di Napoli Federico II - Dipartimento di Architettura*

² *Università degli Studi di Napoli “Federico II”, DiARC - Dipartimento di Architettura*

Corresponding Authors: e.formato@unina.it, ludovica.battista@unina.it

In Naples’ periurban fringe, the case of Parco Terranostra in via Boccaccio challenges conventional urban planning approaches by revealing how spaces beyond institutional control can become laboratories for socio-ecological justice. At the heart of this experience lies a three-hectare former aviation fuel depot that became an unexpected laboratory for alternative forms of urban space. In 2015, the Terranostra collective declared the abandoned site a “self-managed liberated green area,” initiating an experiment in ecological co-existence. Through years of mutual interaction and repair, new relationships emerged between human and more-than-human inhabitants, creating a spontaneous and vibrant ecosystem where multiple species participated in the space’s transformation. However, when the Municipality of Casoria included the site in its EU regional funds proposal, these existing relationships faced erasure. Through persistent dialogue initiated by the collective and supported by the Department of Architecture of the University of Naples Federico II and the Urban Permanent Observatory on the Commons of Naples, a new “Regulation for the care and regeneration of urban common

goods" was approved, recognizing both human and more-than-human communities as legitimate stakeholders through "civic and collective use". Yet, despite this achievement, the community of Terranostra ("our land") is presently "Senza Terra"("landless"), as the site is still fenced off even after the completion of works, leaving its potential as a laboratory for multispecies governance unrealized.

The Parco Terranostra-Boccaccio experience points us toward a radical reimagining of public space through the lens of more-than-human commoning. While authorities weaponize contamination and security concerns to justify the erasure of existing socio-ecological relationships, treating these spaces as technical problems to be solved through standardized interventions, these spaces are not problems to be resolved but active places where socio-ecological conflicts are continuously negotiated and reworked. Rather than seeking conflict elimination, urban space should embrace and foster productive tension between different forms of life, recognizing daily practices of care and emotional connections as legitimate forms of stewardship. This situation challenges us to consider socio-ecological justice as a framework for recognizing the voice and the political agency of more-than-human actors in urban space-making, pushing us beyond anthropocentric models toward generative governance and design systems that can respond to emerging forms of ecological relationships.

Discussing spatial justice at the intersection between migration and housing. The inclusion system in the inner regions of southern Italy

Author: Marina Volpe¹

¹ *Università Federico II Napoli*

Corresponding Author: marina.volpe@unina.it

The interaction between migration, access to housing, and depopulation provides a significant perspective on how Italian territories adapt to global dynamics and the role of public reception policies in addressing social urban inequalities. This paper proposes the case study of INTRA, a social cooperative located in Avellino, Campania, to examine the connection between Italian migrant integration policies and informal practices of access to houses. Focusing on the recognition of fundamental rights -enshrined in international legal frameworks and endorsed by nation-states- and proceeding through the lens of migration and housing, we recognise housing as a necessary tool to access the right to the city and thus to achieve minimum conditions of spatial and social justice. The analysis inquires a SAI project (Sistema di Accoglienza e Integrazione) in a network of small towns in the Campania region -partly- affected by the National Strategy of Inner Areas. Examining social inclusion policies in vulnerable areas, such as Avellino, illustrates the crucial role of local communities in implementing these policies by triggering bureaucratic barriers delaying the recognition of migrants' spatial and social rights. At the stage of finding housing - as well as employment - the strategic role of mobilising personal skills and local networks within resident communities becomes evident, as these systems facilitate the integration of new inhabitants muddling through a complex formal inclusion system.

The informal practices of the proposed case study appear both as potential alliances between subjects with differential distribution of precarity and as a measure of the opportunities created by public policies. These alliances are built on the recognition of shared and contrasting vulnerabilities among subjectivities bringing different approaches and methodologies. Migration and housing access, therefore, are not only interconnected

issues but also privileged arenas for observing and fostering practices of resistance and solidarity.

Unveiling spatial interdependencies between inland areas and urban poles for enhanced regional cohesion strategies

Author: Matteo Giacomelli¹

Co-authors: María R. Felipe-Lucia ; Massimo Sargolini ²

¹ *POLIMI*

² *UNICAM*

Corresponding Authors: massimo.sargolini@unicam.it, mariafl@ipe.csic.es, matteo.giacomelli@polimi.it

A key challenge for territorial cohesion is to cope with the increasing marginalization and inequalities brought by urbanization. The “inland areas” discourse is today fostered by academic literature and policies to describe areas remote from the delivering of services such as health, education, and mobility while overcoming the connotation of “rural” in dichotomy with urban centres. These areas are undergoing a process of economic decline and depopulation, while not being recognized for their crucial role in terms of the multiple ecosystem services (ES) they provide to society. Such neglect is often due to current territorial policies, which prioritize investments based on economic benefits but fail to consider the ecological functions characterizing these areas. To overcome this gap, our work applies the lens of landscapes as social-ecological systems to analyse territorial dependencies between inland areas and urban poles, combining 9 socio-economic indicators for territorial characterization with patterns of supply and demand for 12 ES in Le Marche region, Italy. First, we identified 5 bundles of ES supply and demand, which were best characterized through land use and social indicators. Second, the ES budgeting highlighted how the outermost inland areas are the main providers of regulating and cultural ES; while the urban poles on the coast are the main consumers of provisioning services. Our results revealed the interdependencies along the coastal-mountain gradient, highlighting how the urban-rural dichotomy which characterizes environmental analysis often disregards the socio-cultural heritage of the inland areas and ignores the polycentric condition of rural territories. These results allow to unveil potential environmental equity conflicts. We suggest that cohesion policies should embed a place-based approach integrating local environmental characteristics to the socio-economic perspective.

Energy Transitions as Socio-Ecological Urban Projects: Representation, Redistribution, and Scale in Cureghem's PED Strategies

Author: Fabio Vanin¹

Co-authors: Dieter Bruggeman¹; Laura Shllaku¹

¹ *Vrije Universiteit Brussel*

Corresponding Authors: fabio.vanin@vub.be, dieter.bruggeman@vub.be, laura.shllaku@vub.be

In the face of interlinked socio-ecological challenges, energy transitions are increasingly framed not merely as technical undertakings but as urban projects that reshape spatial, social, and political relations. This paper examines the case of Cureghem, one of the most socio-economically vulnerable and culturally diverse neighborhoods in the Brussels Capital Region, through the lens of spatial justice. Drawing on findings from the PED4ALL project (JPI Urban Europe, PED Call II), it critically engages with the governance, design, and implementation of Positive Energy Districts (PEDs), highlighting their role in redistributive and participatory energy transitions.

Through a co-directed engagement process with local residents and organizations, this research unpacks the interplay between socio-technical interventions and the lived realities of Cureghem's inhabitants. It identifies key tensions that shape energy transitions in fragile urban environments: 1) navigating institutional frameworks that often fail to accommodate fragmented, informal, and rapidly changing urban fabrics; 2) balancing economic incentives with broader socio-ecological imperatives, particularly regarding the uneven distribution of benefits among different community groups; and 3) reconciling individual household energy needs with pre-existing, yet often overlooked, collective dynamics of energy practices.

By framing PEDs as urban projects embedded in complex socio-ecological assemblages, this paper argues that energy transitions must move beyond technocratic solutions to embrace more inclusive, multi-scalar, and justice-oriented approaches. The Cureghem case offers broader insights into how spatial planning and policy-making can support just energy transitions that foreground participation, redistribution, and ecological sustainability in marginalized urban territories.

A Community Out of the Box: Understanding Flexibility and Justice through Self-organised Housing in the Netherlands

Author: Renzo Sgolacchia^{None}

Corresponding Author: renzsgolacchia@hotmail.com

Introduction

The concept of flexibility, generally associated with the customisation of dwellings, has shifted to a more restrictive meaning, particularly in the context of housing emergencies. Temporary, mobile, modular, containerised, and prefab have become synonyms with flexible. In the Netherlands, flexwoningen (flexible housing) are primarily designed to accommodate migrant workers and are often characterised by containerised and temporary nature. These housing solutions, driven by efficiency criteria, allow employment agencies to exert control over workers' lives, regulating behaviour through inspections and warnings, while organizing shifts and transportation via algorithms. These practices reveal the oppressive nature of workers' housing, where hyper-rationalised layouts amplify workers' stress. The study examines the Roma community at De Witte Plas campsite, North Brabant, as an emblematic case of self-designed housing, which subverts corporate planning models in the Rotterdam-Venlo logistics corridor.

Sustained Thesis

The thesis explores the Roma community's practices within broader theoretical debates on flexible housing and spatial justice emphasising their relevance to reimagine contemporary urban forms. Through practices such as self-planning, recycling and sourcing building materials, and negotiating labour conditions, the community challenges rigid models of workers' housing imposed by employment agencies. By actively reshaping the logistical systems that govern their lives, the community embodies Adrian Forty's concept of 'flexibility as a political tactic,' where architectural flexibility becomes a means of resisting the capitalist control of space, enabling emancipatory forms of living. Rejecting the compartmentalisation of life into rigid functions typical of flexwoningen designed to optimise profit and control labour, the community's approach shows how workers' housing can be reconfigured into adaptable, circular, ecological, and participatory frameworks that serve the inhabitants' needs.

A key theme of this study is reconfiguration. The Roma community's practices illustrate how logistical systems, designed to optimise profit and control labour, can be repurposed to serve the needs of marginalised groups. By subverting the conventional use of online platforms and supply chains, the Roma community transforms tools of corporate logistics into mechanisms of empowerment and sustainable development. The study also identifies the Roma community's methods as an embodiment of spontaneous order, a concept developed by Edwin Buitelaar. This contrasts sharply with the designed order typical in urban planning. Rather than adhering to strict, top-down regulations, spontaneous order relies on minimal and generic building rules, enabling the evolution of community spaces.

Methodology

The adopted method adopts a combination of field research and design-driven research. Data were collected through spatial analysis and field research, as well as a series of qualitative interviews at De Witte Plas campsite with the inhabitants, and with the Barka Foundation, an organisation supporting migrants experiencing homelessness, and FairWork, an NGO committed to aiding individuals facing exploitation. Additionally, a 12-minute documentary, filmed at the campsite in both formal and informal settings, provides a brief impression of community life.

Outcomes and Conclusions

This case study contributes to the debate on spatial justice, suggesting that the Roma community's approach provides a tangible example of how marginalised groups can assert control over their living conditions. It challenges the prevailing norms of spatial organisation in the logistics corridor, illustrating an alternative paradigm where community needs and environmental considerations dictate the use of space and resources. The findings demonstrate the Roma community's ability to negotiate autonomy within the constraints of global logistics and racialized labour systems. Their housing practices, rooted in circular economy principles and participatory design, show how self-organised housing can create adaptive, fair, and resilient environments. This case suggests urban planning frameworks that prioritise community agency, flexibility, and ecology, offering a redefinition of justice and equity in spatial arrangements.

The contribution refers to the PRIN “Italia di Mezzo” and proposes the exploration of the Sacco Valley as an emblematic synthesis of the tensions between social and ecological dimensions that characterize the territories of Italy in-between metropolises and inner areas. In a territory marked by a century structured over time around various sectors, the river stands as a structuring axis and a witness to global and local transformations. The infrastructures of the Valley - such as the canal systems, the industrial development policies, the road network that fragments territories and local cultures - materialize forms of exclusion and privilege, revealing the intrinsic asymmetries in the development processes. These infrastructures, although often perceived as abstract entities functional to the connection of flows, possess a materiality and symbolic weight that anchor them deeply to the territory. They are devices that amplify inequalities. Divested of its vital function and reduced to a “stream of unconsciousness,” the Sacco River is reduced to a symbol and vector of pollution, otherwise forgotten and excluded from everyday life. It becomes a point of the intersection between environmental and socio-economic marginality: an impoverished actor of an unsustainable development model, the offspring of extractive logics and industrial reconversion. The Valley, a significant part of which is within the boundaries of an area identified by the national government as being of significant environmental concern, requiring special environmental remediation and restoration measures, tells now a history of new extractive trends that are being distributed in the seemingly empty space left by the broken promise of growth. The Sacco Valley becomes a laboratory to investigate socio-ecological justice, where the frictions between promises of industrial well-being and the disillusion of that development model converge: how to rethink infrastructures for a vision that considers the right to space for all forms of life? What territorial configurations can foster alternative and emancipatory coexistences? How can policies and projects address inequalities, not only material, but also symbolic and cultural? The relational value of infrastructures and the plurality of subjectivities that inhabit the territory (human and more-than-human communities) require renegotiating the territorialization of transition also as a process in which it is necessary to clarify and reposition rights, avoiding forms of compensation that perpetuate unequal access to collective resources.

Civic peri-urban: repositioning peri-urban urbanization in new forms of inter-generational co-ownership

Author: Nicola Fierro¹

Co-author: Enrico Formato¹

¹ *Università degli Studi di Napoli “Federico II”*

Corresponding Authors: nicola.fierro@unina.it, e.formato@unina.it

Peri-urban territories are complex socio-spatial configurations that challenge the dichotomous theoretical categories of urban and rural inherited from urban theory. They represent the local-scale outcome of spatial restructuring processes that organically intertwine decentralization, deconcentration, and territorial dispersion. These phenomena are observable both in the distribution of functions, built densities, and population, as well as in the extractive processes that subordinate these spaces to infrastructures serving urban performance. This dynamic results in a space devoid of long-term co-evolutionary processes (landscape), where specificities have been dissolved within a few decades, and the ecological context has become an instrument of the provisional present.

The intricate geography of peri-urban areas is symptomatic of multipolar organization,

where residual spaces are simultaneously a frontier to be shielded from further urbanization and a porous “ecotone” open to new forms of use and sociality.

The closure of the peri-urban realm to urban externalization and extractive phenomena necessitates a process aimed at redistributing rights through a negotiated space where urbanity acknowledges an ecological context beyond the immediacy of present needs. This process, co-created with local communities, seeks to overcome hierarchical and anthropocentric conceptions of justice, fostering intergenerational co-ownership founded on socio-ecological relationships. Such principles resonate with Article 9 of the Italian Constitution, which links environmental protection, biodiversity, and ecosystems with the rights of future generations. This shift requires rethinking the individualistic conception of space, the anthropogenic pressures, and the fragmentation of ecosystems. It calls for the recognition of collective rights based on shared practices and «living uses», which transcend the dualism between city and nature, as well as the perceived separation of society and the environment.

The concept of civic uses offers a valuable reference point, as it shares, in its original configuration, a functional character with the peri-urban fringe, often viewed as a space of performance. Contemporary legislation reframes this functional aspect by emphasizing ecological and environmental protection, thereby embedding intergenerational co-ownership within values of territorial inclusivity (Mangone, 2022).

Such closure, paradoxically, opens up the regenerative potential of peri-urban spaces, envisioning eco-public networks at a metropolitan scale as incubators for new urban civic spaces (Formato, 2021) and spatial assemblages capable of recovering «living uses» (Capone, 2016: 621). Reconstructing a public framework of civic and collective rights, practices, and spaces establishes a connection between landscape protection (e.g., Constitutional Court ruling 310/2006) and democratic participation in decision-making. This reflects a collective capital linking land ownership to the community (Di Genio, 2019: 127-140) and liberates peri-urban landscapes from any further stable development or exploitation.

This process of “re-landscaping” reimagines spaces where quantitative consumption has already occurred, reassembling what remains into qualitative relationships through spatial practices. These practices oppose the «speculative supremacy of the conceived» and ensure that the «technical activation» (Capone, 2020: 34) of regulatory frameworks does not flatten space into a mere commodity or consumable asset.

MOTILITY as a lens to challenge the urban metabolism research agenda. Towards more just and sustainable cities

Authors: Anna Attademo¹; Gilda Berruti¹; Katia Fabbri¹; Orfina Fatigato¹

¹ *Department of Architecture, University of Naples*

Corresponding Authors: anna.attademo@unina.it, gilda.berruti@unina.it, orfina.fatigato@unina.it, kattia.fabbricatti@unina.it

Motility is a biological term, referring to the capability of organisms to move independently. The research "MOTILITY - Metabolism Of inTersectionaLITY" starts from this metaphor, to investigate mainstream discourses on Urban Metabolism (UM), Sustainable Development (SD) and Circular Economy (CE), recently criticized for being focused on technological issues, neglecting spatial and social justice, and thereby not considering the need for social and systemic changes (Agyeman, 2005; Korhonen et al., 2018). To adopt a Territorial Metabolism perspective, there is the need to integrate various components: human, industrial, urban, political, landscape (Grulois et al., 2018). Building on past research on urban political ecology, the research works from an intersectional perspective looking at the management of spatial resources and intersecting social abilities of minority groups in sample communities in East Naples.

MOTILITY focuses on the city role on social interaction among people developing their own identity and orientation, conceiving sexuality and gender as multiscalar axes for developing and expressing meaning and power in public spaces (Wright, 2010). To this end, it revisits research within the diverse fields of queer and feminist theories, studying a variety of social experiences of places, identity and power across the space (Forsyth, 2001), challenging the traditional discourse on CE and related practices.

The objective is to include minorities in envisioning new purposes for metabolic flows, raising awareness as the base to promote local transitions. By fostering citizen engagement in co-designing CE micro-actions, the research aims to bridge the gap between social, behavioral aspects and the ecological transition, advancing a socially just ecological transition.

To support an experimental phase of mapping, the project will develop a community-based online mapping platform for digitally archiving experiences of care and use of metabolic resources and flows in the built environment, to build collective learning and awareness from past experiences/acquired competences and strengthen the potential relationships with forms of co-production of sustainable and inclusive space with the institutions.

The project started in January 2025, posing three questions, on which the research team is currently working through a literature review/mapping of the national and international debates, actors, main categories of research and critical points:

- Which are the main forms of marginalization in the access to metabolic resources (water, air, soil, etc.) for people out of heteronormativity?
- How do intersectional categories of minorities respond to socio-ecological issues, using metabolic resources and spaces (privately/collectively)?
- To which extent could these collective experiences of care and use feed Niches of Innovation (ref. Transition Studies) and make significant progress in terms of regulations, institutional level, experimental governance?

In compliance with the 2030 Agenda for SD (UNDP, 2015), the paper will explore spatial and social justice aspects, which can contribute to increasing the engagement of non-conformist groups (Fernandez & Maione 2017), disregarded by targeted policies of CE, as subversive of the mainstream approach on resource management and related spatial assets.

Water justice, scarcity and environmental flows. The case of Marseille

Author: Nicola Russolo¹

¹ *Università Iuav di Venezia & IUSS Pavia*

Corresponding Author: nrussolo@iuav.it

Marseille is situated in a dry region lacking water courses and groundwater reservoirs. Despite such scarcity, the city benefits of an abundant freshwater supply of the best quality. The Canal del Marseille is the 1800s infrastructure that allows this by extracting water from the Durance river -an artificial system replicated at a bigger scale and integrated by the Canal EDF, the Canal de Provence, and several storage basins.

The territorial hydraulic network is efficient and mostly composed of pressurized underground pipes which minimize leaks: it draws water from the river ecosystem and bypasses the surrounding landscapes for the benefit of anthropic consumption. Together with energy production, the system uses 80% of the Durance's flow. While the distribution principles don't normally cause conflicts between human consumers, the river doesn't have a legal personality, lacking representation for its environmental flows needs -on which many ecosystems in a vast territory depend, like the étang de Berre wetland, endangered by the Canal EDF's outlet, and the Rhone delta area.

The extractivist water 'cycle' of Marseille -where only 12% of the ground isn't sealed and floods regularly saturate the drainage networks -ends into the sea, sometimes without treatment. Yet the presence of two water streams within the urban area can be an occasion for rethinking the city-water relationship: how can urban soils be transformed to support biodiversity?

While water bodies can paradoxically weaken their stand by achieving legal rights (O'Donnell 2018), a 'political ecology of things' perspective (Bennett 2010) may strengthen the value of all water flows, especially in the need of a new environmental justice for the city (Morizot 2024; ETH 2020) in a climate that is becoming drier (Bertrand 2023). Can a new awareness of urban water help recognise the global necessity (Latour 2015) of a new ecological balance with the larger territory?

Uncovering the potential of community energy actions to cope with energy poverty in remote areas: a systematic literature review

Author: Alessandra Longo¹

Co-authors: Linda Zardo¹; Matteo Basso¹

¹ *Iuav University of Venice*

Corresponding Authors: mbasso@iuav.it, alongo@iuav.it, lzardo@iuav.it

Energy is one of the essential services that everyone should have access to, as identified by the European Pillar of Social Rights. Nevertheless, according to Eurostat, in 2023, an average of 10.6% of the European population was in a condition of energy poverty, i.e. could not afford to keep their homes adequately heated. For some Mediterranean countries (Portugal, Spain, Bulgaria, Turkey) and Lithuania, this percentage exceeded 19% and reached about 21%. Against this backdrop, alleviating energy poverty becomes crucial to fostering a fair and equitable transition. However, the design of effective policies to reduce energy poverty in the EU is a challenge that faces several barriers, including the lack of (i) a shared definition of energy poverty at the European level, (ii) a set of common indicators to measure and monitor it, and (iii) the disaggregation and spatialisation of data.

Energy poverty is multidimensional and thus depends on a plurality of factors, both individual (income, living conditions, available technologies, health-related needs) and external (energy price, climatic conditions, which are also exacerbated by climate change). In addition, energy poverty represents a form of spatial injustice regarding the geographical issues of resource accessibility, production, and distribution.

The 'Clean energy for all Europeans package', adopted by the EU in 2019, introduced the concept of energy communities to denote forms of citizen-driven energy actions able to accelerate the clean energy transition and foster social innovation. Regarding the latter, engaging and empowering citizens can fundamentally impact sustainable behavioural change for consumers, who become energy prosumers, thus helping to transform the energy system. Moreover, this engagement is extended to all consumers, regardless of socio-economic status. Hence, energy communities represent a valuable tool in responding to energy poverty. Despite this promising picture, evidence of their contribution to a just and sustainable energy transition in Europe is still lacking: further experiences, scientific studies, and analysis tools to capture their potential in energy poverty alleviation are thus needed.

This work addresses these gaps from a spatial planning perspective while adopting a socio-ecological justice lens. Indeed, it investigates practices of clean energy production through multi-purpose community actions, focusing specifically on remote areas, typically rural and remarkably impacted by poor energy access and socio-economic disadvantage. It discusses the results of a systematic literature review conducted in two phases to investigate possible access to such practices. Through a keyword analysis - in Scopus - of titles and abstracts, the first phase collects publications since 2000 with one or more EU case studies in which three research domains - namely, clean energy production, community actions, and remote areas - appeared jointly. The second phase explores the links between domains and identifies those publications with the highest relevance to the research objective. Out of 1127 publications collected, the number has

eventually been reduced to 67.

Based on the results obtained, the contribution discusses several issues, including (i) in what geographical contexts and subject areas they are addressed, and concerning the relevant publications identified, (ii) what are the elements that generate success or problematic situations, (iii) what is the degree of citizens engagement, and finally (iv) which is the primary publication's scope or output, e.g. assessment, modelling or implementation. In conclusion, the contribution questions to what extent the available instruments and identified initiatives can be improved with a view to remote areas.

UNFAIR PROXIMITY The coexistence of energy infrastructures in marginal territory, reemerging conflicts, unfair supply, and unbalanced governance

Author: Fabrizio D'Angelo¹

¹ *Roma Tre*

Corresponding Author: fabrizio.dangelo@uniroma3.it

The territories of energy production often do not coincide with those of their consumption. The "energy footprint" of urban areas has always extended over increasingly large basins, shaping distant and detached territories and creating "reciprocal landscapes." For example, for much of the 20th century, hydropower production has particularly impacted alpine territories near urban areas, marginal and fragile regions both in socio-economic terms and in terms of representation and self-determination. The construction of these infrastructures has not merely juxtaposed with the existing forms of territories but has instead led to drastic transformations, including the physical erasure of landscapes (valley submersions) and the alteration of natural and economic metabolisms (reduced water flow has changed river ecosystems and related activities). Over time, these infrastructures have failed to provide benefits to the surrounding areas (in many cases, the regions hosting the plants were the last electrified) and have even caused catastrophic repercussions (e.g., the Vajont disaster). These events are not as distant from us as they may seem. Today, energy transition policies and pressing narratives about energy and water security have once again turned the spotlight on mountainous regions and their potential infrastructural development, reviving long-standing tensions. However, something new seems to be emerging in this era of re-infrastructuring: historical memory and the growing awareness of local communities have fostered a widespread network of conflicts, forcing a reassessment and redesign of these projects. This situation presents an opportunity: acknowledging and giving agency to these conflicts by emphasising their spatial dimension could enable a fair and balanced design that considers both the external interests of the infrastructure and the local needs of the communities (human and non-human) living nearby.

This contribution aims to reinterpret five stories of conflict in the Piave basin in the Eastern Italian Alps, highlighting often latent but ever-present spatial and design-related issues. The construction of small hydroelectric plants, the reconfiguration of a high-voltage power line, the management of an old hydroelectric reservoir, and the funding for a new one for water supply all serve as examples of the new forms of territorial injustice tied to hydropower. At the same time, these cases reveal new potential design approaches that emerge from conflict and strive for a balance between external and local interests.

Ecological Strategies for Historic Center of Lima: Camaná Linear Park

Author: Brandon Andía Concha¹

Co-author: Vanessa Oblitas Tarazona¹

¹ PROLIMA, Deputy Division of Planning, Management, Recovery, and Safeguarding of Lima's Cultural Heritage

Corresponding Authors: vanessa.obt@gmail.com, brandon.andia_0@munlima.gob.pe

The Historic Center of Lima is an urban palimpsest that reflects the various stages of the city's growth. The initial orthogonal and regular grid, typical of hispanic cities, was altered during the 20th century by massive road widening projects that prioritized automobiles over pedestrians. This process led to an inadequate distribution of available urban space, as vehicular asphalt areas prevailed over vegetated zones and shaded spaces. This street configuration contributed to the generation of heat islands and temperature increases in the Historic Center compared to other areas of Lima with greater vegetation coverage. Furthermore, the expansion of vehicular areas accelerated the degradation of air quality, as evidenced by pollution levels that exceeded the maximum permissible limits established by the WHO.

To counteract these effects, the redesign of road widening projects is proposed, transforming them into pedestrian boulevards that function as green corridors while maintaining minimal vehicular areas. This strategy seeks to restore the historical, urban, and ecological value of this heritage zone. In this context, the Camaná Linear Park emerges as a flagship project to provide green infrastructure for the city: it proposes the pedestrianization of an underutilized vehicular space resulting from an incomplete road widening project extending across only three blocks. The intervention envisions renaturalizing the street and converting it into an ecological corridor that connects public spaces near the Rímac River with the 'Parque de la Exposición', one of Lima's most important green areas.

This proposal not only promotes the integration of the area's commercial dynamics but also contributes to the revaluation of historical heritage and the renaturalization of the Historic Center. Moreover, it will provide the city with essential ecosystem services, such as temperature regulation and biodiversity conservation.

Mobile Commons and spatial justice in the face of climate change on the North Adriatic coast

Authors: Emanuel Giannotti¹; Maria Chiara Tosi¹; Luca Velo¹

¹ Università Iuav di Venezia

Corresponding Authors: lucavelo@iuav.it, mariachiara.tosi@iuav.it, egiannotti@iuav.it

The North Adriatic coastline has undergone profound transformations due to the interplay of human interventions and natural forces. Two major modernization projects, in particular, have reshaped the region: the early 20th-century land reclamation efforts, which converted marshy areas into productive land, and the extensive developments that established coastal resorts, now among Italy's leading tourism sectors. However, agricultural productivity in the reclaimed areas is in decline, while coastal tourism faces the crisis of mass beach tourism. Today, climate change introduces new and urgent challenges, particularly rising sea levels, necessitating an examination of spatial justice (Soja, 2010) and mobility commons (Sheller & Urry, 2006; Sheller, 2018) in the region. This paper investigates the modalities and impacts of climate change on the North Adriatic and explores future mobility and adaptation strategies. It emphasizes the uneven distribution of climate change effects across different territories and the role of planning processes in either mitigating or exacerbating social and spatial inequalities. Employing a qualitative, multi-method approach, the research integrates interviews, policy document analysis, and a review of European projects. Based on the collected data, a 'Scenario 0' (business-as-planned) is formulated to identify current trajectories and gaps in long-term strategic planning, while future scenarios are developed under the hypothesis that promoting slow forms of mobility can drive a more just transformation of the territory.

Results indicate that climate change has only recently emerged as a concern in the North Adriatic. While European projects reflect a growing awareness, their approach remains incremental rather than transformative, and planning documents still lack concrete adaptation measures. Interviews with local administrators reveal varying levels of concern, but climate change is not yet perceived as an urgent issue. This lack of adequate recognition, coupled with the limited implementation of adaptation strategies, is already contributing to unequal impacts across different territories and populations—disparities that are expected to intensify in the coming years. In regard to mobility, conflicting trends are evident. On one hand, investments in high-speed infrastructure reinforce territorial centralities and enhance economic competitiveness, often prioritizing tourism-driven growth over local needs and environmental justice. On the other, certain local initiatives promote alternative, slower mobility networks aimed at fostering sustainable territorial development beyond seasonal tourism. These initiatives have the potential to improve spatial justice by ensuring more equitable access to resources and mobility opportunities.

SS_02 DISCUSSING SPATIAL JUSTICE FROM/TOWARDS A SOCIO-ECOLOGICAL PERSPECTIVE / 1908

Brussels's not an island. A critical reflection on the places of multispecies spatial injustice

Author: Anastasia Battani¹

¹ *Iuav University of Venice, Doctoral School of Project Cultures, Urbanism*

Corresponding Author: abattani@iuav.it

The need to expand the idea of justice from the individual human subject to the non-human and the planetary is increasingly recognized today, thanks to a growing body of theory nurtured by Indigenous, decolonial, and feminist posthuman philosophies (Winter, 2022). The emerging field of Multispecies Justice recognizes the interconnectedness of human and other-than-human oppression, seeking to build fairer interspecies relationships (Celermajer et al., 2021). Here, the role of urban design and planning is compelling, as the design of space is part of a biopolitical action that has an inherent responsibility to make space (or not) (Secchi, 2015) for the living to thrive. As Metzger notes (2023), even in the “impossibility” of the perfect coexistence for all beings simultaneously in any space, planning can certainly act on reducing the degree of violence and segregation that its processes produce.

In reasoning about socio-ecological spatial justice, I argue that a multispecies justice framework can help unveil blind or overlooked injustices spots. Indeed, the landing of this sensibility into urban design practice questions us about its spatial repercussions. Where do the social and ecological demands create friction when we consider the interests of all the species and other-than-human actors involved, and not just human well-being?

Drawing on interviews and fieldwork in Brussels with people involved in projects using a more-than-human approach (students, engaged citizens, urban practitioners, university researchers, administration workers, etc.) I propose a critical reflection on the places of multispecies spatial injustice, helped by a radical ecological standpoint that seeks nothing less than the emancipation of the living (Ouassak, 2024). Alongside spaces where transspecies socio-ecological injustices are more evident (i.e. contested undeveloped abandoned land in the compact city), the research underpins how the major sites of violence were deliberately planned out-of-sight/out-of-town and still are often forgotten in the major discourse about city ecological transition, where the Brussels capital region is depicted as an island forgotten of its territory.

Re-mining Punta Corna. A Laboratory on the Local Impacts of the Critical Raw Material Act in the Alpine Region

Authors: Elena Longhin¹; Luis Martin Sanchez²

¹ TUDelft

² Politecnico di Torino

Corresponding Authors: luis.martin@polito.it, e.longhin@tudelft.nl

The transition to a clean energy economy necessitates securing critical minerals—such

as nickel, copper, and cobalt—essential for advanced technologies and low-carbon solutions. The European Critical Raw Materials Act (2023) seeks to enhance the EU's self-sufficiency by mandating domestic sourcing of mined, processed, and recycled materials, while addressing the geopolitical challenges of dependence on external suppliers. This proposal explores the environmental and socio-economic implications of renewed extractive activities in Europe, focusing on the Alpine landscapes, particularly investigating Italy, which possesses 16 of the 34 critical raw materials identified in the Act but lacks active metal mining since the 1970s.

Our investigation centers on the proposed strategy by the Italian government to revitalize old and open new mines, particularly in the Alpine regions, alongside the need for substantial technological investments. Among the significant sites is Punta Corna, once Europe's largest cobalt mine, now a focal point for examining the clash between extractivist development and sustainable local economies rooted in tourism. Through a cartographic analysis, we analyze the competing narratives surrounding these mining initiatives, characterized by a traditional extractivist model and the "enrichment economy" (Boltanski & Esquerre, 2019) which emphasizes ultra protective territorial development strategies as territorial patrimonialization. This contrast raises critical questions about the sustainability of mining projects and their alignment with the values of local communities experiencing peripheralization and depopulation.

Our findings shed light on the intricate conflicts arising from rare earth extraction, illustrating the tension between economic aspirations and environmental integrity but also across different development paradigms. By framing Punta Corna as a case study, exploring its extractivist dynamics as advantaged laboratory for understanding the fears and hopes of local communities linked to the European Critical Raw Materials Act projects, we aim to ultimately contributing to broader discussions on sustainable resource governance and the socio-political complexities of extractive economies.

Ecopublica: a tool for socio-ecological emancipation

Authors: Elisa Scattolin¹; Michela Pace¹; Luca Velo¹

¹ *Iuav University of Venice*

Corresponding Authors: mpace@iuav.it, escattolin@iuav.it, lucavelo@iuav.it

The paper proposes to explore the issue of spatial justice through the concept of the eco-public network, conceived as the intersection of spaces that integrate ecological and social values.

North-East Italy, the object of this analysis, is characterised by a recurrent tendency towards disconnection, with a growth model that has produced fragmentation and territorial, economic and environmental fragility. However, the wide meshes of this territory suggest new opportunities for enhancement, focusing on open space as a de-polarised ecological framework of variable intensity, which is activated and reorganised on the basis of multiple factors and conditions. This network involves on the one hand physical and spatial elements (urban and rural open spaces, open porosities in the urbanised area, slow mobility routes, collective infrastructures, community spaces), and on the other hand expectations and imaginaries that over time have defined ecological roles and values in relation to uses and practices.

Observing the eco-public network, with its uneven and plural movements, allows us to

reflect on the very essence of the project and the need to recognise spaces, subjects and collaborations of potential transformation, as in the proposed case of the renaturation of the Stella River. Among the actors of change are human and non-human subjects that make it necessary to explore the topic of cohabitation, of new possible alliances and conflicts, including spatial ones. In this context, there emerges the need to promote what we might call ‘weak projects’: minor, open and processual projects that rely on a constantly changing framework, and that reflect the action of non-hierarchical and secondary subjects.

The spatial achievements that characterise these projects are often fragile, charged with emancipatory tensions, and subject to external pressures. However, recognising their potential allows us to test the circularity between prefiguration and exploration: past the time of the ‘grand urban project’, we are called upon to experiment with an open, possibilist and pragmatic attitude, where even different, secondary or vulnerable subjects are recognised as having the capacity for change and spatial rights at multiple scales.

Designing good life for all. Explorations on “fragile” neighbourhoods in Trieste

Author: Elena Marchigiani¹

Co-authors: Sara Basso¹; Teresa Frausin¹; Valentina Novak¹

¹ *University of Trieste*

Corresponding Authors: teresa.frausin@dia.units.it, sara.basso@dia.units.it, emarchigiani@units.it, valentina.novak@dia.units.it

In Europe, multiple crises (economic, environmental, social, demographic, ...) are impacting the quality of life in urban contexts, with direct consequences on the “affordability” of housing and the resilience of welfare facilities. While sustainability, inclusivity, and accessibility “for all” are central to many urban regeneration interventions, their translation into local actions often suffers from vague strategies and, in the worst cases, results into depoliticized processes, gentrification and speculative dynamics displacing residents (Checker, 2007; Swyngedouw, 2007). Strong is, therefore, the need for a project-oriented reflection on: i) the spatial conditions of comfort; ii) the policies, actions and actors for their “just” implementation.

The paper questions the conditions of poverty and fragility that are growing in many European cities. “Poverty” is framed as a multidimensional phenomenon encompassing material, relational, and contextual factors that constrain well-being, making people “fragile” by limiting their opportunity to build and maintain a decent quality of life (Sen, 1976; Bourguignon & Chakravarty, 2003; Aaberge & Brandolini, 2015). From this perspective, space is understood as a “capacitating” infrastructure (Sen, 1993; Nussbaum, 2011), that can either worsen or help reduce fragility conditions. Consistently to this, urban design is called to overcome a binary view of private space versus public space towards a networked approach integrating services, open spaces, and welfare equipment to create more accessible and personalized support to well-being.

The paper describes “research by design and action” developed in marginal parts of the inner city of Trieste, a medium-sized Italian city facing population aging and decline, economic distress, gentrification, and rising pressure on welfare facilities. The research

involves: (i) mapping spatial indicators of poverty, including housing, food accessibility, socio-relational, and environmental conditions; (ii) engaging local stakeholders in dialogue and fieldwork; (iii) developing design explorations on underutilized spaces to strengthen the relationship between collective facilities and open spaces.

Revitalizing the Po Valley's margins: challenges, strategies and future prospects

Author: Sara Caramaschi¹

Co-author: Cristiana Mattioli ¹

¹ DASTU Politecnico di Milano

Corresponding Authors: cristiana.mattioli@polimi.it, sara.caramaschi@polimi.it

Among Italy's many "middle lands," the Po Valley's lower plains (Bassa Padana) remain one of the least studied. This area, stretching across Lombardy, Emilia-Romagna, and Veneto, has long been perceived as marginal and economically depressed. However, recent years have seen profound transformations reshaping its spatial structure, socioeconomic fabric, and collective identity.

The Bassa Padana represents a vital yet fragile agricultural heartland. Its highly mechanized agro-industrial system, intensive livestock farming, and historically abundant water resources are now facing severe environmental challenges, including water scarcity, soil degradation, and climate change pressures. Urbanization remains limited, with small towns dotting the landscape, while industrial sectors such as mechatronics, biomedical, and household appliances concentrate in the more dynamic western areas. This contribution critically examines the area's evolving dynamics. On one hand, processes of marginalization, demographic decline, and economic downturn exacerbate a sense of isolation. On the other, territorial development initiatives focus on revitalizing local heritage, fostering new economies, and integrating diverse cultural influences. The interplay between sustainability-driven local projects and the pressures of agro-industrial and logistics expansion raises key questions about the region's future. The contribution also invites reflection on the risks and opportunities of the area's development model in the face of climate and social change.

Attempting coproduction, (strategically) misunderstanding coproduction, failing coproduction? Motivations, positionalities, challenges and (concrete) experiences in coproduction processes on left-behind places in Lombardy, Italy

Author: Sara Caramaschi¹

¹ DASTU Politecnico di Milano

Corresponding Author: sara.caramaschi@polimi.it

The newly emerging housing question is widely considered to be exclusively affecting large metropolitan regions. This is also true for Italy, where Milan –and its metropolitan

region –have become the hotspot of a housing supply and affordability crisis that does not seem to mitigate in anyway. However, many peripheral areas in the region of Lombardy are experiencing high stress in their ability to answer housing demand.

Forms of loosely defined coproduction are widespread in area-based, integrated policies in the European space. National and regional governments –as well as local ones – increasingly recur to the mobilisation of external actors to define and implement strategies, both to confront a crisis of legitimacy that affects the political system and its executive apparatuses while exercising governance “at a distance” and to mine more profound and more extensive knowledge deposited with the social organisation. These processes are especially evident in large metropolitan areas, but they are making themselves more and more visible in rural or peripheral urban environments, i.e., left-behind places. National institutional design, governance, and participation legacies matter significantly in Europe. However, we can say that Such contexts are less used to this kind of exercise; therefore, reflecting on the conditions and challenges of their implementation there is of utmost scientific interest.

The paper intends to address this issue by presenting a long-term, comprehensive coproduction exercise conducted since 2022 by a working group of planners, geographers, sociologists and architects of the Department of Architecture and Urban Studies at the Politecnico di Milano, Italy, in the framework of an agreement with the regional government of Lombardy. The agreement –framed as a coproduction accord between regional technical apparatuses and a research institution –is aimed at supporting regional offices and local actors in the design and implementation of area-based integrated strategies involving 14 areas deemed left-behind places. The group engaged in sustained exchanges with regional officers and in the organisation of local workshops with over 1400 participants. What forms of knowledge and labour are involved in the coproduction of place-based policy and their implications for the understanding of professionals and policy-makers? 2. What new organisational modes and institutional forms are emerging for the coproduction of place-based policy and the relative implications for researchers, universities and funders? 3. how does the coproduction of place-based policy relate to ideas and movements for foundational and everyday economies, just transition, degrowth, postextractivism and regenerative economies?

The more the regenerative projects and experiments of paths of epopulation of the left-behind territories and mountainous areas advance, the more a fact emerges forcefully: the concrete difficulty of welcoming and accommodating, transforming them into inhabitants, the various people who today, in Italy, seem to express a growing demand for mountains.

This finding that emerges from the experiences taking place in the territories severely contradicts what has always been a powerful discursive element in favor of regeneration projects in left-behind territories: the existence of a considerable housing stock that is highly available and favorable - by quantitative size, economic value, etc. - for implementing revitalization and repopulation policies.

Instead, in Italy, all experiences in the field show how the conditions of technological and

qualitative backwardness of the existing stock the difficulties in finding housing units on the rental market make this issue today a priority concerning policies on left-behind territories in recent years, traditionally focused on the triad health, schooling, mobility. Many realities in the Alps and Apennines where regeneration pathways are underway show attempts to build neo-inhabitable conditions through the “autarkic” construction of housing and welfare services for neo-population. However, it is clear that these virtuous actions characterized by “do it yourself” are not sufficient to build real and effective widespread action to support potential neo-housing processes.

Our research is positioned within this challenging framework. It aims to address issues regarding housing possibilities and models suitable for repopulation dynamics, both in terms of policies and projects for sustainable rents and possible public action at the local and national scale for the activation of projects that take into account at the same time housing, employment and access to culture and community-making needs.

Navigating (Im)mobility and alternative development in Left Behind Areas: Insights from Valle di Viù, Italy

Author: Astrid Safina¹

Co-author: Barbara Staniscia¹

¹ *Sapienza Università di Roma*

Corresponding Authors: astridsafina@gmail.com, barbara.staniscia@uniroma1.it

Human mobility has been investigated as a key factor in the challenges faced by left-behind areas (LBAs), yet its actual capacity to drive sustainable development remains underexplored. This study critically examines the case of Valle di Viù, a mountain area in the Turin Metropolitan Area, Italy, to explore the limitations, contradictions, and potential of relying on human mobility to address the problems of depopulation, ageing demographics, decaying infrastructure, and an overarching sense of left-behindness in mountain areas.

While inward mobility present opportunities for revitalization —for instance through the return of former residents and the attraction of newcomers —structural challenges persist. Residents often experience social isolation, infrastructure exists in precarious and intermittent forms, community resources are stretched thin, and local economies struggle to accommodate new residents or retain existing populations.

Drawing on in-depth interviews with key players and individuals conducted in Valle di Viù, this study examines the perceptions and livelihood practices of (im)mobil people across various life domains to understand micro-strategies for coping with peripherality. It also analyses policies and projects addressing LBAs at different scales and their impacts on specific local contexts. The analysis focuses on three specific dimensions: first, conventional development strategies primarily linked to infrastructure provision; second, non-conventional strategies emphasizing well-being, quality of life, local identity, and place attachment; and third, (im)mobility dynamics that consider not only in- and out-mobility but also recognize immobility as a critical component of local development.

Preliminary findings suggest that mobility-driven development should be associated to the removal of structural barriers to reduce the risk of exacerbating disparities. This underscores the need for systemic policies and place-based actions to ensure equitable access to resources and opportunities. Furthermore, the study highlights the importance

of nuanced, context-sensitive approaches to address the underlying causes of marginalization in LBAs.

Social Infrastructures for Repopulation: Learning from ‘School Zones’ in England

Author: Lucy Natarajan¹

¹ *Bartlett School of Planning, UCL*

Corresponding Author: lucy.natarajan@ucl.ac.uk

Across diverse sized cities in England, School Zones are a new way to plan for districts centred on securing the next generation’s well-being in disadvantaged areas. This paper teases out lessons for repopulation from social infrastructures, which is demonstrated by such zones around public educational facilities in England. The paper builds on a recent study of ‘School Superzones’ in London (Natarajan, 2025) as well as concepts of social infrastructures to generate alternative forms of value for declining places (Tomaney et al., 2024). School Zones step up to the lack of delivery on maintaining long-term community wellbeing (Natarajan et al., 2020), and harnesses community capitals inherent in educational facilities through local partnerships. These offer non-growth dependent value generation and support place attachment, with generation of local social value and place-based liveability. As such, in respect of population-challenged areas of Europe, School Zones have great potential. Drawing on research in targeted districts in Brighton, Birmingham and London, the emerging outcomes of School Zones will be explored, including insights from those involved in partnerships around these initiatives, i.e. stakeholders from civil society, local businesses and government actors. Analysis centres on the question: how might School Zones pre-figure means to long-term thriving communities that do not rely purely on the logics of capital investment or growth?

The European Union's (EU) ongoing energy transition, rooted on frameworks such as the European Green Deal and REPowerEU, seeks to balance climate commitments with goals surrounding energy security and economic competitiveness. As the EU reconfigures its energy strategies, member states are required to adopt more ambitious renewable energy targets within increasingly constrained timelines. This has given rise to heightened territorial tensions related to renewable energy development (Poggi et al., 2018; Rodríguez-Pose & Bartalucci, 2023; Vezzoni, 2023). In Portugal, recent updates to the National Energy and Climate Plan have set a significantly higher target for solar capacity, intensifying land-use pressures, namely in agricultural areas and forested land, with impacts in sustainable spatial planning. This study presents the Cohesion Policy as an essential financial tool for encouraging sustainable energy systems based on important characteristics of project funding in Portugal, presenting prospects for advancing climate and environmental goals. An analysis of projects funded between 2014 and 2020 under the five regional operational programmes and the Sustainability and Efficient Resource Use Programme (POSEUR) reveals that the Cohesion Policy has supported a diverse range of energy transition initiatives, including decentralised solar energy, renewable gases such as hydrogen, and energy efficiency initiatives. Moreover, a positive relationship was observed between funding and PV self-consumption, particularly in municipalities with higher CO₂ emissions from the industrial sector. Building on these findings, this study discusses potential future challenges and opportunities of Cohesion Policy, with a particular focus on co-location strategies promoting sustainable spatial planning.

SS_04 PLANNING FOR TWIN TRANSITION IN REGIONAL AND URBAN SYSTEMS / 1946**Planning for Clean Transport: Role of Electric Vehicles and Hydrogen Energy in Urban and Regional Systems****Author:** M.B. Sushma¹**Co-author:** Igor Sirnik²¹ *Wageningen University*² *Wageningen University and University of Ljubljana***Corresponding Authors:** sushma.marangantibhatter@wur.nl, igor.sirnik@wur.nl

Electric vehicles (EVs) and hydrogen-based energy systems are emerging as transformative solutions in the transportation sector, offering the potential to significantly reduce carbon emissions and promote a cleaner environment. By 2030, hydrogen is expected to complement other renewable energy sources, playing a pivotal role in the energy transition alongside EVs (Tran et al., 2023). However, the integration of Twin Transition in transport depends on the equitable distribution of EV charging stations (EVCS) and hydrogen refueling station (HRS). To address social inequalities in infrastructure placement, this study is guided by research question: What are the socio-economic, environmental, and demographic factors that quantify spatial inequity in EVCS and HRS access?

This study presents a decision-making framework for developing policy recommendations to evaluate the optimal siting EVCS and HRS based on incorporating stakeholders' preference (i.e., cost, congestion, environmental considerations) and socioeconomic and demographic factors. Recent studies conducted studies on spatial planning of EVCS and HRS focused on minimizing investment costs (Xu et al., 2018), optimizing traffic flow (Tran et al., 2023), and managing charging schedule (Gong, D., 2019). However, a significant gap persists in addressing equity concerns related to the spatial distribution of EVCS and HRS infrastructure. We propose a GIS-based Multi-Criteria Decision-Making (MCDM) model that integrates socio-economic, environmental, and demographic factors to assess spatial inequities in access to EVCS and HRD (Rashmitha et al., 2024). The model's efficacy is validated through a city Warangal (India), recognized for promoting sustainable mobility (PM E-DRIVE, 2023). The Warangal city covers an area of 46.821 km², and its existing network of EVCS and HRS provides a suitable setting for validating the proposed framework.

Preliminary results identify vehicle ownership, population, household income, education level, major road connectivity, and proximity to utility areas as key factors influencing placement of EVCS and HRS. The regions in Warangal are categorized into low, medium, and high inequity levels. Approximately 63% of the region falls within high-inequity zones and are characterized by low vehicle ownership, high population density, poverty, limited education access, and inadequate median household income. These areas also lack proper power grids and road connectivity, increasing EVCS installation costs and discouraging investment. However, the majority of the population in these areas is aged 20–40 years, indicating a strong potential for future EV demand. The current and predicted EVCS and HRS placements also failed to account for evolving EV adoption, policy shifts, and grid constraints, worsening infrastructure disparity. Additionally, limited awareness and affordability create further inequities.

The integration of EV and hydrogen infrastructure is essential for achieving the Twin Transition in transport, where green and digital innovations converge to create resilient, inclusive mobility systems. This study aims to address emerging disparities in EVCS and HRS accessibility by developing a generalizable framework to quantify inequities in station placements. The framework enables policymakers to identify underserved communities and direct targeted infrastructure investments to ensure widespread EV and hydrogen vehicle adoption. By incorporating socioeconomic parameters, such as income levels, population density, and major road connectivity, the study ensures that infrastructure planning aligns with the needs of lower-middle-income populations, improving accessibility and equity over time. In future study, we aim to extend these findings by integrating ground truth data from existing EVCS and HRS to refine predictive modeling. AI-driven GIS models can generate predictive maps of EVCS and hydrogen infrastructure placements based on the identified environmental, socioeconomic and demographic factors. These predictions can be validated against real-world infrastructure data, ensuring accurate, data-driven decision-making. To conclude, this study created policy recom-

mentations that contribute to both environmentally sustainable and socially equitable mobility system.

Twin Tools of the Global to Local to Global Geodesign for Climate Change Mitigation Project

Author: Tijana Dabovic¹

¹ *University of Belgrade Faculty of Geography*

Corresponding Author: tijanadb@gmail.com

Climate change caused by increasing atmospheric greenhouse gas concentration poses a significant threat to life on Earth. Climate change mitigation, adaptation, and resilience are identified as narrowly connected concepts and actions needed to address this threat. However, the window for addressing climate change is shrinking as time is passing and needed action is lacking. If the global community fails to mitigate climate change in the next decades, climate adaptation and the resilience of local communities will become increasingly difficult.

In the past year, team of the International Geodesign Collaboration (IGC) Global to Local to Global (GLG) Climate Change Mitigation Project: Carl Steinitz, Harvard University and UCL, Pedro Arsenio, University of Lisbon, Michele Campagna, University of Cagliari and Tijana Dabovic, University of Belgrade developed an integrated geodesign framework for spatially and temporally designing and implementing climate projects. The GLG strategy explicitly focuses on creating a scalable workflow compatible across diverse jurisdictions, geographic scales, and time frames towards reducing atmospheric greenhouse gas concentration by 2050. It combines global perspectives and science with national, regional and local insights and feasibility, facilitated by digital technologies, primarily ArcGIS Online Organisation (IGC GLG portal through which users can create, manage, and share maps, apps, and data), ArcGIS Pro (software with innovative tools for managing spatial data and performing advanced mapping analytics), and Geodesignhub (geodesign digital collaboration and negotiation platform).

The GLG workflow is anchored in the GLG list of climate projects. Selected after a literature review, a total of 117 global climate projects contributing to sequestration/biodiversity and ecosystems enhancement and/or emissions reductions are organised in 8 systems/sectors –Oceans, Water, Forests and Grasslands, Agriculture, Settlements, Transport, Industry and Energy. All projects are globally assigned to expert maps and AI-assessed for their costs and benefits in reducing GHG emissions. Using the Steinitz's (2012) geodesign framework and digital tools and data, local teams can select and negotiate locally relevant climate projects considering the past carbon emissions and sinks, societal, economic, and political readiness for climate mitigation, as well as to 2050 projections of their climate regions, LULCs, and ecosystem changes. The local geodesign/plan for climate change mitigation is presented in the Gantt chart and a map. In turn, all collected local geodesigns of climate change mitigation are digitally processed and used for making the Global design and tested against global optimisation models. These serve to identify the gaps between capable, suitable, and feasible scenarios of the Global to Local to Global climate change mitigation by 2050. The IGC GLG team will make these resources freely accessible, enabling nations and communities to explore different spatio-temporal scenarios and geodesign and implement effective climate strategies globally and locally.

Teleworking in the EU Digital Transition Framework: Case-study of Portuguese Territories in Post-Covid Times

Author: Pedro Franco¹

Co-authors: Eduarda Marques da Costa ¹; Ana Iouro ¹; Paulo Morgado ¹; Nuno Marques da Costa ¹

¹ *Centre of Geographical Studies (CEG), Associate Laboratory TERRA, Institute of Geography and Spatial Planning (IGOT), Universidade de Lisboa*

Corresponding Authors: analouro@edu.ulisboa.pt, pedrofranco@edu.ulisboa.pt, paulo@edu.ulisboa.pt, eduarda.costa@edu.ulisboa.pt, nunocosta@edu.ulisboa.pt

The European Union's policy framework increasingly emphasizes the need for a Twin Transition, wherein the Green Transition converges with the Digital Transition to foster sustainable and inclusive development (EC, 2022). However, for the transition to happen, particular attention should be paid to territories where digital infrastructure gaps may impede the benefits of smart solutions (usually peripheral or urban ones) (EC, 2024) and thus hamper competitiveness and economic opportunities in underserved regions (Draghi, 2024; Morris, 2022). Although remote work has long existed, its surge during and after the pandemic has redefined consumption, mobility, and spatial organization, posing both opportunities and challenges for sustainable development and regional inequalities (Braesemann et al., 2021). After the COVID-19 pandemic, teleworking evolution altered, meaning that the factors behind teleworking adoption levels should be assessed, particularly at the local level, a scale often neglected, while also searching for territorial typologies inequalities. In this study we aim to analyze these factors within the Portuguese municipalities (local level), comprehending if adoption levels tend to be

caused by the economic activities/companies' endogenous factors (sector of activity, dimension, wages, etc.) or exogenous factors (namely the sociodemographic and territorial, like household composition, migration, digital infrastructure, etc.). However, scarce local-level data hinders the comprehensive understanding of this phenomenon, in the Portuguese case (a paramount example), national statistical systems do not allow monitoring of teleworking dynamics over a long period or on a local scale. To surpass this obstacle, we propose a novel methodological framework to quantify and spatially analyze teleworking dynamics: 1) to develop a methodological approach to understand how data relating to commuting movements collected at census or specific survey moments (municipal level), can quantify the phenomenon and evolution of teleworking; and 2) identify territorial patterns relating to the preponderance of teleworking at the municipal level, as well as its main influencing factors either endogenous (activities) or exogenous (sociodemographic and territorial). For this, an indicator based on the Portuguese Classification of Professions was constructed, which was then utilized as a dependent variable in spatial regression techniques that used the endogenous and exogenous factors as regressors, enabling the exploration of spatial variations on these. The findings reveal that there is a mixture of endogenous and exogenous factors contributing to higher/lower levels of teleworking, with these having different impacts in urban areas and more peripheral or rural areas (like the example of digital infrastructure – a key to teleworking adoption –, or certain economic activities characteristics such as the company dimension). While some factors exert consistent effects across broader regions, others vary significantly locally, proving to have a more localized effect (vs. regional or national), underscoring the differentiated territorial capacities and challenges or opportunities of peripheral territories. Framed within the Digital Transition narrative, this research provides empirical insights into the transformative potential of teleworking for enhancing spatial systems resilience and urban and regional planning adaptive planning strategies, proposing a replicable framework for future analyses that surpass data scarcity. Moreover, these findings are critical for policymakers and stakeholders seeking to leverage Twin Transition for transparent, inclusive, and sustainable urban and regional governance through teleworking, while mitigating territorial inequalities.

Leveraging Social Entrepreneurship for Sustainable Urban Futures: Transforming Governance Through Grassroots Innovation

Author: Ebru Kurt-Özman¹

¹ *University of Amsterdam*

Corresponding Author: e.kurtozman@uva.nl

In urban contexts dominated by top-down governance, social entrepreneurship emerges as a key force in driving sustainable urban regeneration. It fosters grassroots agency and adaptive governance mechanisms. While state-led, redevelopment prioritizes economic

imperatives, local actors creatively navigate institutional constraints to make spaces for participation. The case of Sarıyer Derbent urban transformation project, Istanbul, illustrates how community-driven self-organization can transform urban governance through entrepreneurial strategies that challenge exclusionary policies.

One major outcome is the institutionalization of self-organization, where informal grassroots mobilization evolves into structured advocacy networks. In Derbent, neighbourhood cooperatives and associations have navigated legal frameworks, engaged in policy negotiations, and negotiated through entrepreneurial tactics to influence regeneration processes. These initiatives have disrupted state-driven urban renewal by re-politicizing governance structures. It demonstrates that local voices play an active role in decision-making.

Another key outcome is the emergence of adaptive governance mechanisms, where social entrepreneurs mimic the strategies of policymakers-in particular the state- and developers in some cases as in Fikirtepe to secure their rights. By utilizing digital platforms, legal tools, and strategic partnerships, Derbent residents transforms governance from an exclusionary model into a more responsive system. Their success demonstrates that social entrepreneurship is not just about economic innovation but also about reclaiming agency, reshaping governance, and ensuring urban regeneration serves broader social and environmental goals.

Community-driven processes, public funding, and social entrepreneurs in Italy's PNRR urban regeneration projects, a balancing act.

Author: Martina Massari¹

¹ *University of Bologna - Architecture Department*

Corresponding Author: m.massari@unibo.it

Community-driven urban regeneration has long been a significant topic in urban policies and planning, sparking debates on the potential of bottom-up approaches, the risks of top-down interventions, and the role of spaces and funding. Scholars agree that this phenomenon lacks a unified theory and requires empirical observation to understand its dynamics, rooted in trial-and-error practices and tailored techniques within the broader urban regeneration discourse.

A consensus among European scholars is that public actors must guide and ensure collective ownership of outcomes in community-driven urban regeneration. This approach guarantees that the benefits reach all citizens, including those unable—or excluded from—participating, but still affected by the results. This need for public leadership gains new relevance with the availability of unprecedented funding through programs like Next Generation EU and its National Recovery and Resilience Plans (NRRPs). These resources present a unique opportunity to implement ideas long discussed by scholars.

In Italy, the PNRR (Piano Nazionale di Ripresa e Resilienza) operates with the largest funding allocation in Europe, enabling cities—both municipalities and metropolitan cities—to orchestrate and directly implement urban regeneration projects. Under time constraints and the perception of a once-in-a-lifetime opportunity, many PNRR projects are targeting areas where slow, community-driven regeneration processes have long been underway. The injection of significant financial resources is, in many cases, addressing the challenges and limitations that community-led initiatives have faced in past decades. For instance, the Metropolitan Cities of Bologna and Florence are leveraging PUI (Programmi Urbani Integrati) funding to support regeneration projects in areas with established histories of community-driven actions, though each case presents unique characteristics.

The Former Cartiera Burgo in Bologna exemplifies an intervention centered on the large-scale requalification of a former industrial building. Here, the project designers opted to “inhabit” the construction site gradually, integrating local social entrepreneurs to properly territorialize the influx of financial resources. This approach is particularly significant for a small village that had never experienced such substantial investments.

Tenuta Mondeggi in Florence is another funded initiative where urban regeneration intersects with a longstanding community appropriation process of a former agricultural estate. This overlap highlights the potential for tensions and conflicts when large-scale public investments converge with grassroots initiatives.

Exploring the two cases of Bologna and Florence the contribution will critically illustrate if and how public funding under the PNRR has the potential to act as a catalyst for sustainable urban regeneration, particularly when it intersects with pre-existing community-driven processes. A critical element in this dynamic is the role of social entrepreneurs, who act as mediators and drivers of innovation in urban regeneration, their potential in mobilize local knowledge, resources, and networks, social entrepreneurs ensure that investments are not only efficiently utilized but also deeply rooted in the social and cultural fabric of the area.

Finally, the study highlights the evolving role of metropolitan cities as strategic actors, no longer merely coordinators but designers of interventions. It concludes with recommendations for optimizing community-led processes during periods of significant but temporary resource availability and reflects on how these lessons can inform sustainable development practices.

Socio-Spatial Innovation in Central and Eastern Europe: Insights from Regional Innovation Capacity Research (REGINNO)

Author: Sila Ceren Varis Husar^{None}

Corresponding Author: sila.husar@stuba.sk

The interaction of knowledge production, concentration and transformation into innovation shapes the regional economic capacity in Central and Eastern Europe (CEE). Socio-spatial innovation, a critical component of sustainable urban regeneration, provides a valuable framework for examining these dynamics. This contribution highlights insights from the Regional Innovation Capacity Research (REGINNO) project, which investigates regional innovation capacity at the NUTS 3 level in Slovakia and neighbouring CEE countries, exploring sectors, spaces, and human capital.

REGINNO adopts a spatial approach to innovation, applying local and global statistical models to analyse regional disparities and determinants of innovation. The findings reveal that geographical location and socio-spatial factors significantly impact innovative outputs, with unique patterns across different regional contexts. Furthermore, the research discusses the role of industrial cluster organizations and their intermediary functions in fostering regional knowledge networks, highlighting the need to rethink existing capacities for innovation-driven development.

Beyond identifying innovation disparities, REGINNO provides a research design for regional-scale innovation through spatial planning. The approach integrates knowledge production ecosystems, institutional frameworks and place-based governance to develop targeted innovation policies. The results indicate that while public research institutions play a vital role in regional knowledge creation, their cooperation with industry remains limited due to bureaucratic constraints and institutional inertia.

This special session emphasizes the importance of integrating socio-spatial innovation into planning and policy frameworks to enhance urban regeneration efforts. By addressing these regional dynamics, REGINNO contributes to a deeper understanding of regeneration of industrial spaces, innovation processes and pathways toward more resilient and competitive CEE regions.

From complex adaptive systems to anti-fragility and social innovation: The notion of resilience in metropolitan spatial planning

Author: Johannes Suitner¹

Co-author: Valeria Fedeli²

¹ *TU Wien, Institute of Spatial Planning, Research Unit Urban and Regional Research*

² *Politecnico di Milano, Department of Architecture and Urban Studies*

Corresponding Authors: valeria.fedeli@polimi.it, johannes.suitner@tuwien.ac.at

In the current polycrisis context, resilience has taken a prominent spot as a prime objective on the political agenda. In spatial planning, the concept has also received increased attention in the past two decades as a planning rationale for designing “future-fit” spatial structures and planning procedures. In that regard, the metropolitan region is particularly cited as a promising scale for ensuring resilient spatial development and dealing with the challenges of social-ecological transformation.

This paper presents the conceptual understanding of resilience in the context of metropolitan regions as currently debated in the ARL International Working Group “Resilient Metropolitan Regions”. We shortly introduce the concept’s social-ecological origins and recent differentiations in planning discourse to distill the five resilience principles of robustness, adaptability, learning, innovation, and governability as a general rationale for addressing and assessing substantial and procedural aspects of metropolitan resilience.

We then explore the concept’s evolution towards anti-fragility, that is, the ability to take advantage of uncertainties and disruptions, turning vulnerability into opportunity. In particular, we illustrate (i) how modern crises can be interpreted as opportunities to reorganize and improve existing structures, (ii) why a territorial perspective is necessary to assess resilience and how it can foster anti-fragility, and (iii) why a perspective on (planning) institutions matters particularly to ensure resilience.

To conclude, we discuss some key ambivalences that these rationales imply on the substantial and procedural level of metropolitan planning: On the substantial level, we emphasize the ambivalence between redundant and sustainable infrastructure systems, decentralization and polycentricity. On the procedural level, we discuss the ambivalence of legitimacy vs. agility/flexibility of (planning) institutions and what this implies for often-heralded social and governance innovations in planning.

Spatial Planning at a time of climate change: Dutch metropolis to Eurodelta Megaregion

Author: Alankrita Sarkar¹

Co-author: Paul Gerretsen²

¹ *Delft University of Technology*

² *Deltametropolis Association*

Corresponding Authors: paul.gerretsen@deltametropool.nl, a.sarkar-4@tudelft.nl

The shifting focus from the development of Dutch metropolis to the Eurodelta megaregion represents a paradigm shift in spatial planning, emphasizing the need for collaborative, interscalar approaches to address complex challenges. The Eurodelta, a non-formalized metropolitan scale, offers unique opportunities for redefining governance and planning practices beyond traditional administrative boundaries. This presentation explores why the Eurodelta scale is crucial in fostering climate transitions and enhancing resilience, while crossing several borders of sectors, administration, values, planning systems and governance. This presentation calls for a critical discussion on how interscalar and collaborative approaches can drive transformative resilience strategies, offering a new exploration of the evolving roles of planners and designers.

Drawing on lessons from Dutch spatial planning, the presentation highlights scenario-based methodologies, interscalar and integrative design and planning practices that address climate challenges and socioeconomic transitions. This presentation will emphasize on informal planning procedures research by design approaches, frameworks for shared knowledge and exchange, fostering an interplay across scales and sectors. By shifting the focus toward the changing roles of designers and planners, the presentation aims to spark a dialogue on innovative approaches to resilience. How can planning evolve to navigate the complexities of climate transitions and ensure equitable outcomes? What new methods and collaborations are needed to create adaptable, future-proof megaregions? This dialogue seeks to exchange knowledge and ideas across disciplines and regions, advancing the global conversation on crossing borders for resilience and sustainable spatial development.

It Takes a Metropolis and Even a Megalopolis to Become Resilient: Lessons from Bologna and Marmara

Authors: Alessandro Delpiano^{None}; Görsev Argın Uz¹

¹ *Marmara Municipalities Union*

Corresponding Authors: gorsev.argin@mbb.gov.tr, alessandro.delpiano@cittametropolitana.bo.it

This presentation will explore two distinct yet complementary case studies that exemplify unique and synergistic approaches to urban resilience: the Metropolitan City of Bologna in Italy and the Marmara Region in Türkiye, a megalopolis comprising six metropolitan areas. It will deal with complex problems like including rapid urbanization, climate change, widening social and economic disparities that require innovative approaches (for ex. new finance tools) and utilise the strengths of urban planning and cooperative administration.

In 2021, the Metropolitan City of Bologna established the Metropolitan Equalization Fund, aligned with the strategies outlined in the Metropolitan Area Development Plan ("PTM - Piano Territoriale Metropolitano"). Funded by urbanization charges collected

from significant developments near metropolitan hubs, primarily in central municipalities, this fund distributes resources with an emphasis on territorial equity. These programs not only support urban regeneration in socially, demographically, and economically fragile areas but also promote a more cohesive development across the metropolitan territory.

On the other side of the world, the Marmara Region, home to over 26 million people—one-third of Türkiye's population—displays a dynamic mix of urban complexity and interconnectivity. This region's response to climate crises and natural disasters is managed by the Marmara Municipalities Union (MMU), which includes over 190 member municipalities from 11 cities. The MMU employs a multifaceted approach to enhance urban resilience, incorporating the Local Government Academy, five specialized Centers, the Mentor Program, and initiatives like the Marmara Urban Forum (MARUF). Using these tools, MMU addresses the critical need for inter-city collaboration across the region to effectively confront and adapt to shared challenges.

Together, these case studies from Bologna and Marmara demonstrate proactive steps towards fostering urban resilience. They emphasize how strategic financial mechanisms and robust inter-municipal cooperation can create more sustainable and resilient urban environments. Drawing inspiration from the proverb, 'It takes a village to raise a child,' this presentation adapts it to urban dynamics, proposing that 'It takes a metropolis, and sometimes even a megalopolis, to become resilient.' This underscores the collaborative efforts needed to address the complexities of urban development in an era of growing planetary challenges.

Spatial Planning and Metropolitan Governance to face flood risk in the new Climate Change context: A comparison between Eurodelta Megaregion and Valencia metropolitan area

Authors: Joaquín Farinós Dasí¹; Moneyba Gonzalez-Medina²; Alankrita Sarkar³

¹ *University of Valencia*

² *Universidad Autónoma de Madrid*

³ *Delft University of Technology*

Corresponding Authors: joaquin.farinós@uv.es, moneyba.gonzalez@uam.es, alankrita.sarkar@deltametropool.nl

Spatial planning at metropolitan level is an important basis in order to make steps forward to an appropriate metropolitan governance as soft spaces, despite non-formalized metropolitan governments. That is asking for collaborative, interscalar approaches to address complex challenges, redefining governance and planning practices beyond traditional administrative boundaries. This presentation, based in a comparative approach between two case studies (Eurodelta metropolis and euroregion, and Valencian metropolitan area) will emphasise on innovative planning procedures research by design approaches, frameworks for shared knowledge and exchange, fostering an interplay across scales and sectors. Both The Netherlands (in past 2010 decade) and Valencia region (more recently in past october 2024) has heavily suffered effects of floods due extraordinary rainfalls intensified by the Climate Change, causing very important damages at personal, economic, facilities and infrastructural levels. If climate adaptation measures as well as the issue of resilience in decision-making

are not included in the planning of area developments, sooner or later these projects will be unviable; more particularly in low-lying areas with geomorphological risk. The compliance with planning, the knowledge of protocols and the coordination between actors will be some of the factors that will be evaluated.

The objective is to highlight the need to strength a territorial culture and to develop institutional capacity to respond in a coordinated manner to these phenomena at metropolitan scale. By shifting the focus toward the changing roles of designers and planners, the presentation aims to spark a dialogue on innovative approaches to resilience. How can planning evolve to navigate the complexities of climate transitions and ensure equitable outcomes? What new methods and collaborations are needed to create adaptable, future-proof megaregions? This dialogue seeks to exchange knowledge and ideas across disciplines and regions, advancing the global conversation on crossing borders for resilience and sustainable spatial development.

Planning and Housing Policy: in defence of resilient metropolitan regions

Authors: Sónia Alves¹; Valeria Fedeli²

¹ ARL –Academy for Territorial Development in the Leibniz Association

² Politecnico di Milano

Corresponding Authors: sonia.alves@ics.ulisboa.pt, valeria.fedeli@polimi.it

Over the last decade the affordability of housing has become a major policy issue and increasingly a concern for governments as house prices have risen dramatically with respect to wages. Whilst land is limited in supply and fixed in space, the quantity of credit and investment has expanded over time. The high liquidity has driven property prices at a much faster rate than rises in incomes, making housing increasingly unaffordable for a large proportion of the population. In various metropolitan contexts, the growing awareness of housing's multifaceted impact on social, economic and environmental systems has led to its recognition as a key governance issue to foster resilience. Based on evidence from case studies and fed from the activities of ARL working group, this contribution is based upon a dialogue between the authors that aims at contributing to the debate of:

- whether there is effective metropolitan-scale governance on this policy issue
- how legal and financial instruments can help to foster effective planning policies and practices for affordable housing.
- How solutions and tools adopted are inspired by a proactive conceptualisation of resilience and how the metropolitan dimension is key to this approach

Lisbon's Urban Nature Imaginaries: rethinking values and meanings for a more inclusive urban transformation

Author: Andresa Ledo Marques¹

Co-authors: Fiona Kinniburgh¹; Olivia Bina

¹ *University of Lisbon*

Corresponding Authors: andresa.marques@ics.ulisboa.pt, bina@edu.ulisboa.pt, fiona.kinniburgh@ics.ulisboa.pt

Urban areas are emerging as central arenas for strategies to tackle global challenges in the context of interconnected climatic, ecological and social crises. One of the responses to these multiple challenges has been the integration of nature into cities, increasingly promoted in urban planning based on concepts such as Nature-based Solutions (NbS). However, despite the growing endorsement of so-called green agendas within urban policies, there is a gap in understanding which and whose values and meanings of nature are being mobilized or excluded in imaginaries related to urban nature, raising questions about the imaginaries that underpin such concepts and their implications for urban transformations. This presentation, part of the “Naturescapes” project, investigates the official imaginaries - visions and narratives about desirable futures evoked in urban policy documents such as strategic plans, master plans, foresight studies and sustainability strategies - that shape institutional perspectives on nature and human-environment relations. We argue that these imaginaries, in addition to reflecting epistemic and power dynamics, have the potential to catalyze innovations in urban planning by allowing policymakers to imagine future possibilities and respond to evolving values, including nature's cultural and intrinsic services. The study examines the evolution of these imaginaries at different planning scales over the last two decades in Lisbon's Functional Urban Areas (FUA). Through semi-structured interviews, field visits, and documentary analysis, we explore which values of nature are being included or excluded, how these imaginaries have evolved over time, and how they can promote transformative changes in human-nature relations, pointing to pathways for more inclusive urban planning.

SS_07 TURNING NATURE-BASED SOLUTIONS INTO INCLUSIVE CLIMATE ACTIONS / 2066

An intersectional urban care framework for evaluating Nature-based Solutions

Author: Danielle MacCarthy¹

¹ *University of Amsterdam*

Corresponding Author: d.a.maccarthy@uva.nl

NbS are hailed for their multiple benefits and their effectiveness to alleviate and respond to the risks presented by climate change. Yet, scholarship increasingly challenges NBSs underlying principles and values, highlighting that those who most need the benefits of NbS, often are not in receipt of them. Consequently, NBS practice has been critiqued for failing to engage with existing inequities and in some cases, reproduces inequalities through NbS practice. In this presentation, I outline a novel intersectional framework

which builds on climate justice and urban care frameworks to empirically examine four key dimensions; spatial and material factors, social and network relationships, place based climate adaptation and cross identity climate action with cross cutting themes of intersectionality and more-than-human in Amsterdam, Brussels and Bucharest. We employ abductive methods to enable person derived variables of vulnerability, that are then ranked using Q-sort methodology and lastly, we carry out a weighted GIS-based socio-spatial hotspot index at a city scale. Through this approach we intend to derive new co-created assemblages of data that recharacterize the impacts of NbS on multiply marginalized people and more-than humans and reflect their lived experiences of vulnerabilities in relation to NbS and climate adaption. Moreover, we intentionally engage with the theoretical paradoxes of intersectionality that seek to avoid reinforcement of inequalities through homogenized conceptions of vulnerability, but instead point to the relational power structures and lack of urban care regimes that create uneven impacts to communities and multispecies environments that are subjected to increased vulnerabilities.

Literature review on inclusive Nature-based Solutions in Europe

Author: Constantina-Alina Hossu¹

Co-authors: Mihai-Razvan Nita ¹; Ioan-Cristian Ioja ¹; Cristina-Gabriela Mitincu ¹; Maria-Alexandra Calota ¹

¹ *University of Bucharest, CCMESI, Romania*

Nature-based Solutions (NbS) provide ecological, socio-cultural and economic benefits. However, in several cases they are less effective at performing such benefits, bringing inequalities and injustices in cities, such as access to NbS services, displacement through green gentrification, or lack of community participation. To deepen the concept of inclusive NbS we conducted a systematic review of 280 academic publications, centred on European urban regions. We explored the definition and criteria for inclusive NbS and used network analysis to group their associated barriers and enablers. Our findings reveal that in order to design inclusive NbS, it is essential to engage and properly address the urban residents'needs, requirements, and values. This could further minimise green gentrification and unequal distribution of NbS benefits (among the most important barriers) and enhance co-creation and accessibility to NbS for all, including vulnerable groups (among most important enablers). We further discuss lessons that can be learned from case studies where NbS inclusivity is at risk as well as where it is practiced at higher levels.

inclusive; nature-based solutions; justice; review; Europe

SS_07 TURNING NATURE-BASED SOLUTIONS INTO INCLUSIVE CLIMATE ACTIONS / 1954

Assessing the effectiveness of Nature-based Solutions as Inclusive Climate Actions: a case study from Torino, Italy

Authors: Sara Torabi Moghadam¹; Virginia Pellerey¹

¹ *Politecnico di Torino*

Corresponding Authors: sara.torabi@polito.it, virginia.pellerey@polito.it

Nature-based Solutions (NBS) are recognized as strategies for climate change mitigation and adaptation. However, while existing assessment frameworks focus on the environmental impacts of NBS, they usually neglect their relevant implications on social and economic issues. Instead, a more comprehensive approach might also reveal the vital role of NBS as Inclusive Climate Actions (ICAs): strategies that promote participation, inclusivity and justice along with the achievement of climate adaptation and climate resilience. This study details the empirical implementation of a Monitoring and Evaluation (M&E) framework designed to assess environmental, social, and economic impacts of NBS as ICAs. The framework is composed of 12 Key Performance Indicators (KPIs) and 8 supporting place-based indicators. The M&E framework is implemented in four different NBS projects in the city of Torino (Italy). For each indicator, a specific methodology is defined from and analysis of existing and peer-reviewed literature. Methodologies for the 20 indicators include interviews, questionnaires, spatial analysis, and economic modelling. Results of each indicator are then normalized for comparison between different projects within the city of Torino. Finally, results are discussed with the intent of highlighting synergies and trade-offs between the observed impacts. The findings highlight the relevance of NBS as ICAs. While the detected economic and environmental impacts are minimal due to the small dimensions of the projects, results place specific emphasis on the effectiveness of NBS in improving perceived well-being, participation, community engagement, and environmental education. Moreover, this work underscores the importance and possibilities of replication of the comprehensive M&E framework employed, and validates the methodologies proposed for the assessment of each indicator. By centering people at the hearth of the analysis of NBS, results of this research mark a starting point in making NBS inclusive strategies for fostering sustainable and just cities. Moreover, results contribute with actionable insights for policymakers and practitioners who aim to design and implement ICAs. This work is part of the European project GREEN-INC: growing effective and equitable nature-based solutions through inclusive climate actions.

How equitable and inclusive is the green space strategic planning in Romania?

Author: Diana Andreea Onose¹

Co-authors: Simona R. Gradinaru²; Andreea Raluca Slave¹; Ana Maria Popa¹

¹ *University of Bucharest*

² *Swiss Federal Research Institute WSL*

Corresponding Authors: andreea.slave@drd.unibuc.ro, anamaria.popa@geo.unibuc.ro, dianaan-dreea.onose@g.unibuc.ro, simona.gradinaru@wsl.ch

Equity and inclusiveness are two of the main goals of sustainable urban development, which help achieving resilient cities. The elements of urban green infrastructure, comprising green spaces and nature-based solutions, represent an important tool for creating sustainable and resilient cities. The inclusion of equity aspects related to urban green infrastructure in strategic urban planning documents should increase the pace of

their implementation.

The analysis explores if and how equity is discussed by strategic planning documents in Romania in relation to urban green infrastructure planning. The analysis is comprised by 2 steps: (1) we used around 240 urban strategic plans to investigate which aspects of environmental justice (availability, accessibility, attractiveness, safety, walkability, and affordability) are discussed in relation to urban green spaces and which vulnerable groups (e.g. children, elderly, youth, sick people) represent a priority in planning and (2) we focused on a sample of 18 cities for which 3 generations of strategic plans were available and analyzed the potential changes in urban green space management using a framework centered on five dimensions related to the quality of the plans - communication-oriented, evidence-based, collaborative, adaptive and action-oriented aspects.

The results highlights that the most discussed aspects in strategic urban planning documents in Romania in relation to urban green spaces are those related to availability and attractiveness and the most targeted vulnerable group is represented by children. There is a small increase of the documents quality over time in relation to the way in which green spaces are planned and equity and inclusiveness aspects addressed.

Modern, Restorative, Sustainable? Examining Neo-colonial Urbanism and Commons in the Global South

Author: Cecilia Mercedes Quevedo¹

Co-author: Ailen Suyai Pereyra²

¹ CONICET - Universidad Nacional de Córdoba

² CONICET Córdoba - Universidad Nacional de Córdoba, Argentina

Corresponding Authors: ailen.suyai.pereyra@unc.edu.ar, cecilia.quevedo@unc.edu.ar

Cities in the Global South are experiencing profound processes of urban renewal that, like to capitalism, need to be understood in their inherent dualities and tensions. These processes involve transformations that simultaneously produce and destroy, accumulate and dispossess, and oscillate between dominant narratives and dissident practices. This paper examines three neighbourhoods in the Argentinean cities of Córdoba, Resistencia, and Villa María, where urban development prioritises the production of capitalist value at the expense of diverse ways of life and the conflicts inherent in urban spaces. From a critical perspective, we explore modernisation in the Güemes neighbourhood, historical reparation in the Toba neighbourhood, and sustainability in the Ecobarrio, Villa María. Using a qualitative approach, we analyse the different characteristics of the urban transformations in each case through three dimensions: (a) neo-colonial urbanism as a manifestation of capital's influence under varying socio-historical conditions; (b) political discourses where the state assumes diverse hegemonic roles to legitimise neighbourhood interventions; and (c) the production of urban commons as an everyday resistance tactic used by the inhabitants of the Global South. By critically engaging with these dimensions, we aim to deepen understanding of how urban renewal unfolds and is challenged in intermediate cities.

Decolonial Strategies for Urban Greenery –Initiating Change in Urban Landscapes

Author: Meeri Pitkänen^{None}

Co-authors: Saija H. Hollmén ; Alexander B. Marful ; Taru Niskanen ; Daniel Y. A. Duah ; Esmeranda Manful ; Irene A. Idun

Corresponding Author: meeri.pitkanen@aalto.fi

Environmental degradation is a severe challenge in the rapidly expanding cities in the Global South. Amidst the uncontrolled urban growth in low- and middle-income countries, a tendency prevails to follow the same environmentally destructive pathways and mindsets that the wealthier colonial powers have laid out in the past. The greatest obstacle is the mindset of contemporary societies: lack of environmental awareness, and the continuous exploitation of both natural and human resources. For sustainable urban planning, avoiding colonial practices requires new approaches that raise awareness and local appreciation of the environment as an intrinsic cultural value, and support cultural resilience against external abuse.

This paper debates decolonial approaches for landscape architecture and urban planning to promote a balanced human-nature relationship and create new tools for Sustainability Transition in Sub-Saharan Africa. It investigates a case study named Kumasi Trees -Project of the Hearts, which aims at re-greening the Ashanti capital of Kumasi in Ghana, by evoking local engagement and ownership and exploring local knowledge as a means for decolonisation to rediscover environmental values and cultural identities.

The study draws upon cultural ecology as its theoretical framework to examine the impact of rapid urban expansion on urban green spaces, local resilience, and cultural identity. Adopting a decolonial approach, the research employs indigenous local knowledge (ILK) and cultural narratives to facilitate community-based ecological restoration and enhance environmental awareness. To gain a comprehensive understanding of the cultural context of the urban landscape in Kumasi, the study employs an archival study and ethnographic fieldwork. Subsequently, action research and participatory methods are employed to facilitate community engagement, with the objective of linking climate adaptation initiatives with the strengthening of cultural identity in the urban landscape.

The paper reflects practices of engagement in the framework of Decolonial Thought (DT), questioning the universality of Eurocentric thinking. It acknowledges multiple value systems and adopts alternative knowledge bases stemming from other cultures, particularly those in Sub-Saharan Africa. The research contributes to the discourse on landscape architecture, urban planning and ILK by advocating for place-based, culturally sensitive design solutions as a decolonial framework for sustainable urban development.

Beyond Erasure: Alternative Understandings of Colonial Legacies in Urban and Rural Spaces

Author: Kundani Makakavhule¹

¹ *University Of Pretoria*

Corresponding Author: kundani.makakavhule@up.ac.za

Colonial histories persist in contemporary urban and rural landscapes through processes of erasure, resistance, and re-imagining. This presentation examines case studies from several countries in the Global South. Cases from Mumbai, Argentina, Ecuador, Malaysia, and South Africa, reveal how communities contest the ongoing entanglements between coloniality and contemporary spatial transformations. Through oral histories, ethnographic insights, and spatial analysis, these cases uncover how infrastructure projects in Mumbai displace fisherwomen, undermining their traditional livelihoods. In Ecuador, urban resignification emerges as a strategy to reclaim colonial spaces, where communities actively resist state-led homogenization. In Argentina, contested urban commons expose the friction between neoliberal real estate development and the persistence of colonial power structures. Meanwhile, Kuala Lumpur's urban governance in Malaysia still reflects British colonial logic, deepening contemporary spatial injustices. In South Africa, the concept of (s)place offers a transformative framework to heal cognitive injustices, reintegrating and revaluing indigenous knowledge into rural development. These insights contribute to the global decolonial movement by highlighting how spatial struggles reflect broader fights for epistemic justice and self-determination. By centring local agency and alternative narratives, this presentation advocates for a decolonial praxis that dismantles colonial hierarchies, fosters community-led planning, and reclaims spaces as sites of resistance, belonging, and cultural continuity.

This presentation focuses on how digital tools can support cities in achieving carbon neutrality by providing smarter decision-making frameworks. Using examples from the UP2030 project in Istanbul's Kadıköy district, it highlights tools like “Urban Building Energy Modeling (UBEM) and Urban Building Transport Energy Modeling (UBTEM): AI-based Digital Decisionmaking Tool for Decarbonization”. These tools use AI, GIS, and optimization techniques to make urban systems including buildings and transport more energy-efficient, reduce emissions, and improve overall comfort.

A critical aspect of achieving meaningful, sustainable strategies is the development of digital tools that can support urban decision-making processes by analyzing the impact of decarbonization strategies on cities. These tools should be designed to integrate climate change considerations into strategic planning and provide decision-makers with a means to evaluate the effects of different mitigation and adaptation measures considering different aspects, including energy consumption, related CO₂ emissions, and economic considerations. Moreover, the integration of digital tools with decision-making processes should be strengthened, ensuring that they are developed with interdisciplinary research findings that bring together expertise from various fields to support urban governance.

In addition to digital solutions, the implementation of tangible urban interventions—such as renewable-energy integrated urban furniture—can serve as a means to raise awareness and foster engagement with decarbonization strategies at the local level as a platform of digital tools. These integrated approaches not only enhance climate governance but also contribute to embedding climate action within the urban fabric in a way that is both visible and actionable.

We'll discuss all of these while also addressing social dimensions such as equity and governance. Insights from a recent workshop in Istanbul will highlight how community engagement, practical awareness campaigns, and policy incentives can empower local residents to adopt sustainable practices.

The aim is to demonstrate how cities can integrate technology with community-driven approaches, ensuring that decarbonization efforts are not only data-informed but also socially inclusive and contextually relevant. This work bridges technical innovation with local needs, offering a holistic perspective on urban decarbonization.

Accounting beyond boundaries: Exploring consumption-based carbon approaches in Paris and Gothenburg

Author: Eloise Deshayes¹

Co-author: Will Brown²

¹ *Universitat Internacional de Catalunya*

² *University of Cambridge*

Corresponding Authors: wghb2@cam.ac.uk, edeshayes@uic.es

As cities increasingly commit to achieving carbon neutrality, they engage in greenhouse gas (GHG) inventories to measure their emissions. These inventories are guided by international frameworks, such as the Global Protocol for Community-Scale Greenhouse Gas Emission Inventories (GPC) and primarily rely on production-based carbon accounting (PBCA).

However, growing claims, both from the literature and policy circles, highlight the limitations of PBCA, emphasizing that it captures only a partial view of urban emissions. Consumption-based carbon accounting (CBCA) addresses this gap by considering embedded emissions in goods and services consumed within cities. This is particularly important in European and Northern American cities, where production-based emissions are declining while consumption-based emissions are projected to increase. Overall, CBCA is considered to offer a more comprehensive and equitable framework for addressing urban GHG emissions, incentivizing the adoption of policies that promote less carbon-intensive consumption.

Despite its promise, CBCA presents challenges, particularly in governance and implementation. However, existing studies predominantly address methodological issues, such as data collection and calculation techniques, while the political and governance dimensions at the city level remain underexplored. This study bridges that gap by investigating the governance conditions necessary for CBCA implementation, using Paris and Gothenburg as case studies. Both cities are leaders in this area, having established ambitious targets for consumption-based emissions reduction. The research employs a mixed-method approach, analyzing city documents, conducting interviews with officials, and integrating desk research to uncover key drivers of CBCA adoption.

This presentation will expose the results of that research, highlighting the governance and political factors necessary for developing CBCA in cities. It will offer insights and best practices that can inform the development of CBCA approaches in cities and support global climate networks.

SS_09 GOVERNING THE “CARBON NEUTRAL CITY”: BARRIERS AND ENABLERS FOR AN INTEGRATED CLIMATE GOVERNANCE IN CITIES / 1988

Exploring the feasibility of climate actions: what guides adaptation implementation in Europe?

Author: Gerard Martínez Görbig¹

Co-authors: Johannes Flacke ¹; Richard Sliuzas ¹; Aldo Treville ²; Diana Reckien ¹

European cities are reacting to the climate crisis. Climate planning has exponentially increased in recent years, but a gap remains between planning and implementing climate actions. While many cities and regions have outlined ambitious strategies, far fewer have turned these plans into tangible results. There is a need to act faster to keep global warming within 2°C, addressing mitigation and adaptation challenges. Thus, analysing the feasibility of climate actions (e.g., their potential to be implemented) becomes crucial.

However, some might argue that feasibility is no longer solely about implementation but should include the capability to reach climate goals in time and be implemented fairly. The feasibility of climate actions depends on a combination of factors. First, context is critical. Economic conditions, social dynamics, governance systems, and legislative frameworks all influence whether an action can succeed. For example, regions with stronger adaptation laws often make more progress in planning and implementing actions. However, even in these regions, changing conditions—such as shifts in political leadership or global crises—can alter what is feasible over time. Second, the role of stakeholders is essential. Feasibility depends on clear responsibilities, adequate resources, and meaningful engagement with all affected groups. A lack of clarity about who is responsible for implementation, funding, or monitoring can derail even the most promising projects. Furthermore, failing to involve vulnerable groups or address justice issues can lead to inequitable or counterproductive actions.

Time also plays a crucial role here. Actions need to be evaluated not only for their immediate feasibility but also for their long-term impact. Planning, implementation, and monitoring are interconnected, and decisions made at any stage can influence outcomes later. Solutions to close such gaps remain between empirical data. Exploring reported data from international initiatives such as the Covenant of Mayors without proper monitoring and contrasting it with detailed information about particular implementation processes reveals important information for the science community and practitioners, which can contribute to closing the gap between planning and implementation.

This session will explore the results obtained after analysing the European adaptation actions reported in the latest dataset released by the Global Covenant of Mayors. Spatial and inferential statistics have been used to identify potential socio-economic and agency-related factors that influence climate action implementation. The results are meant to clarify how such factors can increase the feasibility of actions and identify potential best practices and relevant patterns that can guide the decision-making process.

Urban Carbon Emission Data

Author: Will Brown¹

¹ *University of Cambridge*

Corresponding Author: wghb2@cam.ac.uk

Cities across the globe are actively working to reduce their carbon footprint, with a common approach being the development of neighbourhood and district level pilots. However, whilst such interventions are well meaning and grounded in a will to reduce the city's carbon impact, the data to validate and inform such approaches is often lacking. To this end, many cities rely upon city-wide carbon emission datasets, downscaled from national emission inventories, which lack the granularity to support such pilots. Here a misalignment of data and context is present, resulting in the emission impacts of such neighbourhood level projects as being unquantifiable. This presentation serves to highlight approaches to closing this gap between carbon emission data and practices centred around reducing emissions within decarbonisation projects and the city as a whole. This is initially structured around outlining the current state of carbon accounting within European cities, and the data available to practitioners and decision makers, before expanding into the cutting edge of urban carbon accounting currently being conducted within academia. Here the concept of urban carbon emission data maturity is discussed, outlining the prerequisite resources, capacities and data availability required for city authorities to conduct more advanced carbon accounting.

ASSETs for circular futures: boosting the transition to circular construction in the Eurodelta

Author: Fabio Bayro Kaiser¹

Co-authors: Christa Reicher¹; Alexander Wandl²; Dagmar Keim³

The ASSET project—A Spatial Strategy for Eurodelta, boosting the Transition to circular construction—is a transformative initiative to establish the Eurodelta as a blueprint for a circular built environment (CBE). ASSET is a collaborative project between the cities of Amsterdam, The Hague, Brussels, Krefeld, and Duisburg; RWTH Aachen and TU Delt universities; and the Deltametropolis Association and Metrex. The Eurodelta encompasses diverse urban regions such as the Randstad, Brussels, and Rhine-Ruhr, and it faces challenges of climate adaptation, biodiversity loss, and socio-economic inequalities, among others. ASSET uses shared infrastructure and economic networks to develop spatial strategies for a CBE. Early efforts, including material flow mapping and cross-regional collaboration, have identified circular construction hubs and reuse practices, and showcased scalable solutions that combine local innovation with regional coordination.

ASSET emphasises the importance of bridging visioning and implementation by integrating bottom-up innovation and top-down coordination. Through participatory practices, multi-stakeholder workshops engage municipalities, private companies, practitioners and communities in co-creating actionable design principles that reflect local needs and aspirations. These processes ensure alignment with long-term regional strategies, while maintaining a focus on place-based policy-making to address local specificities. Collaborative student-led design initiatives further enrich the process, combining grassroots creativity with structured governance to foster shared narratives that prioritise ecological balance and social equity.

By integrating local action with overarching coordination, ASSET illustrates a paradigm shift towards a place-based circular economy. It redefines land use, logistics, and governance to achieve regenerative material flows and adaptive urban systems. Thereby, positioning the Eurodelta as a global model for sustainable transformation, and demonstrating how collaboration at all levels can shape an equitable, resilient urban future.

GIVING OPERATIONALITY TO STRATEGIC PLANNING: FROM THE VISION 2030 TO THE TERRITORIAL PLAN OF THE METROPOLITAN CITY OF FLORENCE

Authors: Giuseppe De Luca¹; Valeria Lingua²

¹ *University of Study in Florence*

² *University of Florence, Department of Architecture*

Corresponding Authors: giuseppe.deluca@unifi.it, valeria.lingua@unifi.it

The contribution reflects on the way to give operability to strategic plan, by describing the path from the definition of the strategic metropolitan plan (SMP) and its implementation through operational projects that are the base of the territorial metropolitan plan (TMP) of the metropolitan City of Florence.

The SMP has provided to connect places with strategic development directions, providing with a visioning process able to define, select and make sense of the complex reality of the metropolitan city and its positioning into the global context. In such a complex framework, the making of the strategic metropolitan plan (PSM) has been conducted as a creative regional design practice for framing the urban region and envisioning its possible future development. By using spatial representations and shared visions, the debate has raised on physical changes, sharing responsibilities and resources. In the implementation phase, this process has conveyed to conceive a multi-level and trans-scalar approach to local projects, conceived as part of the integrated visions of the SMP. With the TMP, the Metropolitan City of Florence has embarked on an institutional experimentation aimed at simplifying the metropolitan planning, drawing up a Metropolitan Territorial Plan (PTM) With a form and nature that make it more in line with the social and economic conditions of our time.

The TMP of Florence is structured as an instrument for territorialization of the contents of the Metropolitan Strategic Plan, adopting at the same time a dialogic and cooperative approach, therefore not imposing on the municipalities, but rather governance made of soft power, multi sectoral and multi scalar instrument to guide the multiple directions of change. The PTM is divided into three main components: the Knowledge Framework, the Statute and the Proposals Framework which, organized in Strategies and Meta-projects, has the objective of serving as a grid to identify, first, and then define, some design solutions of “issues”subways.

UNDERSTANDING THE ROLE OF WATER DATA SPACE IMAGINARIES IN ACCELERATING TWIN (GREEN AND DIGITAL) TRANSITION PATHWAYS FOR THE WATER MULTIVERSE

Author: Chiara Farné Fratini¹

Co-author: Peter Steen Mikkelsen ¹

¹ *DTU Sustain, Technical University of Denmark*

Corresponding Authors: chif@dtu.dk, psmi@dtu.dk

Europe is at the heart of a digital revolution affecting almost every domain of the economy, policies and citizens' lifestyles in general. The Covid-19 pandemic has accelerated the digital transformation unveiling at the same time important challenges characterizing this socio-technical transformation: 1) it has exposed society's vulnerability to new digital divides, 2) it demonstrated that there are wide variations in digital transformation advances between Member States, and 3) it highlighted the European Union's dependency on non-EU digital players and platforms (Negreiro 2022). On these premises, the European Parliament have launched the 2030 Policy Programme 'Path to the Digital Decade' to reinforce digital sovereignty and to ensure strategic autonomy, ensuring that the digital transformation will promote EU values and respect fundamental freedoms. The final goal is "to boost Europe's global competitiveness and further the digitalization of European industry, which still lags behind, particularly in [SMEs]" (Negreiro 2022). An important pillar of this policy programme is the intention to build a fair and sustainable data economy for Europe. One of the key conceptual foundations of this policy package is the creation of common European data spaces. This focus derived from the awareness that, despite the exponential growth of data produced and the value potential they bear for society and the economy, the use of this data is suboptimal and therefore its value is not fully exploited. There are multiple reasons for this but the most critical are: 1) lack of trust between data providers and data users; 2) data protection and regulatory aspects, 3) limited accessibility and availability of data (Otto, ten Hompel, and Wrobel 2022b).

This is the context in which the "Water Data Space" project was funded. The purpose of this project is for the water sector, in collaboration with universities and SMEs, to "establish an open data space that can systematically facilitate the complex task of collecting, organizing and displaying data from multiple data sources, so that it is possible for a large diversity of actors to develop new knowledge and business models for the innovation of the water sector". Our role within this project is to study how and if the emergence of sustainability transition pathways within the water sector can be facilitated and supported through the sharing of data, when this data sharing is made possible by means of innovative, open and accessible "water data spaces". An evidence-based approach seeks to document the knowledge co-production of emerging water data space imaginaries within this project to become a reference point for further initiatives nationally and internationally. The results from this study will provide the basis for a broader involvement of actors with the capacities needed to support the establishment of those transformational imaginaries bearing potentials for the acceleration of the twin (digital and green) transitions in Europe and beyond.

SS_10 SHAPING REGIONAL FUTURES TOWARD SUSTAINABLE TRANSITIONS: COMMUNITY INVOLVEMENT IN VISIONING AND IMPLEMENTATION / 2070

Enacting Istanbul Vision 2050: Addressing Key Urban Challenges Through Participatory and Multi-Scale Planning

Author: MÜGE YORGANCI OZAR¹

¹ *ISTANBUL PLANNING AGENCY*

Corresponding Author: mugeyorganci@gmail.com

Climate change, biodiversity loss, and deepening socio-economic inequalities are global crises that increasingly compel urban governments to adopt transformative planning actions. Istanbul, significantly impacted by these challenges, also possesses unique potential for generating sustainable solutions. The city is distinguished by its rich historical context, multi-layered natural and cultural heritage, strategic economic role in Turkey, and dynamic metropolitan characteristics. However, the economic, ecological, and social costs associated with centralised decision-making, predominantly imposed by the central government, pose serious risks. Large-scale infrastructure projects and top-down spatial interventions not aligned with urban plans threaten Istanbul's urban landscape, presenting a significant challenge for local government and communities.

Istanbul is also the focus of demands for urban democracy and participation. The need for spatial decisions that are developed with participatory governance and provide equal opportunities to residents is directly related to the democratic functioning of the public sphere and the protection of freedom of expression (Istanbul Planning Agency - Vision 2050 Office, 2020).

Developing a shared urban vision between local municipalities and residents to establish a roadmap has become essential for urban governance. To steer Istanbul towards a resilient, inclusive, and sustainable future, the Istanbul Planning Agency (IPA) was established in 2020, resulting in the development of the Istanbul Vision 2050 Strategic Document (2022) and the Vision 2050 Action Plan (2024), which delineate the city's key strategic actions.

The Istanbul Vision 2050 Strategic Document and Vision 2050 Action Plan emphasise the need for a new planning paradigm in response to ongoing local and global transformations. Accordingly, rather than static policy documents or action plans, they are conceived as dynamic, continuously negotiated, and adaptable governance frameworks. The governance and democracy components shape the targets defined in the Vision, providing a foundation for decision-making processes. While the metropolitan municipality is responsible for steering Istanbul towards these objectives, implementing the proposed actions relies on collaboration with other public institutions, civil society organisations, and experts.

Civic engagement is central to developing and implementing these plans and to the broader future vision set by the Istanbul Vision 2050 Strategic Document and Action Plan. Accordingly, the Vision 2050 Action Plan defines numerous objectives and actions focused on participatory governance. Democratising urban life in Istanbul involves stimulating active citizenship and enabling residents to participate in urban policymaking. The plan proposes mechanisms and platforms for collaboration between civil society and local authorities in areas such as environmental sustainability, spatial planning, and cultural heritage. This approach prioritises decision-making processes that include residents, ensuring community involvement in shaping policies that directly affect urban life. Moreover, involving civil society and Istanbul residents in decision-making and implementation processes concerning urban services will contribute to making these services more inclusive, spatially just, and accessible, thereby reinforcing the city's resilience goals.

Improving the governance of urban commons based on the right to the city will strengthen solidarity among community networks and enhance residents' sense of belonging. This, in turn, will contribute to achieving the spatial objectives outlined in the Vision. Furthermore, civil society and individuals will actively engage in decision-making through participatory spatial planning and mechanisms defined within the Action Plan. Community participation will be strengthened through a resilience-focused governance model, starting at the neighbourhood level.

The established action areas, policies, and projects have emerged from a participatory approach, engaging pertinent institutions and societal stakeholders in the development process. Thus, the Action Plan is envisioned as a dynamic and continuously evolving roadmap. The next step involves creating a comprehensive spatial framework for Istanbul, aligning the new Istanbul Environmental Master Plan with key transformative projects outlined in the Vision 2050 Action Plan and their spatial implications.

SS_10 SHAPING REGIONAL FUTURES TOWARD SUSTAINABLE TRANSITIONS: COMMUNITY INVOLVEMENT IN VISIONING AND IMPLEMENTATION / 1969

Navigating Lusatia's Structural Transition Between Consensus and Dissensus

Authors: Tihomir Viderman¹; Silke Weidner¹; Rafael Maximiliano Flores de Leon²

¹ *BTU Cottbus-Senftenberg*

² *BTU Cottbus Senftenberg*

Corresponding Authors: floreraf@b-tu.de, viderman@b-tu.de, weidner@b-tu.de

The structural transition in Lusatia, Germany, prompted by the national coal phase-out, exemplifies the complex interplay between technocratic governance and divergent public narratives. Despite sustained economic stability, bolstered by job creation and infrastructure improvements, public sentiment often remains tied to the decline of the region's energy-intensive industries. Stories that make headlines tend to depict an unsettled, dissatisfied population and an urban environment resistant to change and wary of difference.

In view of the contingencies surrounding Lusatia's transition, the national Structural Strengthening Investment Program aims at establishing governance structures that bind various levels of decision making from national to local, which support projects aiming to stage a new aesthetics of transition through flagship structural projects and massive landscape restorations. This multilevel governance approach relies on consensus-driven, technocratic strategies that emphasize compromise and managerial coordination. Such depoliticization tends to be critiqued in social sciences for replacing adversarial politics and stifling radical new imaginaries. However, Lusatia's case reveals a different dynamic, in which dissent is driven by radical-right polarization, which capitalizes on narratives of exclusion, economic insecurity, and cultural fears, thus creating a complex ethical and political landscape that defies conventional categorizations of the post-political condition.

Drawing on qualitative data from document analysis, stakeholder interviews and focus groups, this study identifies three pathways regional governance structures use to address the challenges of aligning structural policy with regional aspirations. First, counteracting radicalization through accessibility focuses on demystifying the complex lexicon of sustainability transitions and emphasizing equitable outcomes. While the stakeholders underscore the importance of transparent, relatable policies, the emphasis on consensus can paradoxically fuel polarization as the voices that feel left on the other side of environmental justice are picked up and mobilized by populist movements. Second, depoliticizing transition through evidence-based governance prioritizes common interest for a coal phase-out aligning particular interests of mainstream political parties with interests of consensus-driven governance structures, which seek to address dissent by presenting decisions as apolitical and inevitable. Third, public participation is recognized as a mitigative tool for marginalizing radical-right narratives. Stakeholders advocate for an inclusive framework that foster consensus and actively engage publics across plural differences, yet at the operational level they agree there is still much room for enhancing active and direct public involvement.

This research reimagines technocratic governance as both a stabilizing force and a potential source of alienation, offering lessons for managing structural transitions in polarized contexts. By addressing the interplay between consensus-driven governance and dissensus rooted in radical-right polarization, this paper offers insights into balancing technocratic efficiency with inclusive participatory practices.

MAPPING COMMUNITY PERSPECTIVES FOR CO-DESIGNING REGIONAL SUSTAINABILITY TRANSITIONS

Author: Anca Ioana Forgaci¹

Co-author: Verena Balz¹

¹ *Delft University of Technology*

Corresponding Authors: v.e.balz@tudelft.nl, a.i.forgaci@tudelft.nl

For sustainability transition policies and plans to succeed, they must address territorial specificities and mobilize commitment from communities most vulnerable to transitional challenges. Otherwise, they risk being perceived as creating “winners” and “losers,” eroding trust in governance, increasing resistance to change, and exacerbating polarization and social unrest (COM, 2022). Active and direct involvement of communities is therefore an essential component of EU, national, regional, and local place-based policymaking for just sustainability transitions. However, involving communities in this policymaking is challenging because it is often a technocratic, top-down endeavor with little apparent relevance or meaning for communities.

Against this background, this paper discusses an instrumental approach to revealing the dreams and expectations of the least-engaged communities (LECs) in place-based policymaking in four European regions transitioning from coal and iron mining. The analysis was carried out as part of experimentation with design-led territorial and digital tools in the Horizon Europe project Democratising Just Sustainability Transitions (DUST) in Norrbotten (SE), Stara Zagora (BG), Katowice (PL), and Lusatia (DE). Experiments titled Regional Futures Literacy Labs (RFLs) engaged local communities in deliberations on transition policies during four co-design workshops.

The concept of Territorial Capital (TC) provided a framework to trace deliberations, identify regional social-spatial dynamics, inform regional design explorations, and compare community and policy perspectives. The communities’ dreams and expectations were captured through audio recordings, transcribed, and qualitatively analyzed using Atlas.ti software. The coding system was developed using a combined deductive and inductive approach, starting with broad predefined TC categories and gaining depth with specific TC aspects identified inductively in the qualitative data collected from LECs.

This paper presents key findings on the communities’ dreams and expectations vis-à-vis sustainability transition policymaking and explores how these narratives can inform regional designs and community-policy comparisons. The preliminary conclusions of the paper are twofold. First, we draw on the empirical results to discuss how the transition narratives of LECs evolved over the course of the labs and under the influence of various factors. Second, we propose how methods can be refined to enhance community future literacy and support community reflection on regional sustainability transitions. Final conclusions will draw on how the proposed design-led methodology can facilitate policy and community alignment, indicating their potential to better represent LECs’ voices in

shaping policies across diverse regional contexts, fostering inclusive decision-making processes.

In an anthropogenic era marked by recurring environmental and socioeconomic crises and heightened unpredictability, planning regional futures for a sustainable transition has become an increasingly pressing and complex challenge.

In Portugal, however, regional planning has historically been overlooked within the national spatial planning system and public policies. This is largely due to the fact that, while statutory planning within a traditional state framework rooted in nested territorial administrative units and formal tiers of government, regionalization has neither been pursued nor has a regional level of government been established. As a result, regional and supra-municipal policies depend either on central government decision-making or on the voluntary cooperation of local authorities in policymaking and decision. This highlights a significant gap between how power is territorially exercised and the pressing territorial challenges that are emerging, such as climate change adaptation, food production and supply, housing, and socio-territorial inequalities.

To address these challenges, the Metropolitan Area of Lisbon has, in recent years, become a key platform for developing several strategy-oriented soft planning initiatives grounded in multi-level governance arrangements, inter-municipal cooperation, and the active engagement of diverse territorial actors. Despite the difficulties of implementing territorial approaches at a regional scale, these strategies underscore the emergence of a new supra-municipal spatial reasoning aimed at fostering the metropolitan area as a transformative space for collaborative visioning and decision-making.

The Food Transition Strategy in the Lisbon Metropolitan Area (FTS-LMA) exemplifies such initiatives. Encompassing all 18 municipalities of the LMA, it seeks to integrate diverse policies to establish a sustainable and resilient food system at a metropolitan level. This strategy is developed and supported by FoodLink –the Network for Food Transition in the Lisbon Metropolitan Area –a bottom-up collaborative network that acts as an interface for identifying solutions to plan an integrated and intersectoral food system within the regional context of the LMA. Through its Action Plan, the FTS-LMA articulates a shared vision, guidelines, and objectives to be followed by the entities involved.

In this paper, we aim to examine how the transformative agenda of food systems can drive positive transitions in current spatial planning practices. As a voluntary policy instrument and an example of soft planning practice, the FTS-LMA offers an opportunity to foster the emergence of new planning spaces while advancing innovation in planning at the regional level. We seek to explore how this initiative, with its place-based,

territorially sensitive, and integrated approach, can lay the groundwork for supporting collaborative visioning and regional design approaches at the metropolitan scale, while also contributing to reinforcing traditional state-led planning frameworks.

“Co-Visioning” Urban-Rural Futures: Testing a participative and integrated regional planning approach in Germany and China

Authors: Anke Hagemann¹; Lukas Pappert²; Maria Frölich-Kulik³; Sigrun Langner³

¹ *Technische Universität Berlin*

³ *Bauhaus-Universität Weimar*

Corresponding Author: anke.hagemann@tu-berlin.de

Integrating urban-rural linkages into local and regional planning processes can be a key factor in shaping sustainable social, economic and ecological transformation processes. In efforts to advance regenerative supplies of energy, food, or building materials while mitigating climate change and preserving biodiversity, the territories of extended urbanization are becoming a central arena for future innovation. Agile planning approaches, multi-stakeholder platforms and models of integrated regional governance are therefore needed to negotiate and envision urban-rural futures across administrative boundaries and sectoral silos.

The Sino-German Urban-Rural Assembly project (URA, 2019-2025) addressed this methodological gap by conducting transdisciplinary and transformative research in living labs in Germany and China. Based on multidisciplinary analyses of socio-spatial practices, material cycles, water landscapes, ecosystems, migration and inclusion, the project initiated “Urban-Rural Co-Visioning” processes in both regions. In a series of multi-actor workshops, researchers and local stakeholders entered into negotiations on regional futures and co-designed goals, future visions and transformation paths for strengthening sustainable urban-rural relations in the living labs. The aim was firstly to develop evidence-based and locally robust guiding principles for sustainable transformation in both regions, and secondly to derive a transferable methodology for “Co-Visioning” urban-rural regions. The paper will present the refined approach as published in a joint policy paper with UN-Habitat.

Revisiting the art of town planning: what can archives teach us about the pedagogy of design?

Author: Alison McCandlish¹

¹ *University of Glasgow*

Corresponding Author: alison.mccandlish@glasgow.ac.uk

The historical archives of the Royal Town Planning Institute recently digitised by the Hathi Trust cover the period from establishing the Institute through to the 1990's, and offer a rich record of activities undertaken within planning practice from 1914-1993. In this paper I discuss my findings based on a purposive qualitative review of these archives relating to planning education, focusing on how design is treated as a discipline and the pedagogical approaches which drive this.

Throughout the archives there are fascinating opinion pieces, records of conference discussions and advertisements for courses and training. Design is seen as a key component of the "ethical principles governing our perception of the art and science of town planning" (Mawson, 1915, p. 83), and a storyline of the interaction of planning practice, planning education and the related professions against the backdrop of evolving legislation and public opinion is played out in these extensive volumes.

In the paper will also reflect on the problems and benefits in using institutional archives for pedagogical research, where a bit of serendipity and an archigraphic eye (Tamboukou, 2015; Stanley, 2016) definitely come in handy when casting a critical on archival "uncomfortable truths" (Royal Town Planning Institute, 2024).

Finally, I contextualise these insights by looking at how these are relevant in planning and design education today.

SS_11 THE VALUE AND ROLE OF DESIGN IN PLANNING EDUCATION / 2011**Teaching Planning Without Planning Schools: Challenges from Central America****Author:** Karla Barrantes-Chaves¹¹ *University of Costa Rica***Corresponding Author:** karla.barrantes@ucr.ac.cr

Planning education as a field characterised by epistemological diversity integrates disciplines such as social sciences, engineering, architecture and natural sciences. However, in regions without dedicated planning schools—such as universities in Central America—planning is often taught as a module within undergraduate or postgraduate programs in engineering or architecture. Consequently, planning departments in public institutions and local governments, such as those in Costa Rica, are often led by architects or engineers who lack formal training in planning; although urban design is a subject learned by architects, design-related skills are not necessarily the main focus of engineering programs. This situation raises two critical questions: How can planning be effectively taught without dedicated planning schools? Moreover, how can design concepts be tailored to students with diverse educational backgrounds?

This paper briefly overviews universities' programmes offering modules of planning and urban design in Central America. Using an example from the University of Costa Rica, it examines teaching techniques applied in a planning module offered to students from the Surveying Engineering School between July and December 2024; they aimed to introduce basic design concepts and planning principles. This work takes on the challenge of teaching basic design concepts so that, if these students oversee planning offices in the future, they can collaborate effectively with design professionals. The teaching strategies employed included a mix of digital and in-person gamification, field trips and role-playing exercises based on case studies. Classroom assessment techniques were used to evaluate the effectiveness of these methods in helping students achieve learning objectives. The findings suggest that students preferred field trips over other teaching methods to understand basic design concepts. Digital gamification was also highly successful, especially when students were involved in the game's design and shared it with their peers. Finally, the article reflects on the broader challenges of teaching planning when it is not the central focus of a degree program. It highlights the urgent need for deeper reflection and innovation in planning education to address the pressing urban challenges faced by Central American cities.

SS_11 THE VALUE AND ROLE OF DESIGN IN PLANNING EDUCATION / 2014**Urban design content in planning curricula -an international comparison of the UK and Germany****Author:** Andreas Schulze Baing¹¹ *The University of Manchester***Corresponding Author:** andreas.schulze.baing@manchester.ac.uk

The extent to which urban design is part of planning education can vary between countries and even within a country between specific university programmes. The mode of teaching urban design (studio project versus lecture) can also vary (Faga, 2019). Being

educated as a planner in Germany where urban design is a key part of planning curricula, it always surprised me that this can be different in the UK. So I want to understand why that is and explore the scope for improving this.

As a first step I plan to analyse the extent of urban design content in planning curricula for RTPi accredited master programmes. Then I plan to compare this to German university planning curricula. I also plan to compare the accreditation requirements for planning programmes –so what is required to be a fully accredited planner.

One working hypothesis is that the discretionary planning system in England and other parts of the UK does not require planners to be urban designers, because in development management, planners respond to proposals including urban design concepts, hence would not need to know how to create urban design themselves. This is in contrast to regulatory systems, where publicly developed zoning plans often work as a rigid urban design regulation (Schulze Bäing and Webb, 2020). To explore this, I plan to compare the English planning practice to the practice in Germany, where a detailed zoning system requires local authority planners to have detailed urban design knowledge.

Urban Development and Design Pedagogy at the University of New South Wales, Sydney –a critical reflection

Author: Karl Friedhelm Fischer¹

Co-authors: James Weirick¹; Jodi Lawton

¹ *University of New South Wales*

Corresponding Authors: j.weirick@unsw.edu.au, j.lawton@unsw.edu.au, k.fischer@unsw.edu.au

This paper focuses on the creation and implementation of a post-professional graduate program on urban development and design at UNSW, the Master of Urban Development and Design (MUDD).

The program was conceived with the conviction that urban design only has purchase on the reality of city making as an integral component of urban development. The complexity of this interrelationship demands years of study in a stand-alone, studio-based curriculum, grounded in experiential learning for graduate students from many disciplines.

The curriculum drew upon a synthesis of three bodies of knowledge about the city:

- spatial political economy, the manifestation in urban form of global patterns of capital formation, investment and disinvestment;
- urban design principles and paradigms, normative models of ‘good city form’ grounded in aesthetic, social and environmental concerns; and

- ‘urban design as public policy’, the intersection of public policy, design principles, the deal-making of the property sector and defence of the public realm.

Planning theory and practice as typically taught in the Anglophone world from a social science base is necessary but not sufficient for this educational endeavour. From the outset, the program was driven by two challenges of our time. First, urbanisation on an unprecedented scale in human history. Second, the emergence of the urban project as an instrument of late capitalism. Both entailed an international commitment in terms of the academic staff, student body, theoretical content and design studios overseas working with fellow universities, city agencies and eminent design firms. As a counterpoint to this strong international focus, urban development in Sydney was drawn upon as a continuing case study. The studio projects and associated research, which addressed critical urban issues across five continents, were documented in exhibitions and yearbooks as a cumulative teaching resource – a record of engagement with the complexities of physical city making for each new class of students and the design culture of Sydney.

SS_11 THE VALUE AND ROLE OF DESIGN IN PLANNING EDUCATION / 2006

Designing for Sustainability: Interdisciplinary Urban Planning Education Strategies in Norway

Author: Anna Kaczorowska¹

¹ *Norwegian University of Science and Technology, Department of Architecture and Planning*

Corresponding Author: anna.kaczorowska@ntnu.no

Urban planning education faces challenges related to rapid global change, social and spatial transformations in cities, and climate change. It promotes sustainable practices, place-making, and participatory models while emphasising interdisciplinarity as essential for addressing contemporary urban issues. New educational approaches must incorporate emerging technologies and renew existing thinking, frameworks, methods, and long-standing technical, cultural, institutional, and social premises and perspectives to improve teaching and learning practices.

The role of design in planning education is emphasised as a way to engage with the complex processes of urban development and planning. Since urban planning draws from a variety of disciplines—including geography, economics, history, sociology, psychology, cultural studies, transport, and engineering—its interdisciplinary nature fosters a critical understanding of spatial forms and processes. This approach encourages moving beyond normative methods through design exploration, testing, and performance.

Students are encouraged to adopt a design mindset and develop flexible, interdisciplinary approaches. The student planner's work must be adaptable to the studied context and the actors involved, modifiable through practice, and aligned with the specific interests of individuals and society.

In addition to developing writing and speaking skills, students are encouraged to communicate complex urban processes using clear graphic representations that are easily understandable and transferable through digital technologies for the production, distribution, presentation, and exchange of knowledge.

The "Site Planning" course at Norwegian University of Science and Technology provides examples of how students address these tasks, working in interdisciplinary teams composed of future planners, engineers, facility developers and managers, and other professionals.

Design in Urban Planning Education: An Interdisciplinary Studio Approach

Author: Christine Mady¹

Co-author: Susa Eräranta¹

¹ *Aalto University*

Corresponding Authors: christine.mady@aalto.fi, susa.eraranta@aalto.fi

Recent scholarship challenges solely human-centric approaches to urban design (Yigitcanlar et al., 2019), suggesting a shift in perspective. Consequently, there is a growing recognition of more-than-human perspectives, asking for better integration of designers' views for urban cohabitation (Metzger 2023; Roudavski 2021), for example in the context of urban placemaking in public spaces (Sheikh et al., 2023). However, in planning education the exploration of non-anthropocentric design and futuring remains in its early stages, and the role of design has not yet been widely explored. In this article, we address this research need and focus in this illustrative case study on the questions of why design is important in the education of planners and what the relevance of design is in addressing current challenges such as climate change.

This research builds on a current studio course offered to students of urban studies and planning within an interdisciplinary graduate degree programme in Finland. The studio

is offered to students from several disciplines with the purpose of developing their urban planning skills while integrating methods from the involved disciplines, including design. The studio format has been recognized as a good setting for exploring future challenges as they engage students with real life cases and provide hands-on experiences (Balassiano 2011). The studio theme in autumn 2024 was on rethinking streets for life for humans and other species in light of climate change. The chosen area included both historical neighbourhoods and more recent urban development on reclaimed land. By integrating concepts from interspecies design, the course encouraged a reimagining of streetscapes as multispecies habitats. The agenda combines study area visits, guest speakers representing diverse stakeholders and disciplines. Together they inform experiential and project-based learning.

The studio spans over 13 weeks. In the first part, students explore the study area through site visits, interventions from guest speakers, and data collection using mixed methods. In the second part, students work in interdisciplinary teams to propose specific interventions to the identified urban challenges within the study area. Design thinking and design process were introduced, once the students had identified the challenges they would be addressing. This iterative, and participatory approach enabled students to appreciate the temporal implication of their proposals, and impact at various scales.

Experiences from the course show that design thinking with a more-than-human focus can transform planning education by fostering inclusivity, adaptability, and ecological and ethical awareness. Design thinking encourages iterative problem-solving and collaboration, integrating a variety of perspectives into the design of streetscapes, and redefining public spaces through design as co-inhabited rather than human-engineered. Some of the challenges faced during this learning process is establishing a common language among the members of the student teams as a basis for developing their project. Overcoming this challenge was addressed through the selected teaching and assessment methods. The teachers provide theoretical background by different experts, methodologies, and one-on-one tutoring with each team. The assessment methods include individual reflections on the learning process, peer-learning and peer-feedback, to enhance disciplinary exchange and develop teamworking and project management skills in diverse student teams.

Design thinking and designing as collaborative competencies in planning education

Author: Anja Kristin Standal¹

Co-authors: Elin Børrud²; Pavel Grabalov²

¹ *Norwegian University of Life Sciences*

² *Norwegian University of Life Sciences (NMBU)*

Corresponding Authors: pavel.grabalov@nmbu.no, elin.borrud@nmbu.no, anja.standal@nmbu.no

The paper will present and discuss challenges in interdisciplinary student collaboration where the students have different skills and experiences in design and visualization. The paper is based on the reflections on ten years of teaching “Projects in urban development: Architecture, form and space” course. Approximately 60 students participate every year and belong to three different master’s study programs: landscape architecture, real estate development and urban and regional planning. The course focuses on urban development at project level and within the context of a specific Norwegian municipality. The students are organized into interdisciplinary groups, and their design skills vary. This exposes the students to practice-relevant situations where they can explore opportunities and test quality goals related to physical density, structural relationships and effects on the city’s form and content. The assignment is a feasibility study in the first stage of a planning task, where the visual material is used in analyses, idea development and presentation stages. The data employed in this study involves a combination of students’ work, course assessments, and teachers’ reflection on didactical challenges. The aim of the paper is to demonstrate the power of design as an instrument for interdisciplinarity and complex problem-solving. We argue that design is a powerful tool to prepare students for dealing with socio-spatial challenges and that visual literacy plays an important role in understanding the spatial dimension and foreseeing the future.

Who teaches urban design to planners in Poland? Challenges for planning curricula and implications for urban space

Authors: Piotr Kryczka¹; Magdalena Belof²

¹ *University of Wrocław*

² *Wrocław University of Science and Technology*

Corresponding Authors: magdalena.belof@pwr.edu.pl, piotr.kryczka@uwr.edu.pl

Urban design education, unfortunately, holds a marginal position within spatial planning curricula in Poland (Belof & Kryczka, 2024). This situation stems from the absence of coherent program requirements and recent (2022) formal classification of spatial planning field of study to the discipline of human geography. As a result, there has been a radical weakening of the educational links between planners and architecture and landscape architecture. Consequently, this shift has led to a departure from creative, design-oriented methods in favour of analytical competencies, prioritizing subjects such as spatial and socio-economic analyses, particularly within GIS environments.

The diminished emphasis on urban design education within the curriculum can, to some extent, be mitigated through the quality of its delivery. However, this largely depends on the specialized expertise and practical design experience of lecturers, as well as their ability to employ innovative and unconventional pedagogical approaches to engage students effectively. Nonetheless, our preliminary observations reveal systemic issues in this domain, including the lack of standardized qualifications for academic staff. This absence of clear guidelines risks further marginalizing urban design as a subject and undermines students’ capacity to understand the principles governing urbanized spaces and to address associated challenges creatively.

In this study, we aim to assess the quality of urban design education by analyzing the academic profiles and professional competencies of lecturers responsible for teaching this subject within spatial planning programs at Polish universities. The study will examine trends and pedagogical methodologies employed by various institutions and address critical questions: Who is responsible for delivering urban design education? What is the extent of their expertise in this field? And what potential implications might this have for the academic rigor and practical relevance of urban design education in Poland?

The study will integrate quantitative data concerning academic programs and employment alongside qualitative insights obtained through direct interviews with management and teaching staff at various Polish universities. By employing this approach, it aims to stimulate a broader discussion regarding the value and role of urban design within spatial planning education in Poland. Furthermore, it seeks to verify whether current educational practices and trends align with global developments in urban design education for planners.

Teaching Design to Planners: pedagogical approaches from the UK

Author: Juliana Martins¹

Co-author: Manuela Madeddu²

¹ *University College London*

² *University of Liverpool*

Corresponding Authors: m.madeddu@liverpool.ac.uk, j.martins@ucl.ac.uk

Urban design is integral to planning education. Although its weight in planning programmes varies considerably (Frank, 2006), the knowledge and skills that planners acquire through an integrative design focus in their education are fundamental to addressing the complex challenges of cities. However, teaching design to planners poses a variety of challenges. Senbel (2012, p. 449) identifies two main issues: first, the lack of space in already packed planning programmes to “nurture a gradual development of spatial thinking with the requisite graphic presentation skills”; and second, the particular “pedagogical mission” of planning education, which, in contrast to architecture or

landscape architecture, assigns priority to the analysis of diverse socioeconomic contexts. Despite the long tradition of teaching design in planning schools, there is limited research about the design teaching available to planning students on different courses, and the pedagogical approaches that are employed and appropriate to teach design in this context.

In this presentation we examine pedagogical approaches to urban design teaching in two planning departments in the UK (at the University of Liverpool and University College London). We consider the value of teaching design to planners at undergraduate and postgraduate levels, the use of project based / studio modules, and how particular challenges encountered in the delivery of design content might be overcome. The findings show that design teaching is key to spatial literacy, with essential skills developed in short timeframes. But, the resource intensity of design teaching increases pressure for its removal, or reduction, in planning curricula. We argue that well-structured and supported teaching, group work strategies, interdisciplinary projects and community engagement provide the means to further enhance design teaching in planning education -and to ensure that design remains planning education's integrative focus.

Urban Design Studios and Service-Learning in Planning Education

Author: Vicente del Rio Nascimento¹

Co-author: Hemalata Dandekar¹

¹ *California Polytechnic State University San Luis Obispo*

Corresponding Authors: hdandeka@calpoly.edu, vdelrion@calpoly.edu

The application of urban design theories and methods in a studio setting is fundamental in planning curricula as it allows us to test and visualize the physical and spatial implications of what planners generate through policies, programs, zoning, and land use regulations. However, the role of these studios is threatened. Planning's move towards the social sciences shifted interest towards social, economic, political, and cultural problems. Academic culture and accreditation boards increasingly required educators to have doctorates and engage in scholarship and publication, creating a culture that promotes traditional teaching over experimental, studio-based, community embedded projects. Increasingly tighter budgets exert pressure on studios as they require more time than a regular class from both students and faculty, require more space, serve fewer students, and involve a constant search for clients and "real" projects. Threats increase as planning programs develop more flexible curricula, embrace on-line teaching, and focus on moving students faster towards graduation.

In this presentation we will discuss the urban design four-studios sequence in the planning program at California Polytechnic State University, San Luis Obispo, USA. We will focus on the service-learning opportunities these studios had with local jurisdictions and private parties over a 25-plus year period. Dealing clients and "real problems" has proven to be an engaging and efficient method to reach the learning objectives while

providing students with a strong sense of satisfaction and self-confidence. The contracts help paying some of the extra costs involved in the studio and these opportunities allow us to give back to the communities served by Cal Poly and popularize what planners and urban designers can do. Our discussion will draw from insights from the authors' experience, from other faculty members, from assessments by the Planning Accreditation Board, and from surveying current and former students engaged in the profession.

Evaluating the 15-Minute City Concept in Ankara: Resident Perceptions of Accessibility in Çankaya and Keçiören

Author: Ebru Vesile Öcalır¹

Co-authors: Özge Yalçiner Ercoşkun¹; Ceren Ercoşkun¹; Buse Türkoğlu Erbaş¹; Hilal Tulan Işıldar¹; Anna-Lena van der Vlugt²; Janina Welsch²

¹ *Gazi Üniversitesi*

Corresponding Authors: cerenercoskun@gmail.com, tulanhilal@gmail.com, anna-lena.vlugt@ils-forschung.de, janina.welsch@ils-forschung.de, ebruocalir@gazi.edu.tr, ozgeyal@gazi.edu.tr, busetrkgil@gmail.com

The concept of 15-minute cities has gained global attention as a sustainable urban planning model aimed at creating cities where residents can access essential services and amenities within a 15-minute walk or bike ride from their homes. This model emphasizes accessibility, reducing reliance on cars, and fostering more livable and inclusive urban spaces. This study explores the perceived accessibility of two districts in Ankara, Türkiye (Çankaya and Keçiören) through the lens of the 15-minute city framework. The research employs walk-along interviews as the primary methodology, engaging local residents in real-time assessments of their urban environments. This study is a part of the DUT-funded project, AccessCity4All.

The walk-along interview method involves participants in walking with the researcher through their neighborhoods while sharing their experiences and perceptions of accessibility, convenience, and safety. This approach allows for an in-depth exploration of how residents interact with their urban space, highlighting the gaps between idealized planning models and lived experiences. By focusing on Çankaya, an affluent old district with high infrastructure, and Keçiören, a more densely populated area with varying levels of new development areas, the study contrasts the accessibility of two different urban contexts within Ankara. Preliminary findings suggest that while both districts have areas that align with the 15-minute city ideal, significant challenges remain, particularly in terms of pedestrian infrastructure, safety concerns, and access to essential services in more densely populated or less-developed areas. Keçiören residents, though less educated, are pleased with their streets, having shaped them into their version of a 15-minute city. Meanwhile, Çankaya residents, who are more educated, often criticize their streets for problems like lack of cleanliness, obstructive pavements, and poor quality. The study highlights the importance of considering local context and resident perceptions in urban planning, and it calls for a more inclusive approach to designing cities that truly prioritize accessibility for all citizens. These findings contribute to the growing discourse on sustainable urban mobility and the practical realities of implementing the 15-minute city concept in diverse urban environments.

SS_12 RETHINKING ACCESSIBILITY IN THE 15-MINUTE CITY: GLOBAL PROJECT INSIGHTS / 2054**Positive and Normative dimensions of accessibility by proximity for supporting a fair and sustainable 15 min city model****Author:** Paola Pucci¹**Co-author:** Giovanni Lanza ¹¹ *Politecnico di Milano - DASTU*

The presentation introduces several dimensions of the concept of accessibility by proximity that may better frame the actual contribution of proximity in different planning experiences finalised to promote the Xmin city model. Challenging an acritical use of the proximity concept based on the physical spatial-temporal conditions and a focus mainly on dense compact urban contexts, the presentation proposes to enrich this concept by combining a functional dimension of proximity, with a relational one, focused on the exchange of resources and collaboration spontaneously activated in a community, sharing specific accessibility-related needs, problems and mobility opportunities. Based on this, the presentation aims at

Introducing some considerations on the relationship between the Xmin city model and the accessibility by proximity concept and its relevance for a potential paradigm shift for reorienting transportation and land use planning toward increasing the availability of services, activities, and social contacts in proximity to reduce the need for travel, towards less extensive but more active and sustainable forms, and helping to reinforce internal community ties (Ferreira et al. 2003, 2007).

Proposing a declination of proximity (as a mean) and accessibility by proximity (as an end) that can contribute to deal with the challenging issues in the implementation of X min city. Among them: the risk of standardising people's needs and underestimating the demands of different social groups, reproducing existing inequalities (Cooke et al. 2022); and limited replicability in several different socio-spatial as in suburban, peri-urban and rural areas (Guzman et al., 2021); an increase in housing prices, gentrification and displacement of vulnerable populations (Dunning et al. 2021; Haarstad et al., 2022; Poorthuis & Zook, 2023) exacerbating social divides (Guironnet and Halbert, 2020).

Presenting an operative framework for dealing with new metrics of accessibility by proximity and its positive and normative dimensions, based on the results of two research projects (<https://ex-tra-project.eu/>; <https://commonaccessproje>).

This study evaluates walking accessibility to urban amenities in cities from five distinct countries: Lisbon, Vienna, Münster, Groningen, Ankara (Keçiören and Çankaya). Focusing on both general residents and the elderly population, the research assesses the spatial distribution of essential services such as healthcare, education, retail, financial services, leisure, and sport facilities within a 15-minute walking distance. The cities are compared based on the geographic coverage of these services and the population served, highlighting socio-spatial inequalities in different urban settings. In Lisbon, accessibility is higher for recreational and retail services, while healthcare and education exhibit significant gaps. Elderly residents experience reduced physical access, except for pharmacies, whose distribution better reflects areas with higher concentration of this demographic. In Vienna, the homogeneous distribution of services ensures broader coverage across all categories. However, educational and financial services show lower accessibility in areas with higher elderly population. Münster demonstrates a constrained allocation of healthcare and retail services in less densely populated areas. Despite this, parks and green spaces effectively meet the needs of both general and elderly residents. Groningen reveals marked disparities between urban and peri-urban areas, with services like secondary schools and financial institutions concentrated in urban centers. The elderly face greater accessibility challenges, except for recreational spaces and facilities, which remain highly accessible. Similarly, in the Turkish capital city of Ankara (districts of Keçiören and Çankaya), healthcare services have medium-to-high accessibility, with pharmacies and primary healthcare centers serving most residents. Yet, amenities like gyms, pools, and banks are less accessible in low-density areas. The elderly population has limited access to educational and recreational services, underscoring the need for targeted interventions. Overall, compact cities like Vienna and Lisbon tend to perform better in accessibility, whereas cities with lower density or peri-urban sprawl face significant challenges. This analysis highlights the importance of adapting urban policies to meet the needs especially of vulnerable groups, aligning with the principles of the 15-minute city concept.

The supply structures of shared mobility services and emerging access issues in marginalised communities

Author: Noriko Otsuka¹

Co-authors: Janina Welsch¹; Christian Gerten¹

¹ *ILS Research gGmbH*

Corresponding Author: noriko.otsuka@ils-forschung.de

This paper discusses the methodological framework for examining the current spatial supply structures of three types of shared mobility services (car-, bike-, and e-scooter) to develop a typology according to socio-economic and socio-cultural characteristic of potential users. It forms part of the DUT-funded project, Share4Equity, which aims to explore the current and potential contribution of shared mobility services to help realise the ideas of equitable transport, mobility justice and the 15-minute City. Previous research finds that marginalised users are generally more exposed to negative impacts of transport decision making, and they often face accessibility inequalities as new mobility services emerge. Furthermore, the digital divide and differences in competences and capabilities in using shared mobility services between different population groups are considered as one of the main causes for creating new forms of transport inequalities. Transport justice is one means of examining how opportunities for shared mobility are distributed across society and how to reduce car-dependency in the 15-minute city context. In our research, three dimensions of transport justice (distributive, procedural and epistemic) will be used to analyse: 1) the supply and distribution of shared mobility services, 2) user perceptions and experiences, and 3) the inclusivity of different forms of sharing. Research presented in this paper focuses on the supply structures of shared mobility options, using case studies from European countries (Germany, Sweden, Italy, and Poland) and from Canada, ranging from privileged inner-city districts to car-dependent peri-urban areas. The comparison will inform the current state of supply: 1) by visualising (un)even spatial distribution of shared mobility, and 2) by substantiating whether large cities are advanced units of progress. Drawing on previous work (Groth et al, 2023), we present our methodological framework for evaluating the supply structures of selected cities or city regions and for visualising the spatial supply patterns of shared services. We plan to intersect them with spatial and census data on residents' socio-economic characteristics in different administrative districts of case study cities/regions. We aim to elaborate which types of variables correlate with supply patterns (distributive dimension) in order to reveal determinants of the current spatial distribution of service supplies.

The 15-minute city concept has become a popular and actionable framework for accessibility-based planning. However, narrow interpretations of the concept are problematic as they prescribe a complete decentralization of urban functions overlooking the holistic nature of the 15 min city concept. Such narrow interpretations

may lead to unrealistic goals or adverse effects on sustainability and social inclusion, particularly in less dense urban areas, limiting the concept's applicability and its ability to achieve desired outcomes. Therefore, this paper proposes pathways for place-based, people-centred accessibility planning to achieve the underlying ideals of the 15-minute city across diverse urban forms. Departing from the view that cities function as complex adaptive systems, characterized by dynamic and partly uncoordinated interactions among urban agents, the paper calls for a condition-based approach that fosters various potential transport and land-use configurations within set but adaptable normative boundaries. Participatory processes and adaptability are central to this approach, as they enable co-exploration of development pathways and responsiveness to change through generating situational accessibility knowledge, mutual learning, and cyclical assessment of normative boundaries.

Supporting the urban decision-making through a “GLOcal knowledge-System for the Sustainable Assessment of urban projects”

Authors: Beatrice Mecca¹; Francesca Abastante¹

Co-authors: Francesco Piras²; Giuliano Poli³; Valeria Saiu²

¹ *Politecnico di Torino*

³ *Università degli studi Federico II di Napoli*

Corresponding Authors: francesco.piras@unica.it, giuliano.poli@unina.it, francesca.abastante@polito.it, beatrice.mecca@polito.it, valeria.saiu@unica.it

Nowadays effective systems for monitoring, reporting, and evaluation appears to be relevant for governments to enhance urban-level decision-making. Indeed, monitoring the areas, plans and projects implemented in the urban environment and evaluating projects before their implementation turns out to be crucial practices for making informed decisions and supporting sustainable transitions in cities. In this context, the research project GLOSSA “GLOcal knowledge-System for the Sustainable Assessment of urban projects” of Relevant National Interest (PRIN) proposes an Indicators-Based Tool (IBTool) to support decisions in urban transformation projects, coherent with the 2030 Agenda and the Sustainable Development Goal 11 (SDG11), aiming at fostering the sustainable development of Italian cities. More specifically, the output of the research foresees: a set of indicators that may be helpful for both monitoring and evaluating the sustainability of urban projects at the district and building scale; and a multicriteria evaluation tool able to manage specific set of indicators and to outline their level of importance and priority considering different territorial realities as well as multiple phases of the design problem (selection, design and monitoring). The objective of the output of GLOSSA is threefold: i) to support Public Administrations (PAs) and planners/designers in the identification of urban areas to be transformed and in the design of urban transformation projects; ii) to support PAs in the evaluation phase of the urban transformation projects to be presented; iii) to monitor the performance of the funded projects. Accordingly, the research shows, through some Italian case studies, how the proposed methodology can contribute to help face the challenges of sustainability of our cities, especially from the point of view of decisions.

The IBTool is conceived as an open-source toolbox with the aim of being: i) multi-dimensional by putting together environmental, socio-economic and cultural indicators; ii) cross-scale by being applicable from a neighborhood to building scale; iii) flexible since it allows the selection of specific indicator according to the urban transformation projects; iv) expandable by providing the possibility of including further indicators that can be generated according to the changing needs or goals; v) multi-purpose understood as the possibility that each tool can be employed along with others or separately according to multiple temporal assessment phases. We observe that the primary beneficiaries of the IBTool are: i) PAs (national, regional and municipal) that will be supported in the identification of urban areas to be transformed, in the evaluation of projects and in the consequent allocation of monetary funds, as well as in monitoring the performance of the projects in an ex-post phase; ii) planners/designers that will be able to use the IBTool to define projects oriented towards sustainable development. In parallel, some secondary beneficiaries can be identified, such as: i) Master's and PhD

students who will be able to be trained in new models and tools; ii) experts who will be consulted in the different project phases and will be able to find in the IBTool a platform for exchange; iii) citizens who will benefit from the innovations brought about by new project defined through the support of the IBTool, in terms of improving the quality of life in the areas that will be transformed.

A More Than Human Approach to Landscape Storytelling and Planning: Interactions Between AI and Problem Structuring Methods

Authors: Benedetta Grieco¹; Sabrina Sacco²; Maria Cerreta¹

¹ *Università degli Studi di Napoli Federico II*

² *Department of Design, Polytechnic University of Milan, Via Durando 10, 20158 Milan, Italy*

Corresponding Authors: sabrina.sacco@polimi.it, maria.cerreta@unina.it, benedetta.grieco@unina.it

The adoption of innovative technologies, such as Artificial Intelligence (AI), is redefining Problem Structuring Methods (PSMs), expanding their capacity to address complex and unstructured problems (Sacco & Poli, 2024). AI, understood as a set of computational techniques capable of analyzing vast amounts of data, simulating scenarios, and constructing multidimensional narratives, enhances PSMs' ability to manage uncertainty and engage stakeholders. Traditionally, PSMs have been used to structure decision-making in uncertain and multi-actor contexts, facilitating the representation of different perspectives and addressing complex, ill-structured problems resistant to conventional solutions (Mingers & Rosenhead, 2004). Their integration with AI combines PSMs' strengths in navigating complexity with AI's advantages in processing and interpreting data, opening new possibilities for more comprehensive and nuanced decision-making

frameworks. This synergy emerges as an interesting perspective to enrich landscape planning strategies, where the integration of PSMs and AI could enable a more inclusive and articulate representation of ecological, social, and technological components.

In this contribution, the concept of landscape is examined starting from the framework of Ecosystem Services (Hermann et al., 2011), one of the most widely used approaches in landscape studies. In this framework, landscapes are understood as complex systems that deliver essential services—such as provisioning, regulating, supporting and cultural services—to communities, emphasising the landscape's values for their role in offering benefits to human well-being. Viewed as a tool for community benefits, the landscape loses its subjectivity, turning into an object from which value is extracted. From this perspective, unfortunately, the use of PSMs and AI in this context only reinforces this mindset. While PSMs effectively capture landscape complexity, their predominant focus on human interests limits their ability to account for the interconnections between human and non-human entities. This anthropocentric bias presents a challenge, as it does not fully align with the intrinsic complexity of landscapes, where multiple agents—both human and non-human—interact in dynamic and often unpredictable ways. Conversely, AI offers unparalleled opportunities to reinterpret landscapes, enabling new ways of narrating their complexity. However, an overly predictive approach risks oversimplifying issues, potentially overlooking the nuances and the inherent poetic nature of landscapes and their intrinsic value (Cerreta, 2010). This paper explores the advantages and limitations of adopting PSMs and AI in landscape planning strategies, aiming to identify opportunities from both approaches to develop an integrated vision for landscape values and evaluation.

A compelling alternative perspective emerges from the concept of More-Than-Human (Haraway, 1985), which challenges the traditional anthropocentric paradigm by acknowledging the agency of non-human entities, including ecosystems, biodiversity, and technological infrastructures. Adopting a More-Than-Human approach in landscape planning invites a fundamental rethinking of landscape decision-making processes, encouraging the inclusion of multiple voices—both human and non-human (O'Connor & Kenter, 2019). Rather than providing definitive answers, this contribution aims to outline a landscape-centered framework that could foster a shift in the way the landscape is narrated.

Through the lens of a More-Than-Human approach, the paper investigates how it is possible to integrate PSMs and AI in moving beyond an anthropocentric vision, fostering a deeper understanding of landscape complexity. This shift has the potential to create more inclusive, resilient, and sustainable landscape narratives, better equipped to address contemporary challenges where complexity and uncertainty play a central role. By embracing this perspective, landscape planning can transition towards a more adaptive and ethically grounded practice, capable of responding to the evolving needs of both human and non-human actors in a rapidly changing world.

Assessment of Climate Change Adaptability and Risk based on open data: The Case of Italy

Author: Ozge Ogut¹

Co-authors: Benedetta Cavalieri¹; Claudia De Luca¹; Elisa Conticelli¹; Giulia Marzani¹

¹ *Department of Architecture, Alma Mater Studiorum, University of Bologna*

Corresponding Authors: claudia.deluca5@unibo.it, giulia.marzani3@unibo.it, ozge.ogut2@unibo.it, benedetta.cavalieri2@unibo.it, elisa.conticelli@unibo.it

Climate risks are becoming increasingly critical as climate change intensifies globally including Italy, where the effects are visible through increase of extreme events such as heatwaves and floods. Addressing climate change requires localized assessments that integrate environmental, socio-economic, and climatic factors to guide targeted adaptation strategies. This study focuses on evaluating climate adaptability and risk across Italy using two composite indices: the Climate Change Adaptability Index (CCAI) and the Climate Change Risk Index (CCRI). Both indices are developed using open data sources, including ISTAT (Italian National Institute of Statistics) and ISPRA (Italian Institute for Environmental Protection and Research), ensuring broad accessibility. This methodological approach highlights both the potential and the challenges of using publicly available data for urban decision-making.

This contribution utilized GRInS (project titled Growing Resilient, Inclusive, and Sustainable) taxonomy that represents a methodological approach aimed at classifying Italian territories based on their functional and spatial characteristics. By following this methodology, the Italian municipalities are divided into three macro-classes as follows i.e., Inner Italy (Italia Interna), Metropolitan Italy (Italia Metropolitana), and Intermediate Italy (Italia di Mezzo). Each macro-class has micro-classes within.

On one hand, the CCAI (which varies from -1 to +1) measures resilience by balancing exposure to climate hazards with adaptive capacity indicators. Specifically, it incorporates Consecutive days without rain, Duration of hot periods, Average temperature increase (1960–2008), Tree canopy density, and Soil permeability. Results show stark regional disparities: northern Italy demonstrates higher adaptability, particularly in Alpine regions. Conversely, southern regions, including Calabria and Sicily, exhibit lower scores. When analyzed through the territorial typologies, Inner Italy shows mixed adaptability, with remote areas benefiting from natural assets (0.34) whereas denser zones near metropolitan areas (0.05) face challenges. Intermediate Italy varies as well, with coastal areas scoring moderately (0.26) and urban-rural plains showing negative adaptability (-0.13). Metropolitan Italy remains vulnerable, with capitals scoring the lowest (-0.44) due to high exposure and urbanization.

On the other hand, the CCRI (varies from 0.13 to 0.77) evaluates the intersection of climate hazards and socio-economic vulnerabilities. It combines Consecutive days without rain, Duration of hot periods, Average temperature increase from 1960–2008, and the Socio-economic vulnerability index (SEVI, another composite index elaborated by the

authors) to identify areas of heightened risk. Findings highlight significant challenges in southern and rural areas, where socio-economic fragility compounds climatic stressors. For example, inner Calabria experiences extended dry periods exceeding 40 days, exacerbating its vulnerability. In Inner Italy, sparsely populated areas near metropolitan regions have high values (0.52) due to 31.21 consecutive dry days and SEVI (0.45). In contrast, northern and central metropolitan regions, like Lombardy, show lower risk (0.36–0.40) with shorter dry spells (22.18 days) and stronger economic resilience, though capital cities still face localized risks (0.42) from urban heat and socio-economic disparities. This dual-index approach also shows the need for place-based strategies. Enhancing natural resilience through reforestation and urban greening, coupled with socio-economic initiatives to reduce inequalities, is critical. The study emphasizes the importance of governance reforms and participatory planning to support equitable climate adaptation, and contributes to methodological advancements for public administrations and urban planners navigating the complexities of urban transformation.

This study emphasizes the innovative integration of positive and negative indicators to support decision-making through assessing territorial vulnerability. By combining natural and socio-economic dimensions, the approach offers actionable insights for enhancing climate adaptability and risk reduction.

How does software support decision-making processes in the group dynamic?

Authors: Isabella M. Lami¹; Elena Todella¹

¹ *Interuniversity Department of Regional and Urban Studies and Planning (DIST), Politecnico di Torino, Italy*

Corresponding Authors: isabella.lami@polito.it, elena.todella@polito.it

In the digital age, it is crucial to reflect on the role and relevance of urban structuring and decision-support methods.

The overall aim of SUITE research (Decision support in an urban context in the digital age: interactions and uncertainties) is to explore this issue, through a main research question: is the concept of Problem Structuring Methods (PSMs) (Rosenhead and Mingers, 2001; Shaw et al., 2006) and Multi-Criteria Decision Analysis (MCDA) (Greco et al., 2016; Munda, 2019) still relevant in a world accelerated by technology and digital innovation? This research takes a firm and substantiated stance on its relevance: structuring and decision support methods are still significant, but contextual conditions, in particular the digital revolution, may have changed the way they are to be used and the purpose for which they are applied, and this is exactly what we want to focus on. This research intends to investigate, within a decision-making process, the affordances enabled by the use of a specific artifact, a new software called Multi-Values Appraisal Methodology (MuVAM) created on a multi-methodological approach recently introduced in the literature (Lami and Todella, 2023). MuVAM combines the Strategic Choice Approach (Friend and Hickling, 1987, 2005) with the Analytic Hierarchy Process (Saaty, 1980), and it is based on cloud-based technologies, which allow synchronized and connected use, digitally and also in asynchronous mode.

The study investigates the contribution of the software to group interaction and the development of a “Plural Subject” through the analysis of eight workshops, held in four different European countries, in three languages (English, French and Italian) and on four different case studies, all related to sustainable urban development. In particular, the applications differed with respect to: i) the scale of intervention, ranging from the planning of an entire city area to that of a university campus; ii) the outcome, which in

most cases concerned the definition of a master plan. Interestingly, the participants in the workshops were also quite diverse: Bachelor's, Master's, PhD and Lifelong Learning Master's degree students, with a varied experience in terms of educational level and background. Feedback from the workshops was collected through a report or a Google survey, through a series of questions covering both group dynamics and individual choices.

Multi-stakeholder perspective in participatory street experiments

Author: Imge Akcakaya Waite¹

¹ *Istanbul Technical University*

Corresponding Author: imgeawaite@itu.edu.tr

Participatory and inclusive urban mobility schemes have been rising as a significant trend in response to various challenges that arise in street transformations, such as political, financial and regulatory obstacles. The multiplicity and diversity of stakeholders that influence and that are influenced by planning and design decisions are important factors to take into account when devising these schemes (Bertolini, 2020). A multi-stakeholder perspective in participatory street experiment processes involves engaging a diverse range of individuals and groups in the planning, design, and evaluation of urban interventions (Beyazit et al., 2023). This includes residents, local businesses, government agencies, urban planners, and advocacy groups, each offering unique insights and priorities. By considering varying needs and values, the approach fosters collaboration and ensures that solutions are equitable, inclusive, and context-sensitive. It encourages dialogue, addresses conflicts, and promotes collective ownership, leading to more effective and sustainable outcomes (Healey, 2006). Such a perspective strengthens community engagement and enhances the likelihood of long-term success in street transformation projects.

Working closely with local administrations and other local stakeholders in Istanbul, Turkey, and Klagenfurt, Austria, ACCTRA focuses on street experiments as an opportunity to engage stakeholders and generate evidence on both the impact and acceptance of measures. This creates the basis to support political decision-making in favor of street transformations, inform planning processes for permanent implementation, and foster institutional learning processes to adapt processes and better deal with conflicts over transformations. In the Istanbul case of ACCTRA, relevant stakeholder groups specifically involve residents who integrate active transportation modes into their everyday lives, those who are affected by these modes, and those who operate them, among others. Stakeholder mapping outcomes provided input for tailored planning and design of the street experiment. In order to get the stakeholder input, an on-site participatory stakeholder workshop was held, integrating an interactive urban walk and other engagement methods.

Consequently, this study narrates two processes of ACCTRA's Istanbul case: First, the stakeholder analysis and mapping that incorporated idiosyncratic power dynamics of the decision-making process. Second, the participatory multi-stakeholder workshop, its outcomes, and how these outcomes informed the micromobility street experiment decisions and implementation in Maltepe. The results highlight the lessons and recommendations derived from the case study and how they can be applied to future street experiments that strive to be transformative, participatory, and widely accepted by all relevant stakeholders.

Translating street experiments into policy change: Tactical micromobility transformation in Istanbul

Authors: Bahadır Keşan¹; Bekir Bartin²

² *Özyeğin Üniversitesi*

Corresponding Authors: bekir.bartin@ozyegin.edu.tr, bahadirkesan@gmail.com

Street experiments are highly effective tools for increasing the efficiency of decision-making and planning processes. They allow citizens to gain experience related to the implementation, provide feedback, and offer an opportunity to observe how projects function in real life and help identify and minimize unforeseen issues at the “experiment” phase before the actual implementation. Additionally, citizen feedback contributes to aligning projects more closely with societal needs and fosters a participatory approach in the planning process.

Maltepe Municipality is a local government with extensive experience in street experiments. Previously, the municipality carried out participatory tactical urbanism projects in various areas focusing on different concepts¹. This time, under the ACCTRA project, a new street experiment has been designed with a focus on micro mobility.

Micromobility modes, such as e-scooters and bicycles, have the potential to expand the catchment area of public transportation (PT) stations. To that end, this street experiment leverages the popularity and increased use of micromobility vehicles, and integrates micromobility to a PT station via an Exclusive Micromobility Lane (EML) on a local feeder street to strengthen multimodal connectivity. The EML lane was designed to connect an existing bicycle lane to a Light Rail Service Station located in Maltepe, and act as an additional feeder mode for micromobility vehicles that ensure safe and comfortable connection to the selected PT station.

Project area was selected due to various its advantages such as flat surface, access to public transport, the residents’ experience from previous street experiments, participation culture of local people and access to an existing bicycle route. The project offers an invaluable opportunity to make an evidence based and participatory decision-making process with the collaboration of governmental bodies and academic institutions.

In addition, as part of the ACCTRA project an online survey was administered to investigate travelers' mode choice decisions in Istanbul and the potential impact of EMLs. The survey collected data from 1,000 residents of Istanbul regarding their current travel behavior, perceptions of various micromobility modes, and preferences through stated choice (SC) experiments. These SC experiments provided a robust framework to analyze travelers' preferences across different transportation options and to estimate the impact of EMLs on mode choice. SC experiments included two primary types of journeys: solo car trips and multimodal PT trips, which combined an access/pre-transport segment with the PT journey itself. Each participant was presented with six choice scenarios, each featuring four distinct transportation mode options: solo car, bus-train, e-scooter-train, and walking-train. The survey data were analyzed using a mixed logit model to assess the influence of various trip attributes, such as cost, travel time, comfort, and the availability of an EML on PT station accessibility. The results provide insights into the role of micromobility in enhancing PT accessibility and shaping mode choice preferences.

SS_14 TRANSFORMING STREETS FOR LIVEABILITY AND SUSTAINABLE MOBILITY THROUGH EXPERIMENTATION AND PARTICIPATION / 1970

Achieving transformation through involvement and evidence? Reflecting street experiments' impact on planning processes

Author: Gunnar Grandel¹

¹ MOVE, TU Wien

Corresponding Author: gunnar.grandel@tuwien.ac.at

As the climate crisis accelerates, a mobility transition is urgently needed, tackling car dependency (Banister, 2008, IPCC, 2023, p. 103) and fostering a broader shift from 'space for traffic' to 'space for people' (Bertolini, 2023). However, the implementation of projects reallocating public space for sustainable transportation, climate adaptation measures, and social life is often challenging, facing significant political resistance, financial limitations or regulatory obstacles. As traditional planning approaches have recurrently struggled to achieve the hoped-for effects, there has been a shift towards experimental approaches in the last decade: In practice, approaches like parklets, summer streets, pop-up bike lanes, or superblocks have spread globally, especially accelerated by the pandemic. In academia, "street experiments" (Bertolini, 2020) has become an umbrella term for the phenomenon and fuelled an expansive body of literature.

At the heart of these developments is an understanding that short-term interventions can be a lever for long-term change. This includes the expectation that their temporary nature allows for testing more radical ideas without the effort and cost of traditional infrastructure projects (Meinherz and Fritz, 2023), that they can enable learning processes about implementation and impacts, strengthening transformative capacities (Kinigadner et al., 2024), or that they help increase social acceptance of more far-reaching interventions, because they are flexible and reversible, allow for participation and make

potential benefits tangible (Stevens et al., 2024). However, the understanding of how and under which conditions street experiments can lead to transformation is still limited.

Therefore, this presentation explores the interrelations between experiments' ability to generate specific knowledge and the expectation of experiments to increase acceptance for transformation, drawing on results from the project ACCTRA (Evidence and Acceptance –from Experiments to Transformation). Working closely together with municipalities, the project supports the implementation of street experiments in Istanbul and Klagenfurt, Austria. In the project, participation and stakeholder involvement processes on the one hand, and data-driven analyses and evaluation of the experiment on the other, are interlinked.

Focusing on the case of Klagenfurt, the involvement process will be presented, including stakeholder analysis, communication, and on-site participation during the experiment, to discuss the opportunities and limitations of engaging a broader public and key stakeholders for street transformations with experiments. Second, the evaluation methodology and results will be outlined to compare different kinds of knowledge, such as data about the impacts of measures, acceptability or resistance, or the lived experience of users, and their relevance for different actors such as politicians, municipal officials, planners, or media. Third, the processes initiated by the street experiment are traced, discussing the interplay of involvement and evaluation, and reflecting on the role of researchers in transformation processes.

Transforming urban spaces: The role of play and recreation in creating a thriving Istanbul

Authors: Cigdem Cakar¹; Merve Akdag¹

¹ *Istanbul Metropolitan Municipality*

Corresponding Authors: merve.akdag@ibb.gov.tr, cigdem.cakar@ibb.gov.tr

PLAY ISTANBUL initiative's comprehensive approach encompasses a range of strategies and projects, the major one being the establishment of an official department called Play and Recreation Chieftaincy which has been charged with the responsibility of monitoring

and implementing the initiative's vision. The overarching vision emphasises the significance of people's well-being and access to play as a fundamental pillar in building a more liveable and flourishing Istanbul. This ambitious undertaking has been brought to life through a concerted effort by a diverse network comprising locals, children, institutions, and NGOs. The initiative has been designed to foster a more liveable urban environment, by applying six major criteria, namely creativity, sustainability, accessibility, safety, innovation and inclusivity in creating and renewing play and recreation infrastructure. The initiative's approach encompasses a range of strategies and projects, including participatory design and production workshops, inclusive play and tactical strategies, open dialogue sessions and pedestrianisation games with stakeholders. The initiative has led to the establishment of numerous pop-up playgrounds and unstructured play services, extending beyond neighbourhoods in Istanbul with limited accessibility to green spaces and recreation services, even in post-disaster contexts following the earthquake. The presentation will provide an overview of the actions taken to achieve inclusive spatial design goals in Istanbul.

Playful approaches to street transformation

Author: Hilda Tellioglu¹

¹ *TU Wien*

Corresponding Author: hilda.tellioglu@tuwien.ac.at

Gameful participation with tangible objects and collaborative design games introduce innovative ways of engaging stakeholders in urban development. Design games are playful and facilitate structured idea creation by securing collaboration. They contain physical materials and clear rules, driving discussions and insights. A specific example is the "StreetForum Design Game" where players collaboratively design shared urban spaces at street level. First envisioned as an analog board game, in the subsequent versions, the StreetForum developed further, adding Augmented Reality (AR) features and a fully digital version on the MIRO platform. Such a flexible format –from fully analog to hybrid, analog-digital –allows for very diverse groups of participants to access and engage in the game. While sharing a common perspective, the game actually empowers the residents and planners with improved sensitivity regarding the real urban needs, tackling the challenges of that community.

Meanwhile, "MoBil" –another StreetForum tool developed –makes urban space dynamic and multifunctional for playing, learning, meeting, and creating diverse activities. This collaborative process promotes long-term co-creation and end-user involvement and allows communities to develop a space that would grow with them. It is also envisioned that the project will turn into one of the global models in leading urban design, sharing methods and design in an open-source tool with the aim of diffusing innovation and adaptability on an international scale. Together, these both tools show that participatory design and gamified collaboration can drive impactful and sustainable urban development.

This topic is a unique opportunity to discuss the nexus of play, design, and urban development. The discussion of novel applications of gameful participation and tangible objects will provide insight into how structured, interactive tools like design games foster collaboration and creativity among stakeholders. The "StreetForum Design Game" provides a strong case study in which such methods translate abstract challenges into concrete, shared experiences that empower both residents and planners. From the analog board game to a hybrid model with the integration of digital and analog aspects and embedding AR, it shows in one go how adaptable and inclusive these approaches are meant to be. The same goes for the tool "MoBil", which truly opens an avenue for co-creative processes to redefine urban space –not as static entities, but as living, dynamic

ones that evolve in congruence with needs. These dialogues around these tools not only underline their potential for changing the course of urban planning but also call for versioning with scalability, effectiveness, and position regarding their role and approach as open-source models for global adaptation. This debate has the potential to create new concepts and expand the vision on sustainable participative urban development.

Narrative-based approaches to street transformation

Author: Lluís Martínez^{None}

Co-author: Lotte Luykx¹

¹ *Vrije Universiteit Brussel*

Corresponding Authors: lluis.martinez.ramirez@vub.be, lotte.luykx@vub.be

Street transformations are often complex processes that must navigate diverse perspectives and competing interests, making consensus-building both essential and challenging. Narrative-based approaches, such as storytelling and role-playing, offer a powerful means to bridge these gaps by fostering empathy, promoting reflective thinking, and enabling a shared understanding of different viewpoints. In the StreetForum project, we developed, tested and evaluated three narrative-driven tools aimed at engaging stakeholders in Brussels, Istanbul, Stockholm, and Vienna in 2024.

These tools –Stakeholder personas, Storytelling game and Rich pictures.talk –encouraged participants to reflect on their lived experiences, share them with others and walk in someone else's shoes. While they demonstrated great potential to support street transformations, their use was not without obstacles. Participants' familiarity with the street, time constraints, and the varying cultural and social contexts significantly influenced the tools' effectiveness.

This presentation will introduce these StreetForum tools, their development process and their impact assessment, reflecting on the benefits and challenges of using them. It will provide recommendations on how to best use narrative-driven tools, such as ensuring flexibility and accessibility to different stakeholder needs and cultural settings.

Corresponding Authors: tymon.wolender@polito.it, manuela.ronci@polito.it, loris.servillo@polito.it

The topic of Urban Water Management has experienced a major shift in recent decades, driven by increasing environmental awareness and evolving social expectations. This shift marks a paradigmatic change, offering an opportunity to restore rivers to a central role in urban development, reflecting their historical interdisciplinary significance and multiple values. From being resources historically subjected to intensive exploitation, rivers can once again be recognised as living systems with their own dignity. While they can support the biological cycles of multiple species, they can also provide opportunities for development and regeneration of the urban fabric, becoming crucial drivers for re-thinking the metabolism and complex dynamics of cities. Among the array of emerging water-related strategies, projects, and frameworks, the Water Sensitive City (Wong and Brown, 2009) approach stands out for its comprehensive engagement with urban disciplines and spatial dynamics. Leveraging this innovative approach and the possibilities of river-centred transformation, this paper aims to contribute to the discussion on Urban Water Management and Spatial Planning interdependencies. It explores Turin's urban river areas through the lenses of legacy, river-city interaction, and collective spatial imaginary, aiming to enhance the practical application of the Water Sensitive City model. By highlighting the importance of urban rivers and advocating for a more river centric perspective to spatial planning and design, this research aims to foster a renewed focus on river-oriented centrality, positioning rivers as pivotal elements in addressing the complex challenges of urban transformation within contemporary urban complexity.

In order for co-existing, in a just way, with the excess of water in a small favela

Author: Alessio Mazzaro¹

¹ *Politecnico di Torino, DIST*

Corresponding Author: alessio.mazzaro@polito.it

Torresmo is a community, in the eastern periphery of São Paulo, Itaim Paulista, inhabiting an informal settlement divided by a stream whose recent channelization increased the incidence of flooding.

The hydraulic safeness of the Brazilian megalopolis is planned by the Secretary of Infrastructures (SIURB) through numerical modeling -of the presence of water and its drainage- and design, mainly, of gigantic lamination basins, Piscinões. These reservoirs, a third border for the rivers (de Mello Franco et al 2007), are usually built in peripheral areas where soil is less expensive (Millington 2021) and in proximity of informal settlements where the non legal occupation of space may afford an opaque making of the infrastructure. Recently, likely due to the activities of a Living Lab in the area, the SIURB proposed the construction of a Piscinão in Torresmo to repair the issues exacerbated by the previous channelization. The existence of this project became an occasion -for the inhabitants and the lab- to envision the redeveloping of the river space in terms of spatial and cognitive justice (de Sousa Santos 2015), imagining the construction of recreation spaces above the lamination basin and starting the negotiation for its “fair construction”. Grounding on fieldwork experience, collaboration with the lab, and participatory art activities, this presentation discusses the undergoing spatial processes and dynamics linked to the construction of the Piscinão. Furthermore, it addresses how the inhabitants are (re)constructing their relation with water forms by reflecting with design concepts such as surface runoff and the size of the basin.

Over the centuries, the process of urbanization has progressively expanded, altered and modified the natural water cycles: water has been urbanized. This paper proposes to analyze water infrastructure as the intertwining of distinct but yet interconnected networks: surface, ground, drinking, runoff, wastewater. With the development of increasingly complex water machines, mainly conceived as a solely technical space, the link between the urban space and the water as an element and as a cycle has been progressively lost. Water urbanization has heavily modified not only each water system individually (through river vaulting, diversions, canals, dikes, drainage, supply and sanitation networks and devices) but also and most importantly the way in which they function as a whole, the way in which they interface.

This paper proposes to read the process of water urbanization through the notion of water interfaces, defined as the spaces where different water systems meet, and where to analyze water as a systemic infrastructure and as a common culture at once. Water urbanization will be explored documenting, mapping, categorizing water interfaces within

different socio-economic contexts: Bruxelles (BE); Sicily and Ravenna (IT); Kinshasa (DRC); Dakar (SNG). This approach will provide firstly a comparative overview on how water cultures have been modified by urbanization in the proposed case studies, secondly a systemic understanding of the role and potential that specific practices play as spatial interfaces between infrastructures and place-based cultures.

Visualising the Terrain for Water Resilience: A methodology to visualise and communicate the systemic effects of design interventions in a water system.

Author: Oisín Fee¹

¹ *TU Dublin*

Corresponding Author: oisfee@gmail.com

Investigations into water systems have seen a renewed emphasis in recent times. Brought on by a diverse range of issues from water scarcity, urban flooding, ecological damage due to human processes, and rising sea levels, water has become an increasingly pertinent research topic. Firstly, this research project intends to investigate a methodology of how we understand and visualise water systems through a general systems thinking (GST) lens. Utilising the idea of 'System Leverage' as a framework, we shall explore through design-research how understanding the wider system can lead to alternative design approaches to water resilience infrastructure. A secondary goal of this research is to help develop a tool for interdisciplinary decision-making when designing water-resilience measures in a rural Irish context. This tool takes on a digital format with the aim to describe to an audience how small interventions in the landscape-system can leverage the overall water system to a beneficial outcome. These speculative interventions are described across a series of systemic scales to inform about their overall impact on the system. Future benefits from this tool may be to become an effective format for disseminating systemic interventions to an audience of stakeholders and design consultants e.g. ecologists, hydrologists.

Small town inner-city centres –cases from Germany. Insights from research on processes, concepts, tools

Author: Silke Weidner¹

¹ *Brandenburgische Technische Universität Cottbus-Senftenberg (BTU)*

Corresponding Author: weidner@b-tu.de

During the COVID-19 pandemic, small towns have complained less about massive problems of sudden inner-city desolation. On the one hand, this was due to the fact that the inner cities and location-based retail had already experienced severe problems in previous years due to the growth in online retail, and on the other hand, the short (communication) distances proved to be very helpful. The German Ministry of Housing, urban development and building launched in 2022 the so called “Future-proof city centers and centers” funding program in which 218 municipalities are participating to date. 61 of them are small towns between 5,000 and 20,000 inhabitants. It is worth taking a look at the measures for inner city stabilization, reactivation and upgrading with regard to the selected instruments, tools, concepts and forms of cooperation - also in comparison to the approach in large cities. There are both differences and similarities in terms of strategies and measures to make inner cities more mixed-use, climate-friendly, attractive and resilient. Based on evaluations from the accompanying research for this funding program, the presentation aims to provide insights into the current inner city development of small cities. Findings from the quantitative (indicator evaluation) and qualitative evaluation can be presented and discussed in an overview and comparison as well as in a strikingly illustrative way using individual case studies.

Urban-systematic-quantitative analysis of metropolitan functions in small towns

Author: Anna Growe¹

Co-author: Thomas Terfrüchte²

¹ *Kassel University*

² *TU Dortmund University*

Corresponding Authors: anna.growe@uni-kassel.de, thomas.terfruechte@tu-dortmund.de

Metropolitan regions and metropolitan areas have been the subject of empirical urban systems research for many years. In contrast, the focus on small and medium-sized cities has been more recent, primarily through regional case studies and theoretical-conceptual analyses. Europe-wide comparative empirical analyses are rare and often

unsuccessful due to a paucity of available small-scale data. This article endeavors to address this lacuna by leveraging small-scale data concerning the functional organization and demographic evolution of European cities. The functional data originate from the raw data of the BBSR study on metropolitan areas in Europe (2011), while the demographic data are derived from the time series adjusted for territorial reforms (1961-2011) and the 2021 census data from Eurostat.

The central objective of this article is to respond to the research question concerning the statistical explanation of variations in the perceived importance of small and medium-sized cities across nation states. The hypothesis, grounded in extant research, posits that characteristics of national urban systems can account for a substantial portion of these variations (e.g., primacy city vs. decentralized concentration). As a control, the extent to which demographic developments can statistically explain the differences in importance is tested. This is predicated on the assumption that urban functions exhibit a high degree of location persistence, while suburbanization processes, for example, lead to changes in population figures in the core cities and their surrounding areas. Furthermore, cities belong to different city size classes over time, while the functional significance remains largely unchanged.

Preliminary research conducted by Terfrüchte and Growe (2023) indicates that functional distinctions are not invariably associated with specific city size classes or their positioning within or outside metropolitan areas, nor are they necessarily contingent on their proximity to metropolitan cores. However, the unique characteristics of national urban systems can contribute to a more nuanced understanding of the phenomenon. For instance, economic functions in the Scandinavian countries are localized more frequently than average in small and medium-sized cities, while in Germany or Italy the majority of functions are localised in large cities.

In addition to providing theory-based explanations, the article also addresses the special features of national administrative structures. These features make a comparison of cities below the NUTS 3 level (in Germany, districts and independent cities) almost impossible. While there exist explanatory approaches (derived inductively from individual cases) for developments in the urban system beyond the metropolitan areas, there is a paucity of empirical material to test corresponding hypotheses on the significance of small and medium-sized towns (SMSTs) across Europe.

Knowledge Economy in Germany - Small Towns in the Shadow of Large Cities?

Author: Madeleine Wagner¹

¹ *Karlsruhe Institute of Technology (KIT)*

Corresponding Author: madeleine.wagner@kit.edu

The increasing dynamism of the economy and the intensifying competitive environment are precipitating novel challenges for societies of knowledge, organisations and enterprises. Urban areas are recognised as focal points for social-spatial, cultural and economic activities within metropolitan and rural contexts. Despite the increasing connectivity facilitated by Information and Communication Technology (ICT) and the subsequent integration of rural areas into communication networks, empirical studies conducted on

metropolitan regions suggest that large cities and their environs continue to be attractive hubs for creative and knowledge-intensive employment opportunities.

The flexibilisation of work and the increasing agglomeration disadvantages in large cities have led to an increased focus on knowledge-intensive activities in the development of urban hinterland. However, the extent to which large cities also borrow specific functions from small towns in the surrounding area in the opposite directions (Mayer/Knox 2010), and can benefit from their facilities (Meijers/Burger 2022) has been largely ignored (Wagner 2024).

The objective of this paper is therefore to analyse the role of small towns with regard to the knowledge economy in the surrounding areas of the 50 large city regions in Germany between 2012 and 2019. The methodology employed in this study involves an analysis of spatial concentration patterns of the knowledge economy, categorised according to distinct knowledge bases, namely analytical, synthetic and symbolic. Secondly, I will compare functional specialisation processes of knowledge-intensive occupations in large towns and small towns in large city regions. The central argument of this study is that specialisation processes can occur in small towns independently of the development of the core city.

Finally, the argument is made for multidimensional perspective on city-hinterland developments that consider different town size classes, location factors and the needs of knowledge-intensive employment.

New planning tools and project opportunities towards a more sustainable revitalization of very small settlements and local communities in peripheral territories

Author: Valeria Francioli¹

¹ *University of Florence - Architecture Department (DIDA)*

Corresponding Author: valeria.francioli@unifi.it

In the recent debate about the sustainability of our lifestyles in the cities, the current status of small urban settlements and their interdependent relationships are frequently overshadowed and neglected by the so discussed expansion of bigger metropolitan cores. The actual focus of the debate that arises, in terms of spatial nature of metropolitan development, affirms that among bigger metropolitan cores, the social fabric and the economic sectors of these highly urbanized regions are deeply interlinked with the dense network of small and medium-sized towns and rural areas they are placed. A wing of the urban planning debate argues that in current times the tendency to adopt place-based narratives in the forming of metropolitan territorial vision shapes small towns and leads them to have a higher impact on local and regional planning, with a broader vision in order to promote territorial cohesion and wide-area cooperation. This significant role that small towns acquire in proximity and connectivity of metropolitan areas - or entire

peripheral regions - overturns the narrative and brings the spotlight on them as new horizons of the future territorial planning practice, making us wonder if small towns can be placed in the wide and articulated debate on territorial planning for sustainable development. Dealing with future narratives and imaginaries of small towns and major metropolitan areas, the debate should propose a shift of perspective from the tendency to focus on negative narratives (e.g. depopulation, economic shrinkage, brain drain, lack of essential services) to a more optimistic view made of simplicity, social ties, short distances, direct contact with political authorities and decision makers. This possible future is always conditioned by actual real challenges linked not only to the spatial dimension of the phenomenon but also to the social and economic one, leading to ask whether the smallness of a settlement can contribute to the improvement or generation of quality exchanges in the community that lives it. Within this panorama, a fundamental step leading to a rebirth and repopulation of these territories passes from new social, economic and cultural dynamics that could land to new networks of these peripheral realities in broader contexts, where proximity becomes an area and represents a real challenge in shaping new place-based policies. This contribution tries to investigate how these very small and peripheral realities can lead to a more inclusive system of territorial governance and to a better improved access to essential services (health, instruction, mobility) and public goods through new different forms of area planning influenced by soft governance dynamics. New tools to support the identification of the potential linked to a specific location as narrative, metaphorical and real basis of a negotiated programming tool (e.g. River Contracts, Contrats d'Axe etc.) that includes multiple actors with the aim to realize or enhance the existing, shape inclusive, resilient relationships between society and the environment and, finally, reach shared urban design strategies and projects aligned with the community needs, as well as a formal commitment to make them operational through the partnership of a plurality of subjects.

SS_16 SMALL TOWNS -BIG CHALLENGES AND HIGH POTENTIALS? / 2072

On the subject of a 'revenge' for small towns, based on the French example

Author: Helene MAINET¹

Co-authors: Helene ROTH ¹; Jean-Charles EDOUARD ¹

¹ *Université Clermont Auvergne*

In the scientific literature, small towns are often presented as places with a combination of demographic (population decline), economic (marginalised by globalisation) and even social (high concentration of poor people) vulnerabilities. In France, research on small and medium-sized towns has a long history, but scientific debate and the focus on metropolisation issues overshadowed them in the 2000s. They have also been ignored since the 1970s by public actors and policies, which for the last decade or so have been focusing their attention on metropolises and rural areas. However, a renewed interest in and for small towns has been visible since 2014 and a national programme for revitalising town centres, a revival of attractiveness accentuated since the covid-19 crisis.

The aim of this presentation is to examine the factors explaining this new context and interest. It also attempts to objectivise the elements of dynamism or “revival”, to use the terminology often employed by the media, by studying the reality of the socio-economic and demographic situation of small towns in France. Against a backdrop of small towns being put on the political agenda, three topics in particular are explored: the great return of centrality, urban decline and development models. Finally, we look at the major future challenges facing small towns and local actors, if they want to confirm their “renaissance”.

This presentation is based on general trends of small towns in France as well as some specific case studies chosen to illustrate specific challenges and locally implemented policies (such as Thiers or Saint-Eloy-les-Mines), from recent scientific literature and recent studies carried out by various research and institutional bodies.

Special Session 17 | PERSPECTIVES ON COMMONING MOBILITY AND ACCESSIBILITY

SS_17 PERSPECTIVES ON COMMONING MOBILITY AND ACCESSIBILITY / 2057

Commoning Accessibility: Reframing Accessibility as a Common Good

Authors: Paola Pucci¹; Giovanni Lanza¹

¹ *Politecnico di Milano - DASTU*

Recently, a range of community-driven practices aimed at improving accessibility has gained increasing prominence and recognition. These initiatives, which emphasize the critical role of accessibility as a fundamental resource for activity participation and social inclusion, are characterized by a reliance on collaboration among individuals actively engaged in the co-creation and governance of shared mobility solutions, as well as community-managed proximity and digital services. In this framework, these practices challenge the traditional view of accessibility as an individual concern, reframing it as a collective matter that can be addressed through collaborative efforts to meet shared needs. In essence, they suggest that accessibility can be understood as a common good.

Despite its transformative potential, this perspective remains underexplored in planning theory and practice. Nevertheless, it offers promising opportunities to innovate the conceptualization, analysis, and delivery of accessibility through new approaches to proximity, mobility, and digital connectivity. This potential is particularly evident in spatial contexts where access to activities requires resource-intensive motorized travel due to the scarcity of accessible facilities in proximity. Such contexts include peri-urban areas, urban peripheries, and other low- to medium-density areas, which often exhibit lower levels of accessibility compared to the so-called “15-minute city” model associated with dense, compact urban centers. These areas frequently pose significant barriers to access and participation, particularly for specific populations such as young and older people, and those without access to private motorized transport. In such scenarios, initiatives in which accessibility is commoned through the co-production and sharing of opportunities for access and participation by a community—broadly defined to encompass private citizens, NGOs, local authorities, and private companies—offers a promising solution to local challenges. These initiatives address specific accessibility needs that might otherwise remain unmet by conventional forms of provision, such as market-driven services or state-managed infrastructure. Moreover, they provide critical and innovative insights into how inclusive and sustainable mobility solutions can be fostered, even beyond compact urban environments.

Recognizing the social and political significance of reframing accessibility as a common good, this paper builds on the theory of the commons and the concept of “commoning mobility” proposed by Nikolaeva et al. (2019) to introduce the notion of Commoning Accessibility (CA). This innovative conceptual framework redefines accessibility as an essential resource for activity participation and needs fulfillment, one that can be commoned through specific collaborative initiatives (Commoning Accessibility practices) co-produced and maintained by the collective actions of proactive actors (Communities of Access). The concept of CA originates from a comprehensive research project on commoning accessibility in Europe (the Common_Access project, available at <https://commonaccessproject.com>) and is outlined in Deliverable 2.1 of the project. This paper elaborates further on the concept, incorporating insights from recent research developments.

This paper aims to deliver new and impactful policy insights for developing and promoting innovative methods and regulatory frameworks for accessibility provision within communities under the CA framework. The paper presents a range of examples and case studies, analyzing these experiences through a multidimensional lens to uncover critical insights for urban planning and fostering the effectiveness and scalability of these practices across a variety of territorial contexts.

SS_17 PERSPECTIVES ON COMMONING MOBILITY AND ACCESSIBILITY / 2058

Commoning mobility knowledge

Author: Anna Nikolaeva¹

¹ *University of Amsterdam*

Corresponding Author: a.nikolaeva@uva.nl

‘Commoning mobility’ emerged as a prominent concept in recent scholarship on just mobility transitions. From this perspective, which redefines mobility as a ‘collective good’, mobility is social and shared: mobilities are co-produced in that people plan and perform mobilities together. Given the interdependence and materiality of mobilities, people shape each other’s lives as they move (or remain stationary) at various scales. This emphasis on co-production of mobility and people’s interdependency resonates with the feminist urban scholarship, yet these two bodies of literature have rarely been brought in dialogue. Both strands of literature present an alternative to the dominant, technocratic vision of mobility, which foregrounds direct individual journeys. One facet of mobility planning that remained underexplored in both debates is the role of knowledge, despite growing attention to the issue of epistemic injustice in planning broadly and in planning just mobility transitions, in particular. Drawing on feminist epistemologies, this paper makes an innovative contribution to the field of planning by developing the notion of ‘commoning mobility knowledge’. This approach entails questioning the basic assumptions that condition planning’s intersectional exclusions. It also involves de-centring dominant questions, categories, themes, methods of knowledge production, and ways of using knowledge. For planning practice, commoning mobility knowledge would mean reconstituting mobility planning knowledge from multiple vantage points, acknowledging and mobilising the embodied, situated knowledges of marginalised groups, and centring women and minoritised groups as legitimate knowers. The notion of commoning mobility thus helps conceptualise alternative approaches to mobility knowledges and urban imaginaries that are missing or are marginalised in academia and practice. The paper will offer some concrete examples of advancing scholarship and practice in this direction by focusing on urban care, mobilities of leisure as well as some methodological considerations.

Commoning for post-growth mobilities? A critical perspective on two railway cooperatives

Author: Elisa Schramm¹

¹ *University of Amsterdam*

Recent post-growth scholarship has begun to problematize the strong growth orientation in transport planning, with new investments in transport serving primarily as ‘spatial’ or ‘mobility’ fixes, rather than serving other socio-ecological objectives. However, it has done so in ways that reproduce public sector-led and/or individual mobility transformations. It has thereby overlooked a wide range of community-led bottom-up initiatives, limiting the breadth of possible alternative solutions to enable post-growth mobilities. This paper addresses this gap by critically assessing the role of transport cooperatives as ways to ‘common mobilities’, with both cooperatives and the commons/commoning often claimed as strategies particularly suitable to post-growth. In particular, it builds on interview data and participant observation to examine two railway cooperatives, Railcoop in France and Go-op in the UK. This paper analyses their potential for post-growth mobilities by drawing together commoning scholarship with a nascent body of post-growth transport and mobilities literature, assessing commoning dimensions around access, use, benefit, care and responsibility along with the external risk to be ‘enclosed’ as further ‘mobility fixes’ fuelling economic growth. It foregrounds the importance different transport modes’ material specificities (here: trains and train tracks) in enabling and/or limiting the potential for post-growth mobility commons by shaping (a) affordability, rendering cooperatives more vulnerable to outside pressures, limiting access, uses and benefits (b) the dominance of national governance regimes of different transport modes, limiting autonomous decision-making within cooperatives and (c) the degree of expertise necessary to participate in decision-making, rendering them vulnerable to unequal (care) responsibilities.

commoning; cooperative; post-growth; materiality; expertise

SS_17 PERSPECTIVES ON COMMONING MOBILITY AND ACCESSIBILITY / 2060

Understanding Commoning Accessibility in the Context of the European Welfare State

Author: Annemiek Prins¹

¹ *University of Amsterdam*

This paper critically situates the notion of ‘commoning accessibility’ within the wider context of the changing European welfare state. In many peripheral areas across Europe accessibility is under pressure due to the privatization and deregulation of public transport, the enclosure and commercialization of public spaces, and the withdrawal of services such as healthcare. Recently, the notion of ‘commoning accessibility’ (CA) has been introduced to account for the various ways in which communities mobilize and organize themselves to (re)claim accessibility as a common good. For example, through setting up community transport and shared mobility schemes or collective efforts to create and maintain place-based social, cultural and care amenities. Drawing on fieldwork conducted on CA practices in rural and peripheral areas in the Netherlands, this paper asks under what conditions commoning can play a critical and transformative role in improving access to important services. Whereas on the one hand the notion of commoning carries the potential of radically transforming planning and policy paradigms by denaturalizing private ownership and recentering values such as sociality and care, CA practices are also –inevitably– a product of larger policy conditions and agendas. Indeed, it could be argued that the need for these practices is very much shaped by the increased transfer of government responsibilities around public service delivery to citizens, as part of changing configurations of the welfare state. This paper speculates about how to retain the critical potential of commoning accessibility as a concept when understood as part of this wider trend towards the responsabilization of citizens.

Special Session 18 | SMART CITY AS A TRANSFORMATIVE APPROACH? CONCEPTUALIZING DIGITAL TOOLS IN SPATIAL DEVELOPMENT IN A CONTEXT OF AGEING

SS_18 SMART CITY AS A TRANSFORMATIVE APPROACH? CONCEPTUALIZING DIGITAL TOOLS IN SPATIAL DEVELOPMENT IN A CONTEXT OF AGEING / 1977

Utilisation and evaluation of activity opportunities by baby boomers. Challenges in rural, suburban and urban areas

Author: Annette Spellerberg^{None}

Corresponding Author: annette.spellerberg@rptu.de

The baby boomer cohort, which makes up around a quarter of Germany's population, is gradually retiring. Individual time budgets are changing radically as a result; activities that were previously assigned to 'recreation' and 'leisure' (e.g. active sports, shopping, excursions) determine everyday behaviour and mobility. Additionally, the advancing digitalisation of almost all areas of life is opening up new opportunities in urban and rural areas, changing everyday practices and spatial relationships, e.g. through platform-economy, booking services and e-commerce (Parker, et al. 2016). At the same time, it can be assumed that hobbies and activities will be retained during the transition to retirement and adaptation to the new phase of life (Kohli, Künemund 2000). In municipalities, the ageing population and digitalisation pose new challenges. Comparatively little is known about the assessment of activities, neighbourhoods and communities by baby boomers and the consequences for local stakeholders.

This article focuses on the following questions: Which municipal services are used by baby boomers and how are they evaluated? How do baby boomers deal with digital services and tools? What socio-structural and spatial differences are evident and can population groups with a high level of dissatisfaction be identified? The aim of the article is to analyse what action is required to improve the participation of baby boomers in different settlement areas.

The data basis is a representative survey of 50- to 75-year-olds, conducted by the Department of Urban Sociology in 2022 as part of the project 'Ageing Smart - designing spaces intelligently' in seven municipalities (rural, suburban, urban) in three federal states (see www.ageing-smart; funded by the Carl-Zeiss-Stiftung).

SS_18 SMART CITY AS A TRANSFORMATIVE APPROACH? CONCEPTUALIZING DIGITAL TOOLS IN SPATIAL DEVELOPMENT IN A CONTEXT OF AGEING / 1929

Smart cities and transformative action: Conceptualizing smart cities for an ageing society in the Japanese planning culture

Author: Karina Pallagst¹

Co-author: Jonas Pauly¹

¹ RPTU Kaiserslautern-Landau; Faculty of Spatial and Environmental Planning

Corresponding Authors: karina.pallagst@ru.rptu.de, jonas.pauly@ru.rptu.de

Today, all over the world many cities are applying smart solutions, and position themselves as Smart Cities, but how are Smart Cities conceptualized in different planning cultures? Spatial planning systems are based upon different institutional and cultural conditions. While these may present comparable features, these planning systems were designed to operate in distinct cultural, normative and spatial situations (Pallagst 2010). Research by Sorensen (2015) suggests that planning cultures might change when faced with “critical junctures of institutional change and innovation in planning systems” (Sorensen 2015). One of these critical junctures might be the context of digitalization. In order to conceptualize planning cultures and digitalization, the authors suggested a research frame involving digitalization in the facets and layers of planning culture (Pauly and Pallagst 2023). The research on changing planning cultures in view of digitalization is a novel field, and - in general - implementing Smart Cities already might have initiated changes in planning cultures, which is one of the main hypotheses of this paper.

When looking at the Japanese planning culture, the planning system is highly centralized with a focus on economic development and market orientation (Martinez-Fernandez et al. 2016; Pallagst et al. 2018). Plans, programs and policies are developed on national level, and the implementation appears to be strictly top down. Moreover, the Japanese planning culture is challenged by several societal transitions. In particular preparing for disasters and for demographic change and the path towards an ageing society have longstanding impact on policy-making in Japan. For this reason, the planning cultural context needs to involve societal aspects such as the aspect of ageing.

Yet how are smart cities conceptualized in the Japanese planning culture, what are the main drivers and goals, who are the main actors, and which policies are at hand? And -given the societal context of demographic change and ageing in Japan -how is the aspect of ageing taken into consideration in the concept of smart cities in Japan?

This presentation will shed light on conceptualizing smart cities in the Japanese planning culture. Starting with a brief introduction to the concept planning cultures with a special emphasis on Japan, it will present cases of smart cities in Japan, trying to answer the questions outlined above.

SS_18 SMART CITY AS A TRANSFORMATIVE APPROACH? CONCEPTUALIZING DIGITAL TOOLS IN SPATIAL DEVELOPMENT IN A CONTEXT OF AGEING / 1992

Decision support systems as a tool for better comprehensive planning

Authors: Detlef Kurth¹; Corinna Schittenhelm¹

¹ *RPTU Kaiserslautern-Landau*

Corresponding Authors: detlef.kurth@ru.rptu.de, corinna.schittenhelm@ru.rptu.de

Planning tools are becoming increasingly digital (e.g. Bielik et al., 2021; Streich, 2011). But there are still several gaps between analysis tools (mainly with GIS, but also CAD) and design tools (mainly with visualization programs or CAD). At the same time, demographic and other social data as well as spatial data are increasingly differentiated and available at different scales (e.g. Liao et al., 2018; Statistisches Bundesamt, 2022). For this reason, it is important to create a comprehensive planning tool, in our case a Spatial Decision Support System (SDSS), in which the various data and planning tools merge with one another.

One of the aims of spatial planning is to best meet the needs of different population groups and to promote a high quality of life. To do this, planners need to have a comprehensive and detailed understanding of the existing situation and local demand trends. There are already several software applications that can be used to perform insightful analyses of different topics such as population development (e.g. SPSS, R, GIS), infrastructure facilities (e.g. GIS, AutoCAD, InfraWorks) or building typologies (e.g. GIS, UrbanSim, Revit). However, they are often complicated to use, expensive or difficult to configure individually.

This article examines the requirements that local authorities and planners place on a SDSS, as well as its capabilities and limitations. Based on the results of the literature review, the analysis of different use cases and the results of requirements workshops in the model communities as part of the Ageing Smart research project, a number of insights have been gained, e.g. on the consequences of demographic change for social infrastructures. The Ageing Smart project is funded by the Carl Zeiss Foundation.

An analysis of different applications such as the geographic information systems QGIS and ArcGIS Pro or decision support systems such as DaviPlan shows, that the range of possible applications is very broad and that the way they are used varies. For example, more expensive applications often already include basic data such as settlement structures and transport networks, usually in good quality. Free applications usually require users to import this data themselves.

In addition, integrated urban development concepts are not prepared in such a way that the results can be easily integrated into a SDSS. However, in many cases this could be changed by making minor adjustments during the preparation process. A standardized approach to the “basic data equipment” of municipalities would also be extremely important. In the case study of the city of Mannheim, we analyzed, how analysis tools, planning instruments and design concepts could better fit together in the future –to create a comprehensive and effective planning tool for city administrations and decision-makers.

The use of decision support systems is essential for a good, needs-based planning. However, users need to be aware that using them is not enough. They serve as a tool for planners to prepare decisions that can then be evaluated by committees and citizens. In the future, such systems will become much more important for a comprehensive and integrated urban development.

SS_18 SMART CITY AS A TRANSFORMATIVE APPROACH? CONCEPTUALIZING DIGITAL TOOLS IN SPATIAL DEVELOPMENT IN A CONTEXT OF AGEING / 2027

Smart regions in an ageing society - new challenges for spatial planning in relation to healthcare

Author: Kirsten Mangels¹

Co-author: Marvin Stiewing¹

¹ RPTU Kaiserslautern-Landau

Corresponding Authors: kirsten.mangels@ru.rptu.de, marvin.stiewing@ru.rptu.de

The issue of healthcare has become a more important topic for spatial sciences and spatial planning in recent years, not only due to the Covid-19 pandemic, but also due to an increasing shortage of skilled labour. In addition to various approaches to preventive health protection and health promotion, it is also increasingly about ensuring equal living conditions and basic outpatient care for the population in all regions.

This article presents the development and status of a digital decision support system for political decision-makers at local and supra-local level for outpatient healthcare, which was developed as a component of a more complex decision support system in the project 'Ageing Smart - designing spaces intelligently' funded by the Carl-Zeiss-Stiftung (see www.ageing-smart; funded by the Carl-Zeiss-Stiftung). It includes (1) a data-supported analysis of the existing situation / initial situation (development and structure of the population including the household structure and forecasts, existing healthcare provision and forecasts), (2) a dynamic, intermodal accessibility analysis of healthcare facilities, (Stiewing et al. (3) a survey of the affected population on the healthcare situation (here using the example of baby boomers in four model municipalities) and (4) a collection of possible analogue and digital options for action and, hopefully in the future, the possibility of visualising the effects of these in order to be able to discuss and assess different scenarios for action.

The decision support system should also contribute to supporting smart, data- and fact-based planning and political decisions in times of increasingly 'alternative' facts and opinion-based politics (cf. Wiechmann et.al 2024). It also represents an approach to positioning spatial planning more strongly as an actor in this field (cf. ARL 2023) and to qualifying participation processes through a good database and simple visualisations of solution approaches.

SS_18 SMART CITY AS A TRANSFORMATIVE APPROACH? CONCEPTUALIZING DIGITAL TOOLS IN SPATIAL DEVELOPMENT IN A CONTEXT OF AGEING / 1990

Identifying climate-active green spaces with the help of artificial intelligence

Author: Sascha Henninger¹

Co-author: Pierre Müller ¹

¹ *RPTU Kaiserslautern-Landau*

Corresponding Authors: pierre.mueller@rptu.de, sascha.henninger@ru.rptu.de

Man-made climate change is leading to an increase in average air temperatures. This has a particular impact on densely populated and sealed urban areas by intensifying the urban heat island effect. An important instrument for adapting the associated temperature changes is the development, preservation and establishment of green spaces in urban areas. The creation of a green space mapping system is essential for the inventory and further development of green spaces. However, the heterogeneity and diffuse distribution of green spaces in the spatial context make mapping them considerably more difficult. It is necessary to define the concept of green spaces. Subsequently, with reference to the challenge of a complete mapping of all green spaces on site, the extent to which such areas can be identified, delimited from each other and recognised as locally climate-active with the help of artificial intelligence can be investigated.

The initial definition of green spaces is carried out at a general level due to the heterogeneous nature and characteristics of the areas. Various scientific demarcations are used for this purpose. Based on this, they can be categorised as grass or shrub areas, water areas, large shrub areas and vegetation-free ground areas as well as existing trees. The defined green spaces are analysed using a pre-trained deep learning model to identify the general land cover.

The application of this pre-trained deep learning algorithm can identify green areas based on the general land cover. The best values are achieved for inner-city locations. However, the green areas located outside the built structures are often incorrectly delineated due to their nature and labelled as water areas, so that the pre-trained model achieves an overall accuracy of 46%. After assessing the results, the deep learning algorithm is to be retrained to potentially improve the model. Re-training the pre-trained deep learning model using transfer learning leads to a general improvement in overall accuracy to 78%. In this case, the retrained model has a higher level of detail in the assessment of out-of-town green spaces - inner-urban green spaces are identified more poorly compared to the pre-trained model. A subsequent combination of the modelling of the pre-trained and the post-trained deep learning algorithm leads to an overall accuracy of 86%.

Based on this, the climate activity of the green spaces is determined with the help of combination modelling. This is characterised by the potential cooling capacity of the identified green spaces using the proportion of shade, the ground surface and the absolute area size. The green spaces with low climate activity can be found in the heavily compacted and sealed inner-urban locations. With an increase in unsealed areas, the absolute area size and thus the climate activity increases from an initial cooling capacity of less than 1 K in heavily sealed areas to > 3 K in unsealed areas outside the settlement, which then also have a transfer effect beyond the actual green space due to the high cooling capacity.

Ageing smart: A DSS for municipal health planning in an ageing society

Author: Marvin Stiewing¹

Co-author: Kirsten Mangels

¹ RPTU Kaiserslautern-Landau

Corresponding Authors: marvin.stiewing@ru.rptu.de, kirsten.mangels@ru.rptu.de

In recent years, the field of spatial science and spatial planning has seen a resurgence of interest in health-related issues. This development can be partly attributed to the impact of the pandemic and the ongoing demographic shifts, leading to a growing lack of skilled labour (see ARL 2023, p.14). This has long since ceased to be just about preventative health protection (keyword: health-related resilience) and the creation of health-promoting structures in line with the 'Health in all Policies' (HiAP) strategy. HiAP aims to integrate health as a societal responsibility across all policy domains, encompassing the provision of health infrastructures as a foundation for public health and health-related equality of living conditions. Although this approach is still in its infancy in Germany (Köckler and Geene 2022), there is an increasing focus on providing the population with healthcare infrastructure close to home and in line with their needs as a task of public services of general interest (ARL 2023, p.14). This commitment is further underscored by the most recent draft bill on fortifying healthcare provisions at the municipal level (GVSG), which, in its current iteration, outlines a pronounced expansion of municipal involvement in outpatient healthcare. Despite subsequent refinements in the legislative process, the issue of empowering local authorities to play a more active role in shaping healthcare at the local level remains salient. The question, therefore, is how local authorities can effectively fulfil this potential role.

Given this background, this contribution discusses a structured collection of possible municipal options for actively shaping healthcare provision, which was developed as part of a more complex DSS as part of the 'Ageing Smart - Smart structured areas' project funded by the Carl Zeiss Foundation (see www.ageing-smart.de). Building on the analysis and problem definition, the solution-orientated provision of possible options for action in the DSS represents the second step in decision support in the area of healthcare. The aim of this is to safeguard the status quo and avoid qualitative losses in healthcare provision as well as to avoid the threat of an increase in scale in the provision of services combined with a deterioration in accessibility. The options for action provided answer questions about different 'interventions' with corresponding recommendations for decision support and, if necessary, alternative futures as a consequence. In addition to the planning administration and municipal decision-makers, the addressees are also the providers of medical services. The DSS thus enables local authorities to recognise and evaluate options for action in the areas of healthcare, mobility, health promotion and prevention, and to implement them within the framework of various roles. The DSS is therefore not only a tool for data exploration, but also an instrument for actively finding and shaping solutions for existing or foreseeable gaps in care. The analysis and further development of healthcare provision can serve as a model for infrastructure development as a whole.

Exploring the Expropriation of an Urban Space through Lefebvre's Theory of the Production of space: The Case of Gezi Park (İstanbul)

Author: Adile Arslan Avar¹

Co-author: Çifçi Burcu²

¹ *Izmir Institute of Technology*

² *Izmir Institute of Technology*

Corresponding Author: adileavar@iyte.edu.tr

Henri Lefebvre's materialist-dialectical approach to capitalist production of space, taken together with his engagement with revolutionary praxis, offers a possibility of critical and radical intervention to planning theory and practice. While his vigorous analyses of the production of space find resonance in recent critical urban theory, the mainstream urbanism has been almost opaque to his contributions. For Lefebvre, the continuing renewal of capitalist relations hinges upon domination of space and production of space. Here, spatial planning undertakes a major role backed by the state-capital alliance. The locus of the radical praxis would be the dialectics between appropriation and domination of space, between use value and exchange value, between abstract space and social space. These are the dialectical contradictions to be resolved by attacking on capital.

In Turkey, the neoliberal state-capital alliance works in unbridled ways, against which the Gezi Park insurgence in May 2013 exemplifies a striking objection. As urban and non-urban spaces have been profoundly and unevenly reworked through neoliberal-entrepreneurial restructuring of the state and capital across the city, urban and non-urban spaces have been exposed to intensified and expanded expropriation and new enclosures. While capitalist relations penetrate into socio-spatial processes and exacerbate the deep-seated socio-spatial inequalities and crises across the globe, the mainstream planning practice resort to techno-scientism, pragmatism and ecological urbanism. Also, following the "communicative turn," the whole terrain of planning theory is rewoven by post-positivism, post-modernism and post-structuralism. Of course, planning in Turkey poses no exception regarding the reign of these mainstream approaches. We offer an intervention to this by elaborating on Lefebvre's three dimensional dialectics of the (social) production of space, focusing on how the Gezi Park (İstanbul) has been an historical issue of the socio-spatial contradictions of capital, state and society. We also examine and discuss the post-2013 transformation in Gezi Park and the adjacent Taksim Square, and how everything could be different from what it is, again based on Lefebvre.

Urban Conflicts and Movements in Istanbul from the Perspective of an Urban Citizen

Author: Erdoğan Yıldız¹

¹ *Local Activist*

Corresponding Author: erdogany2025@gmail.com

In 2004, an urban transformation process started in Maltepe district of Istanbul, with the Master Development Plan prepared by Istanbul Metropolitan Municipality for our neighbourhoods Gülsuyu and Güleusu. Gülsuyu and Güleusu are two adjacent gecekondu neighbourhoods that have been politically active. The year 2024 can be considered as a turning point for Istanbul since it was the beginning of urban transformation process for all the squatter settlements and dilapidated areas in Istanbul, such as Sarıyer, Sulukule, Tozkoparan, Kartal, Maltepe etc. The urban transformation projects that started in these neighbourhoods triggered resistance as a natural reflex. People living in these areas mobilized their right to housing and right to the city. Professional Chambers such as the Chamber of City Planners and the Chamber of Architects, Universities and neighbourhood associations came together. Numerous demonstrations, workshops and meetings took place.

In summary, Gülsuyu and Güleusu neighbourhoods have prepared alternative master plans and zoning plans in a participatory and collective manner since 2004, and today they are one of the most prepared neighbourhoods on the eve of transformation. It is the most organized neighbourhood with its headmen, associations and councils. In this presentation, I will share with you my experiences in these processes and my perspective as an urban activist.

Gendered Geographies of Fear and Urban Resistance in Istanbul: "Invisible No More!"

Author: Melis Oğuz Çevik^{None}

Recent urban changes in Istanbul have reorganized not just physical areas but also the social fabric of daily life, all within the larger framework of authoritarian neoliberalism. The process and effects of this change, embodied in risk-based redevelopment, gentrification initiatives, and mega-projects, are profoundly gendered. This presentation examines how fear, mobility constraints, and socio-spatial marginalization impact women's urban experiences, drawing on feminist urban theory and current empirical research on Istanbul. It challenges the prevailing planning paradigms that make women invisible in creating and administering cities.

This presentation will focus on how women respond to discriminatory urban policies by creating resistance and micro-strategies. It interacts with the larger theme of conflict and contestation in Istanbul's urban planning by tying together the symbolic and material dimensions of space.

In doing so, the presentation asks how feminist insights might open alternative pathways for inclusive urban futures. It adds a gender-sensitive lens to the session's critical discourse on Istanbul as an "aspiring global city."

SS_19 CONTESTED ISTANBUL: URBAN DEVELOPMENT AND PLANNING CONFLICTS IN TURKEY'

S 'ASPIRING GLOBAL CITY' / 2018**Urban politics in "Post-Gezi" Istanbul and Beyond: Urban redevelopment, grassroots politics and mobilizations****Author:** Deniz Ay¹¹ *University of Bern***Corresponding Author:** deniz.ay@unibe.ch

The Gezi Uprising started as a localized urban protest against the redevelopment plans for Istanbul's Taksim Square, which sought to convert Gezi Park, a public space, into a private commercial development. In the context of post-2008 urban uprisings against austerity urbanism worldwide, the Gezi protests quickly evolved into a nationwide mobilization against the government's authoritarian tendencies. Although the uprising emerged as a reaction to the commodification and enclosure of public space, politically unorganized urban protestors temporarily created ad hoc urban commons within and beyond Gezi Park. While the protestors' primary demand was met by preserving the park, Gezi has since become a symbol of bottom-up, oppositional urban politics and claim-making. Within the context of the special session on "Planning and Conflicts in Istanbul," this paper demonstrates how "post-Gezi" urban politics continue to uphold certain values of localized resistance to profit-driven urban redevelopment projects, yet remain fragmented and marginally unorganized. I also aim to reflect critically on the gap between scholarly analyses, political discourse, and lived experiences of post-Gezi urban politics. This self-reflexive approach will contribute to discussions with fellow panelists on the future of grassroots resistance to urban enclosures and the possibilities of institutionalizing such resistance through urban commons and by rethinking the "public" to demonstrate alternatives to growth-oriented urbanism. Finally, this paper aims to put forward a conceptual question of where uprisings begin and end by building on the rich scholarship on commons to challenge the notion of "post-Gezi" regarding urban politics in Istanbul and in Turkey more broadly.

Keywords:

urban enclosures, urban uprising, Gezi Protests, commons, commoning

SS_20 CHANGING THE STREET-SET: FROM TACTICS TO STRATEGIES, FROM STREETS TO CITIES AND BEYOND / 1941

Rehearsal to Permanent: Transforming Urban Area Using Tactical Urbanism as a Tool

Author: Bahadır Keleşan¹

¹ *Maltepe Belediyesi*

Corresponding Author: bahadirkesan@gmail.com

Street experiments are a crucial tool in enhancing the efficiency of urban planning processes, contributing to the creation of livable and functional cities through participatory approaches. Often known as tactical urbanism, experimental urbanism, or do-it-yourself urbanism, these efforts allow for real-time testing of ideas and concepts to assess their impact on urban environments. Maltepe Municipality in Istanbul has embraced these approaches with notable success, particularly through two key projects: the Zümrütevler Tactical Urbanization Project and the Yalı Neighborhood Tactical Play Street Project. Both initiatives included temporary design interventions, followed by permanent transformations based on user feedback and analysis.

Zümrütevler project marked the first tactical urbanism initiative in Maltepe, targeting a neighborhood with a high population density and a lack of accessible urban public spaces. The project successfully created a safe and healthy public space that caters to the most disadvantaged groups in the community, transforming the area into a place where people can gather, relax, and engage with one another.

Similarly, the Yalı Neighborhood, which was primarily used by children and their caregivers, underwent a transformation into a child- and pedestrian-friendly play street. Despite its proximity to public transportation, the area had limited safe spaces for children to play. After the success of the temporary intervention and with minor adjustments, the design was made permanent, creating a space where children and families can safely enjoy their surroundings. Both projects exemplify the power of tactical urbanism to address immediate urban challenges and enhance the quality of life for residents, making cities more inclusive and accessible for all.

Up-Scaling Safe School Streets at the District Level: Programming for Üsküdar

Authors: Derya Koçuş¹; Dzheyran Karaulan¹; Yasin Çağatay Seçkin¹

¹ *Üsküdar Municipality*

Corresponding Authors: ycseckin@uskudar.bel.tr, deryakocas.itu@gmail.com, dkaraulan@gmail.com

Üsküdar, a strategically located district on the Anatolian side of Istanbul, is one of the city's most densely populated areas, with a population of approximately 600,000 residents. Known for its robust educational infrastructure, featuring over 200 schools and kindergartens, it has become a highly sought-after area for families seeking to raise and educate their children. In 2024, the district's new administration embarked on a transformative vision aimed at creating a child- and play-friendly environment. The Üsküdar Municipality adopted a strategic framework underpinned by principles such as inclusivity, safety, accessibility, play value, and sustainability, with these principles serving as the foundation for a child-friendly urban transformation.

A key initiative under this vision is the "Safe School Streets" project, which seeks to enhance accessibility and promote independent mobility for children. This innovative initiative aims to design safer, more accessible, and livable school environments by incorporating child- and pedestrian-friendly urban design solutions. Through this project, the municipality strives to empower children to experience urban life independently while ensuring their safety and enjoyment as they travel to and from school. The initiative reflects broader principles of creating liveable cities, focusing on making urban spaces more inclusive and accessible for young residents.

The project began with a comprehensive study of school zones across Üsküdar, identifying 10 priority areas for transformation based on environmental conditions, student density, and other key parameters. The first three pilot projects were selected through a SWOT analysis and implemented across three different neighborhoods, showcasing various design typologies. These pilot projects serve as valuable case studies, and the lessons learned from their implementation will inform the design and decision-making processes for future transformations. The upcoming projects will adhere to these design typologies, while allowing for flexibility to adjust based on the unique characteristics of each neighborhood.

The insights gained from the 10 pilot implementations will culminate in the development of a holistic planning and design framework that will guide the transformation of school streets across the Üsküdar district. This framework will be further detailed in a "Safe School Streets Guide," which will provide a comprehensive directive for the management of the Üsküdar Municipality. This guide will ensure that the principles of safety, inclusivity, and accessibility continue to shape the urban landscape, fostering an environment where children can move freely and safely throughout their neighborhood. Ultimately, the Safe School Streets project represents a critical step toward transforming Üsküdar into a model district for child-friendly urban development, promoting healthier, more sustainable, and more equitable communities.

Reclaiming Streets for Children, Communities, and Climate: Regional Learning Circles Driving Change

Author: Görsev Argın Uz¹

Co-authors: Dila Toprak²; Hatice Kübra Baştuğ¹

¹ *Marmara Municipalities Union*

² *Sunum Yapan Yazar*

Corresponding Authors: toprak17@itu.edu.tr, gorsev.argin@mbb.gov.tr

The Reclaiming Streets Program, led by the Marmara Municipalities Union (MMU)—a regional association representing over 190 municipalities across the Marmara region—through its Local Government Academy, is a hands-on learning initiative launched in 2022. Developed in collaboration with Superpool and the Global Designing Cities Initiative (GDCI), the program aims to transform urban streets into vibrant, pedestrian-friendly spaces. By prioritizing people over vehicles, it places special emphasis on creating safer, more inclusive environments for children and caregivers.

Through a combination of training sessions, data collection, hands-on workshops, and real-world interventions, the program fosters collaboration among municipalities and municipal departments, equipping them to navigate the complexities of street design, public engagement, and financial planning. By leveraging tactical urbanism and a phased design approach, the program enhances participation, budgeting, and implementation processes, providing municipalities with practical strategies for interim and final street transformations.

A crucial step in street transformation, interim implementations use easily obtainable, flexible materials provided by municipalities to create temporary interventions. These projects utilize tactical urbanism tools and actively engage communities in the design process. Interim implementations allow municipalities to test project effectiveness before moving to final, permanent transformations by collecting pre- and post-implementation data. Final interventions, in contrast, often involve removing hard surfaces, incorporating sustainable, permeable materials, and introducing greenery to create resilient, climate-friendly public spaces.

Each year, the program opens a call for applications, selecting municipal teams that bring together multiple departments—including strategic development, planning and projects, transportation, and parks and recreation. These interdisciplinary teams participate in a six-month learning program, where they gain expertise in street design fundamentals and tactical urbanism, collect data, and develop plans for interim interventions based on their findings. After implementing these interim interventions, they reassess data, refine designs, and proceed with final transformations backed by greater financial resources.

By bringing together municipalities of different sizes and from various cities, each program cohort fosters collaborative learning, similar to urban planning education. This peer-to-peer exchange strengthens problem-solving skills and knowledge-sharing among teams. Additionally, MMU's Mentor Program enhances this process by connecting different cohorts, allowing experienced municipalities to share their insights and lessons (un)learned with newcomers.

To date, the Reclaiming Streets Program has engaged 16 municipalities across the Marmara region, successfully transforming 15 streets in five cities through tactical urbanism-based interim interventions—one of which has evolved into a permanent transformation. These interventions have significantly improved urban environments by enhancing safety, accessibility, and inclusivity for residents.

Beyond equipping cities with essential skills and knowledge, the program plays a pivotal role in strengthening urban resilience and fostering a people-centered approach to street design. This paper will examine the tangible outcomes of these efforts, highlighting both successes and setbacks. It will explore the effectiveness of tactical urbanism as a complementary strategy to long-term city planning and assess how local, small-scale interventions can serve as catalysts for broader regional transformation.

Additionally, the paper will investigate whether short-term tactical interventions can evolve into sustainable, long-term urban solutions. Another key question it will address is: Can urban planning education extend beyond academia and seamlessly integrate into professional practice through hands-on learning programs that culminate in real-world transformations?

Keywords:

Child-friendly cities; street transformation; tactical urbanism; local action

SS_20 CHANGING THE STREET-SET: FROM TACTICS TO STRATEGIES, FROM STREETS TO CITIES AND BEYOND / 1980**Designing Safer School Zones: Bridging Immediate Needs and Long-Term Urban Solutions****Author:** Beyza Gürdoğan¹**Co-author:** Hayrettin Günc²¹ *Superpool*² *Senior Program Manager***Corresponding Authors:** bgurdogan@superpool.org, hayri.g@gmail.com

Change is rarely straightforward and is often met with resistance, especially in complex urban settings. To address these challenges, cities are increasingly adopting tactical implementation methods—small-scale, testable interventions that are backed by data-driven insights. These approaches allow for real-time testing, evaluation, adaptation, and appropriation, providing the evidence needed to drive larger, transformative urban solutions.

Superpool, a research-based design studio, collaborates with municipalities to apply these strategies, creating safer, more accessible streets for children, families, and communities. In partnership with the Istanbul Metropolitan Municipality's Directorate of Transportation, Superpool conducted a comprehensive field study to advance the Safe School Zones Policy and assess safety conditions around Istanbul's school streets. The study, encompassing 43 public elementary schools, 73,830 students, and 1,844 parents, revealed alarming infrastructure deficiencies: 44% of schools have sidewalks narrower than 1.8 meters, and 53% lack essential crosswalks, intensifying safety risks. Despite 72% of caregivers preferring walking as a convenient and affordable option, only 10% feel that current conditions make it a safe choice. The daily congestion surrounding Istanbul's primary schools—marked by overcrowded streets, traffic gridlock, and parents navigating through moving vehicles with their children—underscores the critical need for safer school zones.

Designers act as mediators in implementing tactical interventions guided by robust data collection and analysis. Superpool, leveraging its extensive field research, translates raw data into actionable, context-sensitive solutions. Through collaboration with multiple cities, the studio serves as a facilitator, aligning community needs with municipal objectives to develop scalable, evidence-based interventions. These interventions empower designers, policymakers, and communities to co-create school streets as safer, more inclusive public spaces. Agile, data-driven strategies enable interventions to remain responsive to local needs while fostering long-term urban improvements.

Furthermore, research-based design studios play a significant role in integrating tactical interventions within broader policy frameworks. By linking immediate safety concerns with long-term urban development goals, such studios may contribute to the development of adaptive and scalable strategies that promote equity and sustainability. However, it remains open to discussion whether designers can effectively mediate between short-term solutions and systemic change, and how they might contribute to the creation of more inclusive and sustainable urban environments in the process.

Keywords:

Tactical Urbanism; Safe School Zones; Data-Driven Design; Designer as Mediator

Special Session 21 | INNOVATING PLANNING EDUCATION IN THE AGE OF AI EMERGENCE

SS_21 INNOVATING PLANNING EDUCATION IN THE AGE OF AI EMERGENCE / 2077

The age of Artificial Intelligence and education with humanism

Author: Qingyuan Guo¹

¹ *London School of Economics*

The rapid development and application of artificial intelligence (AI) has radically transformed our conception of planning and what the planning profession can achieve. AI has enabled new, and in many cases more accurate, ways to make predictions, more efficient design modeling, and streamlined data gathering. When used appropriately, AI can contribute to more robust decision-making, revealing its vast potential as a tool capable of achieving outcomes that were previously unattainable or too resource-intensive to accomplish. For planning education, this presents a clear imperative: to teach students how to use AI to solve problems, emphasizing AI's role as a tool.

However, the mission of planning educators goes beyond simply teaching students technical know-how. As John Dewey argued, education should be about helping students realize their potential—developing their capacity for situational problem-solving that aligns with their personal goals. To clarify the type of capacity we are referring to, it is helpful to invoke Aristotle's typology from *Nicomachean Ethics*. Aristotle differentiated between two types of wisdom: technical wisdom (*techné*), which focuses on using tools to achieve a specific end, and practical wisdom (*phronesis*), which is about determining the right ends and choosing the appropriate tools to use in a given situation.

Teaching students how to use AI to achieve specific goals clearly falls within the realm of technical wisdom (*techné*). Yet, the rise of AI also provides educators with the opportunity to foster the development of students' practical wisdom (*phronesis*). The development of practical wisdom—making sound judgments about what is right in a given situation—has long been advocated as something best achieved through case-based pedagogy, as demonstrated in programs like those at Harvard Business School. In this context, AI creates new possibilities for more efficient, tailored case-based simulations that can meet the specific needs of planning curricula.

A central question, however, is whether AI-generated case studies can effectively simulate real-life situations. Drawing on Herbert Simon's pragmatist ideas on simulation, this presentation argues that even if AI-generated cases are not perfectly realistic, they can still serve valuable pedagogical purposes if properly supervised by experienced educators and tailored to meet specific learning objectives. The emphasis on AI's capacity to generate case studies is not intended to replace teaching students how to use AI but to complement it.

To strengthen planning as a professional discipline, it is essential to provide students with both the general professional knowledge required to use AI and the practical wisdom to make informed decisions in their professional and personal lives—whether or not AI is involved. This balanced approach will ensure that future planning graduates are not only skilled in using advanced tools like AI but are also capable of exercising judgment and making wise decisions in the increasingly complex real-world situations they will face.

SS_21 INNOVATING PLANNING EDUCATION IN THE AGE OF AI EMERGENCE / 2074

Positive Energy Districts, Energy Communities and AI: Synergies, Contrasts, and Benefits for Urban Energy Systems and Areas

Author: Daniele Vettorato¹

¹ *Eurac Research*

Corresponding Author: danielle.vettorato@eurac.edu

Urban energy systems are undergoing profound structural transformations driven by decarbonization policies, digitalization, and demands for more democratic and inclusive governance. In this context, Positive Energy Districts (PEDs) and Local Energy Communities (LEC) have emerged as key paradigms in the pursuit of climate-neutral cities. PEDs aim to generate more energy than they consume through spatially integrated design, technological efficiency, and centralized coordination at the district scale (Casamassima et al., 2022); (Kvasnica & Vařková, 2022). In contrast, (Local) Energy Communities prioritize citizen empowerment, local ownership, and collective management of renewable energy resources, operating through decentralized, often bottom-up governance structures (Volpe et al., 2024).

At the same time, Artificial Intelligence (AI) is becoming increasingly embedded in urban energy planning and operations. AI tools are used to monitor, simulate and optimize energy flows, forecast consumption patterns, and support real-time decision-making (Han et al., 2023). These technological developments are not value-neutral: they reshape power dynamics, influence design processes and raise new ethical and regulatory challenges for planners.

This paper critically examines the tensions and complementarities between PEDs, Energy Communities, and AI systems. These converging trends are reshaping the competencies and roles required of urban planners, calling for an urgent rethinking of planning education. Traditional curricula often remain siloed, technocratic, and insufficiently responsive to the complexity of today's urban energy landscape. There is a pressing need to equip future planners with new forms of literacy—energy literacy, digital literacy, and socio-technical systems thinking—that enable them to work across disciplines, engage with communities, and navigate uncertainty (Gondeck et al., 2024); (Kozłowska et al., 2024).

The contribution argues that integrating these paradigms into planning practices is not merely a technical update, but a paradigm shift in how planning itself is taught and practiced. Preparing planners to mediate between centralized and decentralized energy logics, to critically engage with AI tools, and to foster socially just transitions is essential to building sustainable, inclusive, and resilient urban futures.

This work is carried out within the European project DUT 4A4PEDs - DUT Joint Call 2023 - "MUR funding, application code DUT23_00117".

Innovating Planning Education in the Age of AI: Bridging Technology and Urban Futures

Author: Paulo Silva¹

¹ *University of Aveiro, Department of Social, Political and Territorial Sciences*

Corresponding Author: paulosilva@ua.pt

As artificial intelligence continues to reshape industries and societies, the field of urban planning stands at a transformative crossroads. In this presentation, Paulo Silva will explore the integration of AI into planning education, emphasizing its potential to revolutionize both pedagogical approaches and practical applications. By addressing questions such as how planners can harness AI to tackle complex urban challenges and how educational institutions can prepare future professionals to engage critically and ethically with these technologies, Silva will outline a vision for a forward-thinking curriculum.

The talk will also highlight real-world examples and case studies where AI tools have been successfully incorporated into urban planning practices, demonstrating their implications for governance, sustainability, and community engagement. Attendees will gain insights into the skills and competencies needed in this rapidly evolving landscape, ensuring that planning education remains relevant and impactful in the age of AI.

SS_21 INNOVATING PLANNING EDUCATION IN THE AGE OF AI EMERGENCE / 2078

Innovating Planning Education in the Age of AI Emergence

Author: Sila Ceren Varış Husar¹

¹ *Slovak University of Technology*

The rapid emergence of artificial intelligence (AI) has strongly impacted various fields, including education, reshaping how students and educators approach knowledge creation and application in urban planning. In planning education, AI is increasingly being integrated into student work, from writing assignments to the visualization of future-oriented studio projects. While this presents vast opportunities, it also introduces critical challenges that educators must address proactively.

Instead of enforcing restrictive rules against AI use, educators could think of adopting open communication with students, encouraging them to critically evaluate the knowledge and outputs generated by AI tools. Teaching students how to identify biases, inaccuracies and limitations in AI-generated content equips them with the ability to use AI as a supportive resource rather than a sole authority. However, prevalent reliance on AI for tasks like writing poses the risk of diminishing essential skills such as literature reviewing, critical reasoning and effective communication. Moreover, the use of AI in visualization

and depiction tools for studio projects has transformed how students convey their visions for future spaces in between scales. While these tools comparatively simplify the process of conveying ideas, educators must remain cautious about understanding the capabilities and limitations of such technologies. Lecturers play a fundamental role in guiding students to control these tools in ways that enhance creativity and critical thinking, ensuring that AI complements rather than replaces the intellectual consistency of planning processes.

Pioneering Intelligent Design for Future Cities

Author: Siegfried Zhiqiang wu¹

¹ *Tongji University*

The presentation highlighted a comprehensive framework encompassing intelligent diagnostics, simulations, configuration, and creative design. From enhancing water security and ecological resilience in Wuhan to optimizing spatial layouts and generating innovative urban features, the talk demonstrated how AI empowers urban development with precision, efficiency, and sustainability.

Wu detailed cutting-edge applications, such as AI-driven ecological network simulations to mitigate urban heat islands, intelligent land value forecasting, and the configuration of innovation-centric spaces. By leveraging over 10,000 AI tools across 12 urban design stages, the team exemplifies how AI is not only augmenting traditional design processes but shaping a new paradigm for intelligent, adaptive, and human-centric urban environments.

This visionary discourse underscores AI's potential to craft smarter cities and invites global collaboration in the ongoing pursuit of future-ready urban design solutions.

Track 1 | POSTGROWTH URBANISM

T_01 POSTGROWTH URBANISM / 1633

Community ownership for degrowth

Author: Daniel Fitzpatrick¹

Co-authors: Milly Warner¹; Pablo Sendra¹

¹ *Bartlett School of Planning*

Corresponding Authors: pablo.sendra@ucl.ac.uk, d.fitzpatrick@ucl.ac.uk, emilycharlotte-warner@gmail.com

In our research, we started looking at community ownership as specifically geographically defined communities having democratic control and ownership over land and buildings. In line with their long-term stewardship role, community landowners manage properties and dedicate their surpluses for the benefit of residents, other occupiers, as well as the wider community, and the environment. Community ownership and stewardship activities have been linked to affordable housing, or social infrastructures. We were interested in looking at the larger scale community ownership of a range of assets beyond land and housing, interested in deriving a set of principles for community ownership.

In doing so, we learnt about the value and potential community ownership has for postgrowth planning. Both through direct decommodification, there are important secondary effects in terms of community organizing, a focus on community health and wellbeing, generation of local employment, as well as climate change resilience. If we consider postgrowth to be the decoupling from market-based paradigm, along with the decoupling from carbon emission as well as reduction of throughput of resources along with the addressing of social and ecological (Savini 2022) then community ownership of a large range of different assets can be considered both as a set of prefigurative practices to inspire and replicate, but also able to generate the institutional infrastructures for scaling up.

Our paper presents the cases we looked at across the UK including the community ownership of land, housing, energy, transport, data, town centres, community centres, pubs, forests and agricultural projects –which spanned a large and diverse range of land-uses as well as activities. Through interviews with groups as well as umbrella support organisations, we developed a set of common principles for community ownership based on the notions of community being articulated and used, the sense of place, the diversity of scale, role of finance, importance of business models and revenue generation, forms of governance, value generation, and the policy as well as regulatory frameworks. What we would like to explore in this paper is the role these principles have in formulating community ownership as integral to postgrowth planning framing the relational and place-based approach needed for community ownership as part of a broader set of spatial planning and regeneration practices.

Post-growth planning is a call for focusing on wellbeing and health while staying within the planetary boundaries in a long-term perspective. We observe an increasing academic interest in the connections between post-growth or degrowth and infrastructure planning in academia, and now also in practice in countries such as the Netherlands. Infrastructure providers themselves are publicly exploring, through research and public debate, their role in a possible transition to a post-growth society and how they can use their existing instruments and tools to facilitate this transition. First tentative seeds underline a shifting self-understanding of infrastructure planning. Despite such potentials, “infrastructure studies represent a domain [...] significantly uncharted amongst degrowth scholars” (Pansera et al., 2024, p. 1). Post-growth has yet to make its way into the literature and practice of transport infrastructure planning, especially at the city-wide and supra-local level of larger infrastructure networks and their future transformations at large. We recognize this opening window of opportunity for utilizing post-growth planning to discuss and reposition the role of infrastructure providers and planners situated within them.

Ecopolis. What does a post-growth city may look like?

Author: Silvio Cristiano¹

Co-author: Sandro Fabbro²

¹ *Università degli Studi di Firenze*

² *University of Udine*

Corresponding Authors: sandro.fabbro@uniud.it, silvio.cristiano@unifi.it

Ecopolis. What does a post-growth city may look like?

In the second decade of the century, Espon, the European Agency for territorial studies, conducted scenario studies on the future of the European city, examining three major

scenarios respectively named: Metropolis, Metapolis and Ecopolis. We consider that study still valid but currently it seems to have a weaker meaning as Espon aimed to synthesize them. From our perspective, it seems more preferable to choose and promote, among the three, the most just and sustainable one. We call this proposed model: the post-growth city. This cannot be a “fossil city”(Malm) based on the infrastructures of the fossil world; nor a city based on strong social, economic and power hierarchies, the unjust city (Harvey); nor a city dominated by alienation and a sick relationship between humans and nature (Latour).

At the same time, it must be capable to face all the contemporary challenges (Seto). The fundamental questions for a spatial planner consequently are: what dimension has this city? What shape? What economic structure?

First of all, it should be said that the city is no longer an “economic machine” like the Fordist metropolis (Metropolis), but not even an infrastructure to support traffic, mobility and logistics (Metapolis). The post-growth city is an ecosystem that balances human development and planetary sustainability. It must be, therefore, a living organism, in which humanity reconnects with the rest of nature and works collectively to build a more human and just future. In our research we propose the name of Ecopolis (Fabbro). The physical and social space of Ecopolis includes anthropic components (settlements), semi-natural spaces (for agriculture) and natural spaces (rivers, forests, meadows, etc.). It is supported by a dominance of vegetal and water ecosystems over the built environment. It is neither hierarchical nor monocentric and, therefore, has no single center and large peripheries but different structures.

Its form is ‘organic’ i.e. following the shape generated by its dominant geophysical (valleys, slopes, basins, the course of a river, coasts, uniform plains, etc.) and natural components (climate, air, sun exposure). It aggregates around or within a large natural ecosystem (a much biodiverse river, a valley system, etc.). Its metabolism is inspired on ecological dynamics, thus encouraging the flourishing of buffers (lakes, forests, other ecosystems) and harmonizing energy, and resource in and outflows to meet strong forms of sustainability and resilience, safeguarding the basic, vital functioning of spatial systems in the event of resource availability oscillations.

Its political economy can no longer be capitalist, not even in its most softened conceptions. Its political economic model is, coherently with its structure and shape, post-metropolitan (Soja), post-growth (Savini) and post-capitalist (Kohei). This does not mean that capitalist companies and market exchange no longer exist; they are rather not dominant. It implies a tripartite model (Polanyi) made up of (i) market regulation to avoid their excessive expansion, (ii) protection of land, people and labour from the destructive effects of commodification, (iii) promotion of forms of social economy closer to people and the Earth. Who builds this city-territory and how? It implies a broader reterritorialization capable of calling into question all the generative parameters of the modern city concept. It will therefore be necessarily reconstructed on the basis of a community ethos. Is Ecopolis a utopia? No, because Ecopolis already exists in many parts of the world but is suffocated by the effects of the “planetary urbanization” (Brenner). It must be recognized, made to re-emerge and be valorized.

T_01 POSTGROWTH URBANISM / 521**Planning for conviviality****Author:** Luca Bertolini¹¹ *University of Amsterdam***Corresponding Author:** l.bertolini@uva.nl

Modern urban planning was born and consolidated as a means of managing, and thereby facilitating, urban and economic growth. The recent shift to the pursuit of 'sustainable' or 'green' growth still accepts this basic orientation. Today, emergent, 'degrowth' and 'post-growth' planning are instead fundamentally questioning the focus on enabling growth, in whatever form, following the acknowledgment that there are intrinsic, inescapable connections between the pursuit of growth and current social and environmental challenges.

Degrowth and post-growth planning are, however, faced by a dilemma. On the one hand, degrowth and post-growth planning narratives, while compelling, struggle to mobilize broad constituencies and impact planning practice. On the other hand, less compelling sustainable and green growth planning narratives, appear more appealing and applicable to many. One way out of this dilemma is the development of more broadly mobilizing and more readily applicable degrowth and post-growth planning narratives. Such narratives would still have to be firmly rooted in the acknowledgment of the entanglements of current social and environmental challenges with the pursuit of urban and economic growth, but at the same time, they would have to be able to convey hope to a broad public and generate concrete options for planners aiming at 'better places'.

I claim that Ivan Illich's 1973 'Tools for Conviviality' can provide one powerful inspiration for such a narrative, following recent applications in other fields, most notably in technology and energy. Illich was well-aware of the dilemma sketched above. He did not believe that a majority opposed to growth was feasible, or that an antigrowth minority, while feasible, was desirable. Rather, he saw a way out of the dilemma in the substitution of the dominant logic of industrial productivity with an alternative logic of 'conviviality', which he defined as the "autonomous creative intercourse among persons, and of persons with their environment". One essential notion he advanced is the distinction between two phases in the development of tools (technologies, institutions): a first, in which they are primarily means for the empowerment and liberation of individuals, and a second, in which they become primarily self-referential ends, ultimately oppressive and enslaving of individuals (as illustrated in, e.g., transport by the shift from bicycles and motorized public transport to mass automobility). A second, related essential notion is the need for continuous, democratic deliberation about, and scientific inquiry in the opportunities for new tools entering the first phase, and the risks of existing tools entering the second phase.

In this paper, I explore and articulate how both Illich's criticism of industrial productivity and his pursuit of conviviality can provide directions for a mobilizing, applicable narrative for planning beyond growth. I illustrate the argument with concrete examples from the topical domains of planning for mobility, housing, and energy, in their place-based interrelations, and discuss connections with similar undertakings in other fields.

Restoring socio-ecological balance in City-Port Areas. A conceptual framework for a circular and sustainable regeneration of coastal wastescapes integrating Nature-Based Solutions

Author: Libera Amenta¹

¹ *DiARC, University of Naples Federico II*

Corresponding Author: libera.amenta@unina.it

Research context

City-Port Areas (CPA) can be defined as multi-risk exposed environments characterized by high-complexity (Hein, 2016, 2018, 2023) and facing diverse intertwined challenges related to overlapping environmental, natural and anthropic risks. They are the first to experience the impact of climate change, being affected by resource scarcity and linear urban metabolism processes, showing difficulties to grow within socio-ecological limits and ecosystem boundaries. These challenges, that characterize the capacity of today's CPA to be future proof, are interconnected to the problems related to the supply of energy and materials, and to the availability of land for agricultural purposes and further developments.

Land in CPA is a scarce resource if connected to linear and thus unfunctional urban and territorial metabolisms as well as to unsustainable processes of growth. However, CPA are prone to become hot spots and hubs of innovation and incubators for circular solutions based e.g. on mitigation and adaptation measures (AIVP, 2018, 2021) and on regeneration processes through nature-based solutions (NbS) applied in the context of wastescapes (Amenta and van Timmeren, 2018).

Conceptual and methodological framework

To understand how to implement a transition towards circularity and sustainability for CPA, this contribution presents the methodological approach of the research SPArTaCHus (financed within the framework: "Programma per il Finanziamento della Ricerca di Ateneo FRA 2022", of the University of Naples Federico II, Corresponding proponent: Libera Amenta).

SPArTaCHus proposes a mixed method that combines insights from urban ecology, urban metabolism, ecological urbanism, and more-than-human perspectives for the regeneration of their wastescapes, understood as a system of underused or abandoned territories crossed by resource flows. To define circular strategies for alternative scenarios to cope with the intertwined contemporary challenges of CPA, this research emphasizes the urgent need to strike a balance between environmental goals, social equity and justice.

SPArTaCHus interprets CPA as promoters of circular and sustainable prosperity in equilibrium with nature through the adaptive management of their natural habitats. Being transitional landscapes, CPA both face ever-changing challenges from e.g., port activities, and offer a rich socio-cultural environment. Understanding the complex dynamics of CPA informs a path toward circularity, that can reconnect people, spaces, flows, economies, and ecologies.

Project's ambition

Research on City-Port Areas allows to move from local to global and back, understanding ports as knots (Lobo-Guerrero & Stobbe 2016), towards the multidisciplinary, multiscale and integrated concept of territorial metabolism (Grulois, et al. 2018). In this way, it is possible to focus on the mutual relationships between human activities, resource use and the effect of these activities on the built and natural environment, including the countryside, for boosting a sustainable and different kind of growth, and looking for design-driven strategies for implementing innovation in urban and social agendas (IABR, 2014). Implementing circular urban metabolism and economy principles can help create regenerative territories that operate within the planet's safe and just limits. Understanding that CPA are characterized by land scarcity and large amount of wastescapes, the project aims to set design and planning guidelines for a regenerative approach by working on soil resources that are often degraded, polluted or abandoned due to many factors, among which port-related activities which concluded their lifecycle. Wastescapes in CPA can be seen as the result of a linear process of an unequal growth,

as the port and the city follow different logics and planning time. This contribution critically examines how NbS can tackle the complex multi-risk challenges faced by CPA, using Rotterdam as a case study to highlight both the opportunities and challenges associated with circular transitions.

Urban Metabolic Risk: Rethinking Circular Urban Metabolism for Sustainable Regeneration Processes

Author: Bruna Vendemmia¹

Co-authors: Federica Vingelli¹; Libera Amenta¹; Michelangelo Russo¹

¹ DiARC Università degli Studi di Napoli Federico II

Urban metabolic risk refers to the cumulative negative impacts of urban metabolism, which undermine quality of life and create significant challenges for urban regeneration initiatives. In the context of post-growth urbanism, this concept offers a lens to explore how urban metabolisms can be reconfigured to sustain ecological balance and social equity, moving beyond growth-driven models of development.

This paper aims to define the different factors that determine urban metabolic risk by analyzing the case of Bagnoli-Coroglio, a multi-risk contaminated Site of National Interest (SIN) in Naples, Southern Italy. Bagnoli, historically an agricultural area that became an industrial hub in the late 19th century, exemplifies the socio-ecological disruptions driven by unsustainable urbanization. The closure of industrial activities in 1990 left behind severe soil and sea pollution and social fractures due to unemployment and loss of

identity; furthermore, the area has been waiting for a reclamation project for almost 40 years, making the site a paradigmatic example of metabolic risk.

Urban metabolic risk is not limited to the inefficiency in managing material and resource flows in cities and between urban and rural contexts at a regional level, but also considers the rebalance of human-nature relation, encompassing the broader alienation of humans from the natural environment, as conceptualized by Marx's metabolic rift (Moore, 2000). This rupture accelerates ecosystem degradation (Heynen et al., 2006), exacerbates socio-economic inequalities, and intensifies urban vulnerabilities, particularly in marginalized communities. While ecological dimensions of the metabolic rift are well-documented (McClintock, 2010), this paper emphasizes the often-overlooked social and political dimensions that hinder equitable regeneration processes.

By analyzing the site of Bagnoli-Coroglio, this research aims to identify and map the factors that contribute to metabolic risk and to define the planning tools, such as participative governance and circular planning models that may help mitigating urban metabolic risk while allowing more inclusive and environmentally sustainable urban systems. This study is part of the PE3 -RETURN project Task 5.4.4 - Circular Metabolism in Urban and Metropolitan Settlements.

Post-growth Redefinition of Urban Textures: The Changing Faces of Human Scale through Eminonu and Maslak Central Business Areas in Istanbul

Author: Dila Toprak¹

Co-author: Eren Kürkcüoğlu²

¹ *Sunum Yapan Yazar - Kendisi*

² *Ortak Yazar - Tez Danışmanı*

Corresponding Authors: toprak17@itu.edu.tr, ekurkcuoğlu@itu.edu.tr

As cities move beyond growth-focused models, the connection between urban texture and human scale offers a clear way to design spaces that put people first. Historically, urban growth has often prioritized economic expansion and infrastructural development, leading to dense and sprawling urban forms. While this growth facilitated economic wealth and connectivity, it frequently resulted in the erosion of human scale which is the proportion and spatial qualities of urban environments designed to be comprehensible and comfortable for individuals. People's perceptions of urban life are greatly influenced by the layout of streets, buildings, and open areas. There has been a noticeable shift toward bigger and more standardized building designs that dominate the skyline in cities where growth has been the main priority. These frequently connect with broader streets that are primarily designed to accommodate vehicular traffic. As a result; the

sense of place, the sense of enclosure, and key features of spaces designed with human proportions are increasingly being lost. In post-growth urban contexts, re-establishing human scale involves rethinking the spatial relationships between cities and their residents. Narrower streets, diverse building typologies, and well-integrated public spaces are pivotal in creating environments that prioritize pedestrian movement, encourage social interaction, and enhance overall urban livability. The shift from growth to human-centered design also emphasizes quality of life over sheer expansion and contributes to the creation of inclusive and resilient cities.

This paper aims to explore how contrasting urban forms can inform the principles of post-growth urbanism over two extreme points of a grown and developed Central Business District axis of Istanbul: Eminönü (historical core with pedestrian-friendly organic streets) and Maslak (modern period development with vehicle-oriented streets and high-rise buildings). By examining these two abroad districts, the study uncovers how urban design choices shape not only physical spaces but also the social and experiential dimensions of city life. Comparative spatial analyses which are carried out within the scope of the study investigate the critical role of human scale in fostering walkability, social interaction, and a sense of community: Eminönü exemplifies the potential of human-scaled environments to enhance inclusivity and connectivity, while Maslak underscores the challenges of prioritizing economic expansion over social cohesion. This paper also proposes a framework for regulating urban density based on morphological parameters such as street width, building height, and street enclosure. The findings reveal that urban spaces designed with higher levels of street enclosure and balanced building proportions, as observed in Eminönü, enhance social interaction, a sense of place and community, fostering more inclusive environments. Conversely, Maslak's vehicle-oriented design and high-rise dominance highlight the limitations of growth-focused urbanism, emphasizing the need for a paradigm shift. By grounding theoretical perspectives in practical solutions, this study underscores the transformative potential of human-scale design in shaping resilient and equitable urban environments, offering clear strategies for urban planners to prioritize quality of life over expansion.

T_01 POSTGROWTH URBANISM / 919

Post-Growth Paradigms Underpinning the Socio-Technical Transformation of Services: An Analysis of Three Municipal Planning Strategies in the Atlantic Region

Author: Lucia Cerrada Morato¹

¹ *Institut Metròpoli*

Corresponding Author: luciacmorato@gmail.com

The development of urban infrastructures and services has historically followed a growth-oriented, path-dependent model, particularly in medium- and small-sized municipalities in peripheral European regions (Kirkpatrick & Smith, 2011; Næss, 2006). This trajectory, often reinforced by structural and economic changes linked to European Union integration, faces increasing challenges from environmental, social, and financial crises (Schneider et al., 2010; Jackson, 2009). These crises necessitate rethinking planning frameworks to address the unique constraints of medium-sized municipalities, often overlooked in favour of metropolitan and capital cities.

Post-growth and degrowth scholarship (Kallis, 2018) offers alternative approaches, emphasizing the need to decouple urban development from economic growth. While this

research explores pathways for infrastructure transformation, particularly in housing, transport, and networked services (Savini & Bossuyt, 2022; Durrant et al., 2023), most studies focus on large cities (Demaria et al., 2013; Cerrada Morato, 2024). Consequently, the dynamics of medium-sized municipalities, including their ability to adopt and implement post-growth principles, remain underexplored (Cerrada Morato, 2025). Addressing this gap, our study examines the intersection of post-growth paradigms and the planning tools used to drive socio-technical transformations in these contexts.

Using a socio-technical lens (Geels, 2005), we analyze three medium-sized municipalities in a peripheral European region undergoing service transformation. Each municipality operates under a distinct post-growth paradigm, providing insights into how these paradigms influence the design and implementation of transformation strategies. Our findings reveal that opportunities for socio-technical innovation and adaptation are deeply tied to the guiding post-growth paradigm, highlighting the importance of context-sensitive approaches.

Bringing conceptual clarity to the post-growth debate is critical for advancing theoretical and practical urban planning frameworks. Recognizing the diversity of post-growth paradigms and their interconnections is essential for avoiding one-size-fits-all solutions and fostering resilience in medium-sized municipalities. Moreover, this clarity supports the development of planning tools tailored to the specific needs of these municipalities, promoting equitable and sustainable service systems (Hodson & Marvin, 2010; Swilling, 2011).

This study contributes to post-growth discourse by emphasizing the value of context-specific strategies and advocating for a more inclusive approach that integrates medium-sized municipalities into academic and policy debates. It advances understanding of how post-growth paradigms drive socio-technical transformations in urban infrastructure and service provision, addressing critical gaps in theory and practice.

Reconfiguring Underutilised Spaces: A Conceptual Framework for Advancing Spatial Circularity in London

Author: Zhejun Wang¹

¹ *University College London*

Corresponding Author: zhejun.wang.23@ucl.ac.uk

The escalating challenges posed by resource depletion, urban sprawl, and socio-spatial fragmentation demand a rethinking of urban systems. While the circular economy (CE) has emerged as a paradigm to decouple economic growth from resource consumption, its urban applications often reduce circularity to technocratic resource management, neglecting the spatial and social intricacies of everyday life. This study critically synthesises the literature on local circularity, underutilised spaces, and circular design strategies, constructing a conceptual framework for understanding how underutilised spaces may serve as drivers of spatial circularity in cities, with a particular focus on London.

The review begins by interrogating the concept of local circularity, positioning it as a spatially grounded extension of CE. Local circularity represents a shift from macro-scale, resource-centric models to site-specific, community-embedded practices (Kocaturk and Hosseini, 2023). Unlike macro-level models dominated by material flows, local circularity emphasises neighbourhood-scale interventions that integrate spatial, material, and social dimensions. However, current scholarship and policy largely frame circularity through technical and systemic approaches, sidelining the socio-spatial and territorial implications critical to its realisation in everyday urban life. This review argues that local circularity is not merely an extension of CE principles but represents a profound reimagining of spatial resources at the local scale.

The second section interrogates the role of underutilised urban spaces as latent resources within the circular city. The second section focuses on underutilised spaces, conceptualising them not merely as voids or remnants of planning failures but as latent resources for enabling circular practices. Drawing on Carmona's typology of urban spaces (Carmona, 2010) and subsequent studies, this research critically analyses how these spaces - negative, ambiguous, and residual - represent both the 'dark side' (Kevin Lynch, 1990) of urbanisation and an opportunity to renegotiate the spatial logic of cities (GLA, 2022). By integrating theories of latent potentiality and circular regeneration, the review underscores how these spaces could be leveraged to foster resource efficiency, social inclusion, and localised circularity.

The final section examines circular design strategies as an operational tool for reconfiguring urban space. Rooted in the principles of eliminate, regenerate, and circulate, circular design connects material flows with spatial configurations and social practices (EMF, 2021). Circular design is not merely an aesthetic or functional exercise; it is a boundary-spanning process that aligns socio-spatial practices with ecological imperatives. By advocating for a systemic, design-led approach, this research proposes that strategies such as adaptive reuse and temporary interventions can transform underutilised spaces into vibrant nodes of circularity.

Building on these reviews, this study proposes a conceptual framework for spatial circularity, structured around three interrelated components: (1) local circularity as the core, providing the socio-spatial foundation for integrating CE principles into urban contexts; (2) underutilised spaces as resources, reframing them as latent assets for circular practices; and (3) circular design as the operative mechanism, operationalising spatial circularity through tangible interventions. This framework synthesises diverse theoretical perspectives while offering a structured lens to guide future research and practice. This study contributes to the discourse on circular cities by addressing the underexplored intersection of CE and urban spatiality. The proposed framework reconceptualises space as the critical interface linking material flows, governance systems, and everyday practices, embedding circularity within the socio-spatial fabric of urban environments (Williams, 2021). By addressing theoretical gaps, it provides a structured pathway for operationalising CE principles through spatial interventions, particularly in underutilised urban areas in London and beyond. Future research must critically engage with the empirical and contextual dimensions of this framework to validate its adaptability across diverse urban settings.

Toward New Circular Urban Economies: Regeneration Models for the Ecological Transition of Cities. European Cases and Initiatives.

Author: Chiara Moretti¹

Co-authors: Roberto Bologna¹; Giulio Hasanaj¹

¹ *University of Florence, Department of Architecture*

Corresponding Authors: giulio.hasanaj@unifi.it, chiara.moretti@unifi.it, roberto.bologna@unifi.it

At a time when climate change is showing its destructive force, with record high temperatures and environmental catastrophes, we need to look for an alternative approach to the current one that rethinks cities as living organisms and optimises processes rather than products, paying close attention to the management of urban flows so as to develop a more efficient urban metabolism.

In urban contexts, the linear management of resources (water, food, materials, energy) represents a development model that is no longer sustainable as it contributes significantly to aggravating environmental problems such as **resource depletion, ecosystem degradation, biodiversity crisis and loss of natural capital**.

It is possible to decouple economic growth from the use of resources and the environmental impacts they cause. This can be achieved by replacing the prevailing linear growth models with regenerative and circular models for the preservation and enrichment of urban ecosystems and biodiversity. To combat climate change and **reverse the current linear development model**, it is necessary to reconvert our production and consumption systems with appropriate economic, social, political and technological changes that go beyond conservation and restoration practices, in the direction of a paradigm shift in the way we produce, use and reuse products and resources (IPBES, 2019) **moving from an anthropocentric to an ecosophical vision** that shifts the focus from human beings to the ecosphere, integrating environmental, social and mental ecology for the creation of communities integrated with nature.

The article presents a scientific position with respect to the issues raised from an exhaustive screening of the scientific literature, technical policy reports, and research results at the European level, the paper maps and analyses **demonstration projects of urban regeneration with a circular transition perspective** that allows the definition of intervention scenarios marked by a renewed conception of urban planning characterised by the circularity of material and immaterial resource flows. The article discusses an alternative position in the debate on circular cities with the aim of integrating the themes of circularity, Nature-based solutions, climate change, well-being and health, and urban development to support both ecological balance and social equity.

The paper presents the theme of the **Circular Urban Economy**, which, through a proactive approach, encourages cities to implement circular measures that address socio-economic inequalities, promote social cohesion and improve access to urban resources, services and green and blue spaces. To this end, the article explores urban transition processes according to the principles of regenerative design, reinforcing the role of nature and the recirculation of local resources to transform degraded urban areas into ecosystems that enhance biodiversity, contrast climate change and improve the well-being and health of citizens. The main aim is to clarify **the role of architectural and urban design in the circular transition of cities**. In particular, through the analysis of selected case studies, the paper identifies the effectiveness of urban practices in which circularity is developed beyond purely economic interactions and eco-efficiency parameters, helping to define the potential of a circular degrowth city centred on inclusiveness, social justice and reciprocity. Circularity is not meant to be the final goal, but rather a tool to **create healthier, more inclusive and regenerative urban communities** that rely on closed material cycles to reduce their environmental footprint.

The article allows us to extrapolate a catalogue of technological and spatial solutions to be implemented in experimental design applications to guide the planning and sustainable design of future cities.

Navigating Regional Gaps, Cohesion Policy, and Geostrategic Security: Balancing Estonia's Urban System

Authors: Antti Roose¹; Veiko Sepp¹

¹ *University of Tartu*

Corresponding Authors: antti.roose@ut.ee, veiko.sepp@ut.ee

The paper explores regional gap scenarios balancing society-economy-environment domains amidst escalating uncertainties. The study exemplifies multiscale peripherisation of Estonia at EU external borders, with a strong impact on the urban system of depopulation, green deal, and the geostrategic security agenda. The latter has still been understated and remote in regional and cohesion research and policy support despite ongoing tensions. Also, the importance of governing with intent is becoming the mainstream, with an understanding of the anticipated impacts of new strategies, business

models, services, for example, remote work, digitalisation and platformisation (Oldbury and Isaksson 2023).

The study analyses the aggregate impacts of the scenarios on Estonia's territorial development and cohesion, including impacts on economic development, social well-being, cultural prosperity, land use, environmental sustainability, as well as defence and security. Based on the key axis of regional gap-balance, four scenarios are set: A. Metropolisation, B. Dispersed regionalisation, C. Small cities, and D. Growing by immigration, which all include sprawling, dispersed, and compact sub-scenarios. The scenarios are assessed on their impact on resource needs, consumption changes, and environmental pressures at six types of urban regions in their core, suburban hinterland, and rural hinterland. Four scenarios are compared by land take, housing stock, infrastructure requirements, industrial and logistics estates, retail and services, and home-work, home-services mobility. The causal chains, key drivers, and triggers of shrinkage and the regional gap, as well as the key policy packages and regional support to make the scenarios a future outcome, are elaborated.

Since the 1990s, there has been a massive depopulation of many regions across Estonia, with urban growth supported by neoliberal planning and agglomeration increasingly shifting to the Tallinn metropolitan region. Regional polarisation shapes new residential, job, business, and service geographies driven by a rescaled urban system and agglomeration economics. Degrowth has multiple hidden and blurred territorial features amplified by fuzzy multilocality and networked if classic surveys and indicators are applied. Population trends continue to change significantly and potentially disrupt the structure of Estonia's urban system. Population projections for 2050 forecast that the majority of local authorities would see their populations decrease by more than a quarter, while 9 local authorities could experience a decrease of more than half. For Estonia as a whole, metropolisation (A) amplifies regional imbalances. The regional gap and peripheralisation manifest as economic and social inequalities. Regionalisation (B) is executed at the expense of hinterland counties and small cities. The small city scenario (C) preserves the historic county-based urban system, keeping and revitalising regional balances. Small cities also retain their vitality, and rurality is preserved with regional specialisation and optimal diversification.

As a controversial outcome of regional shrinkage, depopulation and degrowth may increase energy consumption, carbon footprint, infrastructure, and service costs. Supporting left-behind regions can alleviate population exodus and further metropolisation but requires massive and very precise policy intervention. Additionally, as an isolated international agenda, the radical policy for national security and regional resilience shifts requires significant trade-offs in cohesion and regional policy, supported by emerging planning discourses.

A new security and cohesion relationship with civic transparency should be positioned as a core element of regional planning, facilitating a shift away from a reactive, crisis response stance (Hunter, 2023). The basis for the strategic choices guiding the future urban system should be defined in the national spatial plan "Estonia 2050," aiming to define the territorial conditions for sustainability and a high-quality living environment throughout Estonia. The emphasis tends to highlight the 'left-behind' risks of re-regionalisation, with modelling, designing, and delivering multiple complex transitions for territorial cohesion, with integrity and an increasingly strong security dimension.

Towards the understanding of the energetic bases of spatial dy-

namics: an introduction for postgrowth planning

Author: Silvio Cristiano¹

¹ *Department of Architecture, Università degli Studi di Firenze*

Corresponding Author: silvio.cristiano@unifi.it

Although acritically reported as steadily galloping for the next decades, based on recent trends, global urbanisation is not exempt from either physico-ecological and social issues and related limits, just like the well-known ones dealt with by Meadows et al. (1972) and by Hirsch (1976). As a matter of fact, natural systems follow pulsing paradigms (Odum et al., 1995), with successions of growth, peak, and descent phases; acknowledging this, and consequently adapting to the right phase can make the “way down” prosperous (Odum & Odum, 2011). Prosperous is an adjective also related to the political proposal of degrowth (Kallis et al., 2012), which can be seen as a step toward a postgrowth societies (in the pulsing paradigm, theoretically this would not exclude novel growth phases in the future). More and more discourses are emerging around the concepts of postgrowth cities and postgrowth urbanism (Xue, 2022; Savini et al. 2023), often pursuing stronger forms of socio-ecological sustainability and resilience altogether (Cristiano et al., 2020). As a part of a stream of founding contributions in such a novel field, a transdisciplinary recognition is here offered to possibly understand the physico-ecological foundations of spatial dynamics, with a focus on human settlements and their relations with the rest of nature. More specifically, all of this is framed - qualitatively - in the systems thinking and diagramming notions behind the above-mentioned scientific literature and - quantitatively - in the systems designs that ecosystems and other self-organising systems develop to reinforce energy use (Odum, 1988), also resorting to the algebra of the eMergy theory (Odum, 1996), to the maximum power principle (Lotka, 1922) and to the maximum empower principle (Odum, 1988; 2002). On top of providing an unprecedented literature review bridging all of these topics in and urban and regional planning perspective, this study aims at producing new knowledge out of the reading of (human) spatial systems through these “hard science” lenses, also launching debates around the many possible extensive declinations of the concept of energy (after all complying with the notion of eMergy as a memory of energy and other resources), also including both “wealth” and basic livelihoods, crucially representing - this is one of our hypothesis - respectively drivers of competition in a growth phase and societal flows to try to secure in other times. Far from offering a complete scientific work, some research lines are here offered for dialectic use in the scientific arena - with a strong orientation toward the scholars of urban, regional, and landscape design and planning - towards a plural scientific toolbox to feed the emerging field of postgrowth urbanism with both “hard” and “soft” science inputs, and transdisciplinary ones.

Towards post-growth cities: the cultural politics of mobility transitions in Barcelona and London

Author: Elisa Schramm^{None}

Co-authors: Ariadna Romans I Torrent¹; Catarina Heeckt²; Imogen Hamilton-Jones²; Sofia Greaves²

¹ *University of Amsterdam*

Post-growth urban planning has in recent years begun to redefine urban development by foregrounding objectives beyond economic growth and towards social and ecological wellbeing. However, this emerging field has not yet considered the cultural politics that we argue are crucial in facilitating such a significant shift. This is particularly evident in the significant sociocultural and political tensions and contestations around recent progressive urban mobility initiatives.

To address this gap, we conduct ethnographic and archival research around the cultural politics of two contested mobility initiatives that we consider of interest from a post-growth perspective as ‘latent’ examples of post-growth (see Tsing, 2015): Low-traffic neighbourhoods (‘Liveable Neighbourhoods’) in Islington, London, and superblocks (superilles) in Eixample, Barcelona. Both have encountered backlash and political mobilisation against them, resulting in stalled and downscaled implementation of these ambitious initiatives. Although there are similarities in how, why and by whom these mobility interventions have been contested, they are also embedded in very different sociocultural, historic and linguistic national and urban contexts, producing distinct cultural politics of transitions that merit further study.

In this context, we foreground ‘the cultural’ as a key site of political struggles over meanings, hopes, visions and historical place attachments. We develop a more thorough account of what cultural politics means: Moving beyond a strong focus on values and imaginaries, as prevalent in post-growth (urban planning) literatures, we introduce an interdisciplinary framework of cultural politics that considers the confluence and tensions between urban planning histories, political imaginaries and affective attachments. In so doing, we argue for the importance of a more strongly humanities-informed approach to post-growth urban planning and transitions. Finally, we argue that contestation must be dealt with not only as impediments to overcome, but as integral and indeed indispensable part of (democratic) transformative processes towards post-growth cities. This in turn implies that there is a need for urban planners to (1) pay attention to cultural dimensions, loosely defined and including contradictory and messy elements, in both processes and ‘results’ of post-growth transitions and (2) to be radically open to uncertainty and emergence throughout such processes, embracing culturally diverse and variegated solutions for post-growth, refusing ‘cookie-cutter’ solutions.

T_01 POSTGROWTH URBANISM / 1782**Community-based Street Greening: A Postgrowth Approach to Resilient and Healthy Cities****Author:** Kristina Ulm¹**Co-authors:** Alec Thornton¹; David Sanderson¹; Evelyne de Leeuw²; Oona Morrow³¹ *University of New South Wales*² *Université de Montréal*³ *Wageningen University & Research***Corresponding Author:** k.ulm@unsw.edu.au

Caring for a garden bed along the street, where neighbors happily pick your herbs, may seem unimaginable for most urban inhabitants. However, in Sydney, Australia, public gardening practices have emerged, transforming bare public patches along roadsides into vibrant green spaces. By reimagining public space as a place for collective ecological and social regeneration, these practices challenge the growth-oriented urban development.

Urban gardening in underutilised public spaces, such as nature strips, can act as small-scale community gardens, enhancing individual and community health. These initiatives build social bonds, encourage outdoor exercise, and provide access to fresh herbs, vegetables, and fruits. Moreover, greening the streets improves planetary health by cooling local climates, increasing biodiversity, and providing habitats for urban fauna.

Through a comparative analysis of local government policies across Greater Sydney, this study examines how different regulatory frameworks support or hinder community-led street greening projects. Over seventy interviews with local government officials and community members shed light on the governance processes and highlight the role of street-level bureaucrats in executing policy decisions based on their views and experiences.

This case study provides actionable insights to future local public policy and citizen-initiated agendas for integrating nature-based solutions and fostering regenerative relationships between society and the environment. This research underscores the urgency of moving beyond growth-oriented development and adopting alternative approaches that prioritize people and the planet. In an age of planetary crisis, citizen-led public urban gardening offers a hopeful path towards resilient and equitable urban futures.

T_01 POSTGROWTH URBANISM / 1419**IS GDP EVERYTHING? ANALYZING GDP EFFECT ON DEVELOPMENT FOR TÜRKİYE PROVINCES.****Author:** Adem sakarya¹¹ *Yildiz Technical University***Corresponding Author:** asakarya@yildiz.edu.tr

Gross domestic product (GDP) is an important variable used to compare regions and countries as a welfare indicator. But is GDP everything? Post-growth and de-growth

approaches criticize the idea that solely focus on GDP growth. These alternative approaches, based on the unsustainability of unlimited growth, seek ways to ensure welfare, and sustainability and to conserve resources beyond growth.

This critical approach emphasizes the need to focus on development rather than economic growth. Indeed, while economic growth is measured through basic economic data such as GDP, development includes variables such as education, health, quality of life and innovation. In the literature, there are studies examining the impact of GDP on concepts such as human development index, welfare, and sustainability that post-growth and de-growth approaches focus on. However, such studies are quite limited in Türkiye

In relation to this, the main question identified in the study is whether the change in GDP at the provincial level in Türkiye is effective on the change in the level of development. The dependent variable is the change in level of development and the independent variable is the change in GDP.

Development data at the provincial level is taken from the socio-economic development index prepared on different dates. In this respect, the 2003 socio-economic development index prepared by the State Planning Organization and the index data prepared by the Ministry of Industry and Technology, General Directorate of Development Agencies in 2017, which is the current data, were used. The change in the development rank of the provinces among 81 provinces between 2003 and 2017 is taken as the change in the level of development, which is the dependent variable of the study. In terms of GDP change (dollar), the proportional change between 2004 data, which is the oldest data at the provincial level, and 2017 data is taken as the independent variable.

A two-stage method was applied in the study. First, the change in the level of development and the change in GDP were analyzed by mapping through geographic information systems. Secondly, linear regression analysis was applied to determine the effect of GDP change on the change in the level of development. Regression analysis is a statistical method used to examine the effect of the dependent variable on the independent variable. For the application of this method, the data must fit the normal distribution. In the normality analysis performed through the Statistical Package for the Social Sciences, it was seen that the data fit the normal distribution, and regression analysis was applied. According to the results of the analysis, the effect of GDP on the change in development level is not statistically significant. The average GDP increase of the 6 provinces with the highest decrease in development level ranking (11 and below) is 74%, while the average GDP increase of the other provinces that have a decrease in development level ranking (30 provinces) is 69%. On the other hand, the average GDP increase of the 8 provinces with the highest increase in development level ranking (8 ranks and above) is 77%, while the average GDP increase of the 30 provinces that have an increase in development level ranking (7 ranks and below) is 77%.

These findings show that GDP has no statistically significant effect on the level of development. Therefore, as a policy recommendation, it is important to focus on the welfare level, development, and sustainability along with GDP as emphasized in the literature.

Deprivation Analysis in Turkey and Its Provinces: Insights for Post-Growth Urbanism

Author: Abdalrahman T. Y. Alashi¹

Co-author: Özhan Ertekin¹

¹ *Istanbul Technical University, Turkey*

Corresponding Authors: ertekinozh@itu.edu.tr, alashi17@itu.edu.tr

This paper discusses the socio-economic and environmental deprivation patterns across provinces in Turkey by applying the English Index of Deprivation framework. In this study, data from TURKSTAT were used to assess disparities and determine the prime areas that need development interventions. The research underlines notable regional disparities by analyzing seven domains: income, employment, education, health, crime, barriers to housing and services, and the living environment, and provides a comprehensive deprivation map for Turkey.

This paper fits into the track on Postgrowth Urbanism, especially under the theme of envisioning cities and regions as integrated social-ecological systems. By applying the EID framework to Turkey, it contributes to the greater discourse on degrowth and equitable urban transformation. It challenges growth-oriented paradigms by calling for planning tools that would prioritize community needs, reduce environmental footprints, and nurture regenerative relationships between society and the environment.

This approach involves the translation of data from TURKSTAT into indicators defined by the EID, normalization, and categorization under component domains, followed by ranking using a multi-criteria weighted sum method. It thus offers a hands-on tool to policymakers, ensuring that decisions taken are based on evidence to stimulate fair development.

Results indicate striking contrasts between the most deprived southeastern provinces and the relatively less deprived far northwestern provinces. This disparity underlines the urgent need for an equitable resource distribution strategy in order to address structural inequalities. The research also emphasizes that one of the objectives of adopting a multidimensional approach in urban planning is to have growth metrics consider social equity and ecological balance.

The paper concludes by calling for the routine use of such analyses to facilitate competitive, sustainable, and equitable regional development. It highlights the transformative potential of deprivation analysis in guiding resource allocation, enhancing governance, and addressing social and ecological inequalities. The findings of this study provide a critical foundation for reimagining urban and regional planning in Turkey and beyond, contributing to global efforts toward eco-social integrity in a post-growth context.

The Circular Economy of Cities and Regions: Towards a Critical Spatial Perspective

Authors: Marcin Dąbrowski¹; Karel van den Berghe¹

¹ Delft University of Technology

Corresponding Authors: k.b.j.vandenbergh@tudelft.nl, m.m.dabrowski@tudelft.nl

The circular economy (CE) has emerged as a sustainability prominent framework, garnering attention from scholars and policymakers and influencing the policies of cities and regions. However, urban and regional CE strategies tend to focus predominantly on ‘looping actions’ (see Williams, 2021), such as using waste as a resource and reducing resource consumption. This approach often neglects the socio-spatial preconditions and implications of ‘going circular.’ Growing criticism of the urban CE agenda highlights these shortcomings (Dąbrowski et al., 2024), noting that circular actions and strategies are not always sustainable (Taelman et al., 2020), can perpetuate the growth-based paradigm and spatial inequalities (Savini, 2024), and fail to fully exploit circularity’s potential to drive socially inclusive (Vanhuysse et al., 2022) and regenerative (Williams, 2023) transformations of cities and their hinterlands. This paper adds to these debates by shedding light on the interplay between spatial planning and CE strategies, emphasising how the spatial context influences—and is influenced by—CE interventions.

Drawing inspiration from Meerow and Newell’s (2016) critical analysis of urban resilience—another increasingly contested urban policy ‘buzzword’—we propose a critical perspective on the urban and regional circular economy. Specifically, we question: for whom, how, where, and why should cities and regions develop circular economy strategies? Posing these questions prompts a more critical approach to the ‘footloose’ concept of circular economy, especially when it is implicitly applied to spaces like cities or regions, which are far from being neutral backdrops for the implementation of such policies.

Studying a range of real-world examples of urban and regional circular policies and projects implemented in North-West European cities, we explore these questions and demonstrate how CE strategies are deeply embedded in spatial contexts and territorial governance arrangements, reflecting broader (often dominant) political and economic agendas. Our findings reveal the dual role of cities and regions as both starting points and contested arenas for implementing CE strategies. Successes and limitations of existing CE approaches are examined, highlighting how spatial planning practices can either mitigate or exacerbate the uneven distribution of the externalities of circular activities in urban regions.

By this, we contribute to the increasingly lively and politicised scholarly debates on the role of CE in spatial development, while calling for planners to adopt a politically aware, context-sensitive approach to designing and implementing circular economy policies.

Twisting the loop: 'Patchworking' local value regimes toward a circular economy

Author: Iulian Barba Lata¹

¹ *Radboud University Nijmegen*

Corresponding Author: iulian.barbalata@ru.nl

Over the past years, the concept of circularity has gained considerable momentum in spatial planning as part of the broader transition predicated upon resource efficiency, climate change mitigation and the promise of an economic makeover. With cities and regions envisaged as frontrunners of the circular transition, the turn to spatial planning came as a natural step in problematizing the role of local value retention and upscaling toward a circular economy. Both issues beg the question of what value regimes are desirable within emergent circular ecosystems, and whether those provide more spatially and environmentally just alternatives to the status quo. In this exploratory paper, I adopt a topological standpoint to reflect on the limitations and potentialities of circular-regenerative systems to propose an alternative view of upscaling as a patchworking process, whereby circular value regimes play a foundational role.

Designing Degrowth Within: Keeping or Leaving River Burials, Which Costs More?

Authors: Ceren Gamze Yaşar¹; Zeynep Eraydın¹

¹ *TED University*

Corresponding Authors: zeynep.eraydin@tedu.edu.tr, ceren.yasar@tedu.edu.tr

Designing and planning the retreat of urban areas where needed is an alien concept for the urban planning and design realm. Spatialization of degrowth within post-growth urbanism context is also a relatively new pursuit. The built environment of cities once produced as solutions to specific problems within a specific climate is now facing problems as the results of previous eras' solutions and the unpredictability and uncertainty brought by the new realities of the climate crisis. Within this climate, nature and the city nexus, to explore the spatial possibilities of degrowth in the existing urban fabric and to compare the costs of keeping the problematic urban spatial solutions as they are versus adapting with nature based urban spatial solutions, the buried rivers of Ankara have been selected as the vessel.

For this study, aiming to examine the costs and benefits of the built environment of the urban fabric alienated from nature and the prices we pay for keeping the urban fabric

as it is, Ankara—a city where rivers were buried and transformed into developed urban land as a solution to development problems throughout its history, is a unique research context. Today, Ankara faces serious challenges due to the invisible water flow through and within the urban fabric including both infrastructures and superstructures, and the unpredictable behavior of these buried rivers, exacerbated by the climate crisis.

The tension between nature and the city, in the form of the buried urban rivers, is usually handled with two distinct and even opposing views regarding the juxtaposition of natural water systems and urban areas. The first one prioritizes the ecosystem and focuses on peripheral or open rivers while the second one adopts a purely urban approach, focusing on the role of natural areas within urban design and planning, viewing them as public elements with a function within the urban system. The only way to move forward in a healthy integration of the natural areas in the urban space is to reconcile these two within the context of the degrowth spatialization efforts.

Within the scope of this study, with a historical-geomorphological perspective, Ankara's urban fabric and its relationship with water are analyzed. Furthermore, the ongoing problems caused by the burial of rivers are spatially analyzed in order to discuss the spatial possibilities of degrowth and new planning and urban design policies for the medium and the long-term. The findings of this study ultimately reveal that the cost of maintaining urban space as it far exceeds the benefits of prioritizing nature and making rivers visible again through a new, nature based degrowth approach.

Beyond climate change. Retreat susceptibility of the Italian urbanised coastlines

Authors: Francesco Curci¹; Giacomo Ricchiuto¹

¹ *Department of Architecture and Urban Studies, Politecnico di Milano*

Corresponding Authors: francesco.curci@polimi.it, giacomo.ricchiuto@polimi.it

This research aims to examine the potential role of planned retreat strategies in the socio-ecological transition of Italian coastal areas, in light of the challenges posed by the contemporary post-growth context.

In Italy, the phase of intense economic growth that characterised the second half of the twentieth century coincided with widespread urbanisation, often occurring in the absence of adequate planning or through the use of inadequate regulatory frameworks. Initially concentrated around major urban centres, this urban expansion progressively spread across lowland areas, radically transforming agricultural and coastal landscapes. Today, the urgency of adopting measures to mitigate global warming, as well as the need to fundamentally rethink not only how but also where we inhabit the planet, is beyond dispute.

In response to the current climatic, demographic, and economic dynamics affecting Italy and most European countries, urban planning is called upon not only to develop widespread strategies of ecological regeneration and reconversion within highly dense and intensely urbanised contexts, often affected by processes of decommissioning and abandonment, but also to critically question the very existence of vast portions of contemporary urbanisation, which are experiencing premature obsolescence for multiple reasons, not always or exclusively linked to the impacts of climate change. From this perspective, it is crucial to explore the role and potential of planned retreat strategies: urban planning approaches capable of decisively addressing the growing uncertainties and vulnerabilities that characterise large portions of contemporary territory, including

in the Italian peninsula and across Europe. Investigating such processes entails challenging the prevailing paradigms - both reassuring and illusory - of unlimited growth and risk management, fostering a conceptual shift from the logic of resilience to that of antifragility.

Following an outline of the theoretical-conceptual framework, this paper presents a methodology for identifying the conditions and characteristics that render certain Italian coastal urbanisations particularly susceptible to planned retreat interventions, accompanied by an initial national-scale mapping. The findings highlight that, unlike in other parts of the world, planned retreat in Italy is not solely a strategy to address climate change, but also a means of enhancing safety and accessibility to the coastline, reclaiming public spaces and assets, and preserving coastal landscapes and ecological systems.

In the concluding section, the paper underscores the need to integrate such approaches into existing urban planning instruments, as well as to rethink the education of urban planners and technical professionals within universities. This would promote a culture of demolition that takes into account the socio-economic implications of retreat, the reuse of waste materials produced in the process, and the regeneration of vacated spaces in all their ecological, social, and spatial dimensions.

Creative Hubs in Transition: NGBG and the Role of Creative Hubs in Post-Growth Urban Transformation

Author: Burak Sayin^{None}

Corresponding Author: burak.sayin@ses.lu.se

This paper examines the transformation of the NGBG community space in Malmö, Sweden. Originally established as a grassroots music festival eight years ago, it is now a key cultural hub fostering creativity and civic engagement. In the rapidly gentrifying SofieLund neighbourhood, NGBG faces mounting pressures as the city enforces a sound-free zone and implements a master urban plan for 2040, prioritising commercial development. These changes highlight the tensions between grassroots cultural spaces, gov-

ernance strategies, and urban development in the context of post-industrial, growth-driven urban transformations.

Through a mixed-methods approach—combining ethnographic fieldwork, semi-structured interviews with community members, policymakers, and private stakeholders, and document analysis of local policies—this research investigates the role of creativity in fostering eco-social resilience. It examines how NGBG adapts to urban growth imperatives while navigating the challenges of marketization and gentrification. Central questions include: How can cultural hubs like NGBG balance their creative and civic missions amid increasing urban commercialization? How do governance models influence the inclusivity, accessibility, and ecological sustainability of such spaces?

The paper situates NGBG in post-growth urbanism, where creative hubs are part of an “organisational field” (Scott, 2014) in reshaping urban metabolisms and integrating social equity with ecological balance. The paper explores how NGBG fosters regenerative practices that counter conventional growth-driven urban models. Rather than solely focusing on culture-led regeneration, this research examines how city growth frames the field of action and remakes institutions (the City (Park and Burgess, 1925)), often embedding them within frameworks of market-driven urban development. It further considers how such dynamics can be reimagined in a post-growth context to prioritize inclusive governance, equitable resource distribution, and collective civic urban action through creativity and community engagement.

This paper contributes to reimagining cities as sites of eco-social integrity, where creativity, culture, and community-based governance create alternative pathways to a post-growth urban future. It offers actionable insights into the intersection of cultural spaces and policy, demonstrating how creative hubs can anchor sustainable and inclusive urban transformations.

Conscious shrinkage

Author: Marco Mareggi¹

¹ *Politecnico di Milano Dipartimento di Architettura e studi urbani*

Corresponding Author: marco.mareggi@polimi.it

The paper aims to address the issue of post-growth urbanism in low-density and marginalised contexts, where both the urban and the economy have not grown for a long time but where public administrations and citizens are unable to think of different interventions beyond growth.

The paper opens with a consideration of the definition of the study context, distinguishing between less favoured areas –contexts in which the implementation of structural measures of the Common Agricultural Policy (CAP) aims at preventing land abandonment, preserving the farming population in these areas, and maintaining the cultural landscape (Dax, 2005) –and inner peripheries, which, in the recent debate (Espon EGTC, 2018), identify territorial areas characterised by three main aspects: low

economic potential, poor access to Services of General Interest (SGI), and a lack of relational proximity.

Afterwards, the text is structured into three parts.

The first section presents and discusses various approaches to revitalising abandoned or neglected hamlets that have emerged in literature and practice over the last two decades. In it, different development models (tourism, construction, manufacturing, and residential) (Andreassi, 2016) are recognised on one hand. They are defined as such because they aspire to be forms of territorial development, albeit sometimes so sectoral that they do not constitute an effective generator of durable and sustainable economies and societies. On the other hand, some strategies for reactivation (hospitality, production, culture, reconnoitring, conservation, and cooperation) of abandoned villages are presented (Berizzi, Rocchelli, 2019), which bring together successful experiences and refer to a variety of modes of intervention. Tourism is not the only perspective for economic revitalisation (Bonfantini, 2016), just as the preservation of both tangible and intangible cultural heritage is at the centre of interventions. However, it is not always a guarantee for revitalisation and development, nor for the production of new economic and social values (Oteri, 2020).

This review of development models and strategies highlights the many attempts to reactivate abandoned hamlets and invites questions about the absence of a shared, selective planning approach for areas of intervention. In particular, urban planning seems to be latent in its land design and governance agenda concerning the recovery or loss of human activities in villages.

The second section is thus devoted to reflecting on a possible alternative to recovery and reactivation, shifting toward forms of managed abandonment and shrinkage. Indeed, urban planning has rarely addressed situations where abandonment is already underway, and often entire settlements have fallen out of social and economic cycles (Rink et al., 2012; Zanfi, Curci, 2020; Mareggi, 2021). Even within conservation disciplines, where there is greater awareness and a substantial tradition of debate, there does not seem to be a widespread recognition of the “inevitable loss” of places where depopulation, underuse, and economic and social decline are irreversible. However, it is clear that it is impossible to re-inhabit all marginal areas (Kealy, 2020) and “only a (guided) abandonment is conceivable” (Oteri, 2020: 50).

The third section aims to reflect on a proposal for conscious shrinkage elaborated for the Grecanic territory of the metropolitan city of Reggio Calabria as a possible broad-area strategy to be presented to local authorities and citizens.

The research is based on an extensive review of Italian and international literature carried out as part of fundamental research (Riba, Lost and Found 2020, Department of Architecture and Urban Studies, Politecnico di Milano) and an action-research activity conducted within the framework of the definition of the Metropolitan Strategic Plan of the metropolitan city of Reggio Calabria.

Collaboration Beyond Growth? Possibilities for Innovative Adaptive Governance in Metro-Boston

Author: Antonio Raciti¹

¹ *Department of Urban Planning and Community Development*

Corresponding Author: antonio.raciti@umb.edu

In the face of climate change, planning scholars and practitioners have challenged “conventional growth-driven development models”(track 1: post-growth urbanism) and opened the search for adaptation planning practices that could foreground planning futures beyond growth. In this attempt, stakeholder collaboration across public, private, non-profit, and philanthropic sectors has become critical for any innovative adaptation planning initiative. Such assumption has brought scholars to reflect on the meaning of innovative governance institutions capable of generating innovative governance infrastructures to address problems through coordinated efforts (Vella et al., 2016) In the search for solutions beyond growth, such coordinated efforts have been seen as the panacea for “good planning” in the face of the crisis.

In this paper, I am interested in questioning this assumption by examining how climate adaptation stakeholders in Metro Boston collaborate to advance an adaptation agenda that could innovate adaptation planning toward development models beyond growth. Metro Boston has been the breeding ground for adaptation initiatives that, while highly collaborative in nature, never deeply questioned an overall agenda still focused on physical development and economic growth. Adaptation projects are often either not implemented or fail to be adaptive when adaptation agendas take priority (Markus & Savini, 2016), the fiscalization of land use has contributed to non-adaptive coastal development, despite extensive research warning about the severe impacts of rising sea levels (Shi & Varuzzo, 2020), and, finally, the risks most concerning to socially vulnerable individuals, particularly along racial lines, are frequently overlooked in mainstream resilience strategies (Martin, 2015).

The paper discusses how governance infrastructures shape themselves around power clusters, which prevent collaborating actors from achieving innovative planning agendas and coalitions and keep advancing initiatives driven by a growth rationale. Breaching power clusters’ long-term coalitions is key in determining diverse and more effective collaborative conditions among urban actors and, hence, advancing new models of urban development beyond growth.

Land Consumption vs. Population Decline: Evaluating Poland's Spatial Planning Strategies in Medium-Sized Cities

Author: Agnieszka Cieśla¹

¹ *Warsaw University of Technology*

Corresponding Author: agnieszka.ciesla@pw.edu.pl

According to data from the European Environment Agency (EEA 2023), Poland is among the leading countries in the rapid transformation of undeveloped areas into residential development. Between 2012 and 2018, it ranked second in Europe in terms of the amount of agricultural, forest, and pastureland converted for housing purposes. These figures significantly exceeded those recorded in Western European countries. The issue of surplus land designated for residential development has also been extensively discussed in numerous national scientific studies.

In an effort to address this issue, several attempts have been made over the past two decades to reform the planning system. The successful reform was first implemented in September 2023, and Poland is now undergoing a comprehensive transformation of its spatial planning system aimed at limiting the expansion of new residential areas. This reform was driven by the European Union's mandate to curb urban sprawl and constitutes one of the key milestones of the National Recovery Plan (KPO). The primary objective of the reform is for each of Poland's 2,477 municipalities to adopt a completely new, legally binding land use plan that will cover their entire area. Strict regulations have been introduced to determine the required area designated for housing purposes. The deadline for completing these land use plans is set for December 31, 2025, leaving municipalities with a very short timeframe for compliance.

In my presentation, I will focus on 16 medium-sized cities, each located in a different voivodeship (region). These cities were selected based on a recently published report on the functional hierarchy of Polish cities and are categorized as "supralocal center strong." Medium-sized cities form the backbone of Poland's advantageous polycentric urban structure, which should be preserved. However, many of these cities are currently experiencing socio-economic crises and significant population declines. Simultaneously, the development of new residential areas is increasing, primarily driven by extensive single-family housing, often arranged in a chaotic manner. This phenomenon has led to a situation where increasingly large areas of land are being occupied by a constantly diminishing population. Polish cities are not unique in this regard. Similar patterns can be observed in many shrinking cities across Europe and worldwide. In my presentation, I will illustrate the dynamics of population decline and the increase in land consumption in the 16 selected case studies. Analyzing the scale and pace of land development for residential purposes in relation to demographic trends will help identify the medium-sized cities that are facing the most severe challenges in terms of rational spatial development. This analysis will also highlight regional variations, illustrating the differences in the scale and pace of new land development across the 16 voivodeships. It will identify regions experiencing particularly rapid suburbanization as well as those where the process is slower or better regulated through spatial policies. Although Poland operates under a strong centralist model, regional variations in planning practices and land consumption can be observed.

In the second part of my presentation, I will present calculations of possible land consumption based on the new regulations for selected case studies. This analysis aims to demonstrate that the current method is not universally applicable and, in some cases, may contribute to even more intensified urban sprawl.

T_01 POSTGROWTH URBANISM / 1671**Wellbeing and New Urban Regeneration Agendas in China: Insights from Shanghai**

Author: Sabina Cioboata¹

¹ *University of Westminster*

Corresponding Author: s.cioboata5@westminster.ac.uk

Following four decades of reform, China has lifted millions out of poverty. However, the social costs of the country's growth-oriented agenda have long been scrutinised, with phenomena such as rapid urbanisation being one of the most transformative forces in this process. Under the umbrella of urban regeneration and quality of life improvements, state-led projects have been criticised for their neoliberal focus on capital accumulation through urban redevelopment, often characterised by selective physical upgrading, large-scale demolitions, forced relocations, and the socio-spatial marginalisation of vulnerable communities (He & Wu 2007). In response, recent policy and paradigm shifts such as the 2014-2020 *National New-Type Urbanisation Plan* started pointing towards an increased governmental interest in addressing some of the shortcomings of the past and promoting new visions for sustainable urbanisation rooted in the need to develop "people-oriented, ecologically livable, fair and just, inclusive and harmonious environments" (State Council 2014). Yet, complex structural mechanisms and institutional barriers in the Chinese context may mean that despite recent efforts to integrate practices focused on community wellbeing and quality of life, shortcomings remain. Such considerations call for a more nuanced reflection on issues of wellbeing, urban development, and urban regeneration in China.

Against this backdrop, this research examines whether shifting policy, paradigm and practitioner understandings of community wellbeing are being materialised into new urban regeneration solutions in Chinese cities. More specifically, the study focuses on the context of Shanghai, one of cities spearheading urban policy and practice experimentation and innovation efforts in China (Zhang, LeGates & Zhao 2016). In its latest Master Plan, Shanghai articulated, amongst other ambitions, a call for advancing public participation and "organic regeneration", described as the incremental revitalisation of older residential areas with the purpose of improving living conditions and facilities (Shanghai Urban Planning and Land Administration Bureau 2018).

Drawing from policy reviews, interviews with key urban regeneration practitioners, and field observations of ongoing regeneration projects conducted in Shanghai in the period 2018-2020, the study aims to:

- a) Reveal urban practitioners' understanding of wellbeing, based on their operating within a specific disciplinary background, system of values, agendas and institutional positions;
- b) Critically examine how wellbeing in urban regeneration is planned for and negotiated at local level, and how this is materialised into practice;
- c) Understand what processes and outcomes of current urban regeneration projects in Shanghai reveal about the state of innovation in urban projects, at present.

The study reveals that *weigengxin*, or ‘micro-scale urban regeneration’, has become a key approach for transforming inner-city, dilapidated neighbourhoods in Shanghai, a strategy focusing on affordable, place-specific interventions that prioritise in-situ upgrade, forms of public participation, and community building. Examples include incremental housing upgrades and the improvement and/or creation of public spaces and facilities such as community gardens and elder care centers, as well as incremental housing upgrades –interventions aimed at addressing some of the needs of vulnerable groups such as elderly and low-income populations. In that sense, the research highlights an understanding of wellbeing in urban regeneration extending beyond physical improvements to include, instead, investments in people, with projects often integrating education agendas on health and environmental sustainability, as well as efforts to promote new forms of grassroots governance amongst residents.

The study also reflects on the pivotal role of community planners during planning, design and implementation phases, a relatively new professional role in China represented by practitioners affiliated with academia. Serving as mediators between district and local governments, and communities, community planners’ unique position places them at the crossroads between efforts to maintain existing power dynamics and business-as-usual practices, while also experimenting with new regeneration solutions and governance mechanisms.

Imagining the Post-. Can Multispecies Urbanism be a Track for Radical Change? The case of Brussels

Author: Anastasia Battani¹

¹ *Iuav University of Venice, Doctoral School of Project Cultures, Urbanism*

Corresponding Author: abattani@iuav.it

As we globally experience a daily hyper-acceleration of multiple crises and with 2024 being the first recorded year of the Earth’s average temperature crossing the 1,5 °C boundary set by the Paris Agreement, the inadequacy of such global strategies has been unequivocally recognized. In the face of this stagnant situation, the change of the capitalist system is increasingly recognized as the condition sine qua non for starting to think seriously about a way out of the socioecological catastrophe, as even an equitable degrowth is incompatible with capitalism (Kohei, 2024). Scholars are foregrounding a variety of alternative paths for a post-capitalistic and post-growth world, supporting a pluriversal range of possibilities rooted in the local cultures and economies, arriving mostly –but not only –from Indigenous or marginal communities of the Global South

(Demaria and Kothari, 2017).

In this framework, Multispecies thinking has emerged in the West as a refusal of the Euro-Atlantic thought and an alternative for making worlds and kin in our era (Haraway, 2015). Nurtured by a strong core of critical theory in the environmental humanities, particularly critical eco-feminism, with the guidance of Indigenous philosophies and a decolonial approach, Multispecies is asking us to radically reconsider our relation with other living beings and matters, putting their needs at the front alongside ours. Being substantially different from other ecological discourses and the traditional planning approach that relies on conservation and protection, the focus is not on “leaving alone” the environment and other living beings to be able to thrive, but rather on multispecies entanglements and on learning how to live together (Houston et al., 2018). Moreover, recognizing the interconnectedness between oppressions under the system of the capital, the aim is to look after an idea of justice encompassing diverse human and more-than-human subjectivities (Winter, 2022), able to reunite different struggling in a common fight for emancipation.

My research tries to understand the implications of such an approach in Urbanism. What does it mean to fight for the emancipation of the living in spatial terms? Which are the main spaces of friction in the western city? Which technical practices can we mobilize? What tools do we have to change, and what pre-conception and attitudes of the discipline do we have to abandon? Where are the main obstacles in the European planning system to adopting such an approach?

To start addressing these questions I discuss the case study of the city of Brussels, where a long tradition in urban ecology, re-cycle/up-cycle, and metabolism (Grulois, Tosi and Crosas Armengol, 2018) is today accompanied by a flourishing of tentative multispecies urban practices, that involve active citizens, administrations, university students, researchers, and professional practitioners. Through fieldwork and interviews, I map the emergence of these novel practices as well as their potential and struggles in being realized. I underline the scope, the tools, the objectives, and the imaginaries that drive these projects. Finally, I critically question whether these strategies could imagine and steer a radical change for a post-growth urban era, as the ambition the theory set.

Alto Medio Sannio inner area between marginality, latent place knowledge and territorial heritage

Authors: Francesca Giangrande¹; Luciano De Bonis¹; Giovanni Ottaviano¹

¹ University of Molise

Corresponding Authors: giovanni.ottaviano@unimol.it, luciano.debonis@unimol.it, francesca.giangrande@unimol.it

This contribution raises a reflection on the planning of the so-called inner areas, in which depopulation, emigration, social and productive rarefaction, abandonment of the land, are distinctive phenomena. Shaping a new role for inner areas requires forms of community and the arising of new subjectivities that rely on forms of direct democracy (Magnaghi, 2020), reconstructing the places of living and promoting the synergic connection between local economies (Bruni, Zamagni, 2015). The authors analyze the first results of the ongoing PRIN (Research Project of Significant National Interest) project “RE-PLACE. REframing PLace-based Approach through the Cultural Ecosystem services of inner areas”. It aims to strengthen the role of local communities in building “place knowledge” and territorial heritage also through the innovative lens of Cultural Ecosystem Services (CES), which represent non-material and/or socio-ecological benefits that people gain from ecosystems through spiritual enrichment, cognitive development, reflection, recreation, aesthetic experiences, and cultural and educational values (Chan et al., 2012; Andersson et al., 2015). The project investigates three Italian inner areas (Alta Marmilla and Gennargentu - Mandrolisai in Sardinia, Alto Medio Sannio in Molise, Madonie in Sicily,) and promotes a multi-scalar approach, based on co-evolutionary approaches between human settlement and the environment, and oriented to understand and maximize the resilience of marginalized territories, to build alliances and collaborative processes and to promote place-making developed by communities.

This approach implies the need to support the (re)discovery of ancient and new forms of local knowledge which allow the continuous adaptation to the mutability of environmental contexts and whose loss undermines the effectiveness of interventions implemented in more recent times. It also encourages the establishment of new relations between human societies and non-human environmental elements that allow the continuous generation of innovative local knowledge (De Bonis, Ottaviano, 2023).

The impact between the growth of “place awareness” of local communities and the identity characteristics of the heritage make possible to produce “territorial added value” (Magnaghi, Dematteis 2018) based on visions, strategies and tools and on new forms of self-government of territorial commons, namely place-specific values and resources, sedimented over time. In detail, the contribution focuses on the case study of Alto Medio Sannio inner area, made up of 33 small (of which many have less than 1,000 inhabitants) municipalities between the provinces of Isernia and Campobasso, on the border with Abruzzo region. The research path is designed to support the expression of the autonomous local development practices based on the continuous reproduction of territorial heritage. It is intended to capture the critical issues of some ongoing experiences in the area which are aimed at reducing the fragility of marginalized contexts, also identifying the ineffectiveness of the tools that until today have perpetuated the gap and the poor integration of these contexts.

Particular attention will be dedicated to a very popular and current topic in these areas: the planning of “tratturi system”(territorial system of sheep tracks), ancient transhumance routes which today are considered important elements of the territorial heritage to be valorised. These elements, from a multifunctional perspective, are considered by the authors to be latent resources for sustainable development that takes into account the benefits that ecosystems provide to the inhabitants of the area.

RURAL TRANSFORMATION AS A RESULT OF COUNTER-URBANIZATION DURING AND AFTER THE COVID-19 PANDEMIC PROCESS IN ZMR-SEFERH SAR

Author: Özge Ekinci¹

¹ Research Assistant

Corresponding Author: ozgesarikaya.91@gmail.com

The COVID-19 pandemic has significantly reshaped urban and rural dynamics, challenging the conventional urban growth paradigm and accelerating counter-urbanization. This shift has profound implications for postgrowth urbanism, which advocates for an alternative to growth-driven urban development, emphasizing ecological balance, sustainability, and social equity. Counter-urbanization, initially conceptualized by Berry (1976), refers to the demographic movement from urban to rural areas, often driven by environmental concerns, affordability, and changing work conditions (Walmsley et al., 1998). The pandemic-induced transformation, particularly in Mediterranean cities such as İzmir, Turkey, has led to a reconfiguration of spatial and socio-economic structures in rural areas, requiring a critical examination of its long-term consequences (Vinci et al., 2022).

This study investigates the rural transformation in Seferihisar, a peripheral district of İzmir that experienced one of the highest population growth rates in the post-pandemic period (TURKSTAT, 2023). The research employs a mixed-method approach, combining quantitative demographic and economic data with qualitative insights from planning policies and community responses. The findings highlight three major transformations:

Spatial Transformation: Increased housing demand, rising land prices, and changing land use have led to rural gentrification, whereby wealthier urbanites displace traditional rural populations (Stockdale, 2010). This process alters the built environment, impacting agricultural land use and accelerating commodification. The redistribution of population also intensifies urban sprawl, leading to a hybrid rural-urban landscape that disrupts existing ecological systems (Nelson et al., 2010).

Socio-Economic Transformation: The influx of higher-income populations has contributed to the restructuring of rural economies. The shift from agriculture-based livelihoods to service-oriented economic activities fosters disparities between long-term rural residents and new arrivals. Rural gentrification in Seferihisar manifests through a change in occupational structures, increasing the cost of living and social tensions between different socio-economic groups (Rojo-Mendoza et al., 2022).

Governance and Sustainability Challenges: Counter-urbanization presents governance challenges, as rural municipalities struggle to provide adequate infrastructure and services to an expanding population. Policy gaps in rural planning contribute to unregulated construction, inefficient land use, and environmental degradation. The lack of a strategic framework for sustainable rural development threatens the long-term viability of counter-urbanization as a resilient postgrowth model (Rezvani, 2007).

The findings of this study suggest that counter-urbanization in Seferihisar reflects broader tensions in postgrowth urbanism, revealing the need for innovative rural planning strategies. Current rural transformations are largely market-driven, favoring economic growth at the expense of environmental and social equity. Alternative models, such as cooperative housing, participatory land-use planning, and circular rural economies, could mitigate the negative consequences of counter-urbanization while fostering sustainable rural futures.

This research contributes to the growing discourse on post-pandemic urban-rural transitions, providing insights into the governance, economic, and ecological dimensions of counter-urbanization. By integrating principles of postgrowth urbanism, policymakers and planners can adopt context-sensitive strategies that balance economic opportunity with environmental stewardship and social inclusion. Addressing the challenges of counter-urbanization requires a decentralized, community-driven planning approach that prioritizes adaptive resilience, resource-efficient land management, and inclusive rural policies. The lessons from Seferihisar can inform broader debates on rethinking urbanization and reimagining sustainable rural development in a post-pandemic world.

Perceptual Encounters with the Urbanization of Nature

Author: Güzin Yeliz Kahya¹

¹ *Erciyes University*

Corresponding Author: yelizkahya@gmail.com

At a time when the ecological destructiveness of urbanization and its contribution to environmental problems is widely recognized in mainstream discourse, Urban Political Ecology (UPE) offers a crucial critique of urban design and planning. UPE challenges these practices to align with agendas prioritizing social equity. Even ecological urbanists, despite focusing on sustainability, face critiques highlighting how ecological metaphors in urban design can perpetuate discriminatory urban development processes (Tzaninis et al., 2023; Gandy, 2015; Kaika, 2014). On the other side, critical spatial practices—often employing artistic metaphors, analogies, and narratives—offer tools to generate critical perspectives on the socio-ecological impacts of capitalist urbanization. These practices contribute to alternative urban imaginaries by engaging with cognitive, emotional, embodied, and aesthetic forms of knowledge and affect. UPE scholarship increasingly embraces these approaches, drawing insights from race, gender, and sexuality studies, as well as postcolonial, indigenous, feminist, and queer theories (Heynen, 2018; Loftus, 2019).

This presentation takes a collaboratively driven video-narrative project, *Symbiosis*, undertaken by me with two colleagues from diverse disciplinary backgrounds as a case to discuss the value of situated everyday knowledge with the understanding of contemporary patterns of urbanity. The project explores and documents Kayseri's urban landscape through nomadic fieldwork around its volcanic, mountain-shaped terrain. While the project narrates our encounters and perceptual experiences with the mountainous landscape, this presentation examines the learnings and outcomes of the project through a UPE framework. This approach enables us to ask for an understanding of the city's urbanization that moves beyond human-centric imaginaries, incorporating regional dynamics essential to deciphering urban patterns.

Through this lens, the presentation connects sensory and experiential knowledge to questions of metabolic relations between urban settlements and uneven flows of capital, as well as more-than-human ecological processes. By decomposing its perceptual art-based explorations through the lens of a new vocabulary of planetary urbanization, the project addresses the interplay between urban economic and political dimensions—such as unsustainable real estate development and the practices of profit-driven energy companies—and the dynamic yet increasingly vulnerable terrestrial environment of Erciyes, Kayseri's iconic volcanic mountain.

By employing perceptual and art-based explorations, the project as a case exemplify-

ing how sensory engagement with the urban landscape can deepen our understanding of urbanization's socio-ecological implications and this presentation invites urbanists to interpret and value novel metaphors, analogies, and narratives emerging from critical spatial practices, exploring their potential to meaningfully inform urban planning and design practices.

Post growth and Being. What is envisaged for human being in a post-growth world.

Author: Sophie Sturup¹

¹ *Xi'an Jiaotong-Liverpool University*

Corresponding Author: sophie.sturup@xjtlu.edu.cn

This paper asks what is envisaged for being in a post growth world. It stems from the observation that in calling for a transformation of human relations in almost every sphere of action, post growth and degrowth, are in some way talking about a transformation of human being. For example, according to Savini (2024, p. 4) 'Degrowth envisions a shift in the social norms that sustain the compulsion to grow, accumulate, exploit and prioritise productivity'. I have argued elsewhere (Low & Sturup, 2018; Sturup & Low, 2017) that being is both constituted by, and constituting of, social norms. Therefore, a titanic shift of the nature called for by Savini, is going to have ontological implications. Undertaking a substantial review of the post-growth and degrowth literature, combined with a personal journey through a process of degrowing, this paper considers the ontological implications of degrowth. In so doing the paper attempts to expose those ways of being most likely to be confronted during a transformation to this new world. A world which many ache for, but at the same times forces us to confront central constructions of who we are, how we validate ourselves, and what we therefore might do.

Emerging conflicts between infrastructure-based development strategies and post-growth tendencies. The case of transport acceleration projects in the Salento region, Italy

Author: Gloria Toma¹

¹ *Polytechnic University of Bari*

Corresponding Author: gloria.toma@uniba.it

The present research investigates the relationship between transport acceleration projects and growth-based development strategies and subsequently compares these with the emergence of opposing trends in the possibility of post-growth urbanism.

The rhetoric surrounding the effects of infrastructure on territorial development has long been a subject of debate among scholars (Plassard, 1990; Barré, 1997;). Despite scholars repeatedly clarifying that there is no direct correlation between infrastructure and its structuring effects (Plassard, 1990), political decisions have nevertheless defined strategic development projects through an infrastructure-based approach (Offner, 1993; Givoni, 2006).

Over time, infrastructure policies have shifted their focus from the introduction of new infrastructure to the reduction of distances and travel times. This transition can be understood as part of a broader phenomenon of transport acceleration, which is itself part of a larger current that also encompasses a social dimension (Rosa, 2015). It gave rise to an imaginary in which the ever-increasing speed is associated with an idea of progress (Tomlinson, 2007). Acceleration of transport led to a hierarchisation and polarisation of space (Battiau, 1998; Mazzeo, 2012). This resulted in a 'dualised' territory (Ollivro, 2000), where the primary economic activities are concentrated near the poles and points of access to the network (Monzón et al, 2013).

In Italy, the development of a 'dualised' territory has resulted in the affirmation of marginalised areas. These areas have been the focus of some strategies aimed at reducing the gaps with the central poles, which have also involved infrastructure projects (UVAL, 2014). The overarching objective of these initiatives was to stimulate economic development by facilitating faster connections with primary metropolitan hubs. In order to ascertain the efficacy of these projects, it is essential to consider existing research that has identified a common thread in the affirmation of non-mechanical cause and effect relationships, emphasising the need to consider the context, pre-existing dynamics and in-place strategies (Offner, 1994; Barré, 1997).

The primary objective of the research is to investigate the consequences of accelerating infrastructure projects, analysing the relationship with other levels of planning and growth-based strategies. In addition, the possibility for post-growth territorial development are investigated.

The case study that has been identified pertains to the southern Salento area. In this context, the phenomenon of transport acceleration was expressed through projects aimed at extending the road section of existing infrastructures. The topography of South Salento is characterised by a considerable distance from the primary hubs of service provision. In this area, an extension of an existing road, which runs north-south through the territory, has been planned. Over time, the infrastructure area has experienced contrasting trends. On the one hand, there has been a development of commercial and productive activities, with the road regarded as a strategic axis for the development of the territory. Conversely, there has been a propensity to preserve and enhance the distinctive characteristics of the landscape through the development of slow mobility practices, a different imaginary based on slowness and de-growth. This

necessitates an investigation into the potential scenarios that might emerge in the wake of the road transformation project.

In the first the research analyses the relationship between the project, pre-existing trends, and the strategies. This component aimed to predict the effects at an urban planning level. A second part of the study involved the confrontation of alternative trends with the definition of the margins within which a de-growth spatial development could take place.

The results of the study indicated concrete possibilities for the development of an alternative territorial vision; however, the study concluded that a major role is played by local actors.

ADDRESSING SOCIO-ENVIRONMENTAL PROBLEMS BY INTEGRATING BIODIVERSITY IMPACT CHAIN ANALYSIS INTO PLANNING: THE CASE OF MOUNT IDA, TURKEY

Author: Yağmur Özcan Cive¹

Co-author: Adile Arslan Avar¹

¹ *İzmir Institute of Technology*

This paper proposes an environmental conservation perspective to address multi-dimensional socio-environmental problems across various spatial scales by incorporating "Biodiversity Impact Chain Analysis (BIC)" (Büscher et al., 2022) into planning. The "Biodiversity Impact Chain" (BIC) analysis offers a methodological framework that aims

to unveil the biodiversity losses and socio-ecological inequalities that stem from isolated conservation practices, and to foster the connection between nature and urban areas. This analysis identifies activities that either enhance or degrade biodiversity across diverse regions and scales. Meanwhile, the studies of metabolic urbanisation and urban political ecology endeavour to examine “urban-nature” networks by assessing waste, infrastructure, construction inputs, mineral resources, and food supply, which are important inputs for BIC analysis considering city-region relations.

Recent nature conservation approaches are prone to ignore socio-environmental injustices and inequalities. For example, adaptation of “the ecosystem services” emphasising the valuation of the functions of critical ecosystems, including urban forests, wetlands, and upstream forests, for urban areas seem to extend the scope of environmental conservation in planning. However, they are inadequate in addressing environmental degradation resulted from intensive and expanded expropriation of nature beyond urban boundaries or defined areas of ecosystem services. On the other hand, critical debates in urban political ecology on nature conservation find no room or remain mostly outside of the planning discipline. Also, the debates centring around de/post-growth alternatives notably emphasise policies at the urban scale and focus on disparate sectors such as water resources, forestry, and agriculture in isolation. The critique of prevailing conservation approaches necessitates the interrogation of scale and boundaries of protection. Addressing alternatives in a spatially equitable manner necessitates a radical, relational and multi-scalar approach to nature conservation in planning.

The surrounding areas of the Mount Ida National Park characterised by forests and water resources have been exposed to massive and intensive expropriations (“so-called primitive accumulation”) through water and land grabbing practices and the emergence of socio-environmental inequalities at various scales. The paper draws on a BIC analysis conducted around Mount Ida National Park, considering conservation scales to uncover inequalities and socio-metabolic networks, to propose and politicise post-growth alternatives. To this end, firstly, ‘conservation scales’ were defined, and the BIC analysis was conducted to examine how conservation and growth-oriented planning policies can create privileged spaces and exacerbate inequalities in Mount Ida and surroundings. The analysis uncovers socio-environmental problems, growth-oriented strategies and their impacts on biodiversity, as well as who benefits and who suffers from these strategies.

Rethinking Urban Sprawl in the Context of Shrinking Cities: A Critical Review of Shrinkage Sprawl and Its Spatial Implications

Author: Başak Aycan Özkan^{None}

Corresponding Author: basak.aycan@tedu.edu.tr

Urban sprawl has long been a debated phenomenon within the context of growing cities and regions. The indicators, causes, and consequences of urban sprawl, as well as the policies developed to address sprawl development, have predominantly been discussed

in the framework of growing urban areas (Couch et al., 2005). On the other hand, studies on the increasingly prominent topic of shrinking cities since the 2000s reveal that urban sprawl and urban shrinkage emerge as parallel phenomena. Research has shown that cities experiencing demographic and (mostly) economic decline do not spatially shrink; instead, they expand (Reis et al., 2016). While the juxtaposition of the terms shrinkage and sprawl may seem paradoxical, shrinking cities continue to consume land inefficiently. It is evident that the concept of shrinking cities will not mark the end of urban sprawl. Just as shrinking cities are projected to be the future of many regions worldwide, urban sprawl seems to remain a form of growth for many shrinking cities.

In the examination of the phenomenon of 'shrinkage sprawl' (Siedentop and Fina, 2010), it has been observed that studies on sprawl in growing cities and research on shrinkage after the 2000s have been integrated. Sprawl development in growing cities is measured using variegated indicators of physical forms and patterns of land use. Many studies emphasize that relying on a single indicator to identify sprawl areas is insufficient. On the other hand, case studies on shrinkage sprawl have predominantly focused on changes in density in identifying sprawl development, which causes limitations in exploring morphological characteristics.

Shrinking cities are identified through population loss and demographic changes, such as aging and declining birth rates. Spatial indicators are not used in the designation of shrinking cities. The literature review shows that spatial analyses related to shrinkage sprawl remain significantly narrow. Even though theoretical research highlights the uniqueness of spatial characteristics of shrinkage across varying spatial contexts and periods, this observation has not been adequately reflected in shrinkage sprawl studies. This limitation might stem from the fact that while changes in the physical form of sprawl areas are visible, shrinkage does not leave a visible footprint on land. The most prominent spatial characteristics of shrinkage, such as increasing vacancy rates and perforation, are not observable in space unless demolition is actively undertaken by authorities. So, in the identification of urban sprawl in shrinking cities, the spatial dimension of shrinkage sprawl needs to be examined more extensively.

It is essential to investigate whether shrinkage sprawl exhibits physical forms that are similar or different from those observed in growing sprawl. The concept of shrinkage sprawl should be studied across diverse geographies, local conditions, and scales. By doing so, a complex conceptualization of shrinkage sprawl can be developed—one that is both globally relevant and locally adaptable. Developing a model for shrinkage sprawl would contribute to identifying sprawl in shrinking cities.

The inefficient use of limited land in shrinking settlements necessitates developing planning policies. Policies developed for sprawl in growing cities cannot simply be transferred to shrinking cities. It is essential to reconsider the current planning paradigm and its instruments. This requires a reevaluation of the shrinkage sprawl concept, ensuring its spatial dimensions are accurately identified.

This study critically examines research on shrinkage sprawl while supporting the development of new approaches on this subject. Based on the findings from the literature review, this study answers the following questions: Through which concepts and theoretical frameworks are shrinking and sprawling cities discussed? What types of data and indicators are used to identify those cities? How are socio-economic and spatial policies developed to address the challenges faced by shrinking cities?

Planning the Great Acceleration: Contributions of planning theory, ideology, and implementation to planetary transformation and social-ecological decline

Author: Mark Groulx¹

Co-authors: Ben Bryce ; Keone Gourlay¹; Mikhaila Carr¹; Tara Clapp¹

¹ *University of Northern British Columbia*

Corresponding Authors: mark.groulx@unbc.ca, gourlay@unbc.ca, mcarr@unbc.ca, tara.clapp@unbc.ca, ben.bryce@unbc.ca

In the years and decades following WWII, global energy and resource consumption were unleashed on a hitherto unseen scale. The fields of earth system science, history, and planetary health continue to grapple with the causes and consequences of this ‘Great Acceleration’—a proposed entry point into the Anthropocene. For its part, the profession of planning is yet struggling to put into an appropriate context its distinct and historically contingent contributions to this transformative period of planetary socio-ecological change. As a result, the profession also continues to misunderstand its present role in the spread of climate catastrophes, the collapse of global biodiversity, and the sharpening of wealth and health inequities.

This paper takes its cue from recent trends in research that are ‘globalizing’ perspectives on the processes of suburbanization and the distinct suburbanisms these processes produce. We explore spatial and temporal scale as necessary, conjoint lenses for articulating key contributions of planning to the Great Acceleration. Moving beyond the prototypical model of the metropolitan North American city, we present a story that links the industrial structure of a burgeoning hinterland region to the reproduction of a northern suburbanism tailor built for Canada’s resource dependent communities during the Great Acceleration.

Taking Prince George, British Columbia, Canada as an illustrative case, we draw on archival sources and spatial analysis of historical subdivision data. These streams of analysis allow us to track and explicate how dominant planning theories were deployed between 1946 and 1981 to both rationalize and accommodate urban expansion within British Columbia’s northern capital.

Through the application of Garden City planning and the Neighbourhood Unit, Prince George took on a spatial and built form not unlike those seen in suburbanisms across North America. This included the use of these planning norms to expedite the preparation and sale of lands by the most economically efficient means available. As early as the 1950s the efficiency of the Neighbourhood Unit underpinned a massive expansion of suburban growth into previously undeveloped areas. In the 1970s, a Garden City inspired growth plan rationalized a municipal boundary expansion that all but ensured an unsustainable future for the city.

Unlike regions established earlier in Eastern Canada, the northern suburbanism pursued in Prince George served additional, distinct rhetorical purpose. As part of Canada’s ongoing settler colonial project, civic boosterism drew from planning theory the concepts of safety, orderliness, and domesticity to sell a suburban ideal that would help attract the labour needs of a booming forest economy. Well beyond the footprint of the city proper, suburbanization propagated widespread ecological destruction across a region larger than France by ensuring the labour needs of an expanding extractive industry were in rich supply.

By exploring municipal-state coalitions in the use of Crown Land Grants to finance the outward expansion of development, our work illustrates novel financial mechanisms underpinning processes of suburbanization. Beyond this, we illustrate how a northern suburbanism that was used to attract westward European settlement became an enduring contribution to the Great Acceleration. During this era, planning theory, planning practice, and planning practitioners were active champions of the unquestioned

pro-growth ideology the fueled the global expansion of energy and resource use. The social-ecological consequences of this pursuit are now apparent at all scales.

Urban Heritage Conservation: A Turn to Post-Growth Planning in China?

Author: Mengci Xiao¹

¹ *University College London*

Corresponding Author: mengci.xiao@gmail.com

This research responds to a planning exception for urban heritage sites in China, in which, differentiated from the mainstream pro-growth ideologies, socio-cultural sustainability has been declared as a priority over economic growth. This planning exception suggests the potential that urban heritage sites have in encouraging urban planners to embrace post-growth ideas in China, which have not been sufficiently researched yet. To address this research gap, I investigate the urban conservation planning practice in Gulangyu World Heritage Site via a framework—planning for urban heritage sites beyond growth. The research indicates that attributing community to forming heritage significance opens the opportunity to favour a development that emphasises the enhancement of community livelihoods and sustainability over the pursuit of economic growth. Such conservation planning involves economic restructuring and a sufficiency lifestyle supported by spatial transformation towards social interactions, which shows some alignment with post-growth thinking. However, little evidence has indicated the planning for Gulangyu is related to a planned reduction.

Toward Integrated Planning for Circular Development in Cities: Insights from Literature and Chinese Policy

Author: Xinyu Lin¹

Co-authors: Lei Qu¹; Marcin Dąbrowski¹; Roberto Rocco¹

¹ *Department of Urbanism, Faculty of Architecture and the Built Environment, Delft University of Technology*

Corresponding Authors: x.lin-7@tudelft.nl, m.m.dabrowski@tudelft.nl, l.qu@tudelft.nl, r.c.rocco@tudelft.nl

The circular economy is increasingly regarded as a crucial strategy for mitigating resource scarcity and improving waste management in cities, becoming an important factor for urban and regional development. However, many implementation processes overlook an important aspect: the spatial dimension of circularity. Scholars have begun to advocate for “circular cities,” proposing frameworks that integrate economic, ecological, and social dimensions of circularity as part of spatial planning (Williams, 2021). Existing research neglects the challenges and values of marginalized populations, and frequently ignore to conceptualize the synergies among different factors of circular development. In addition, these research frameworks are primarily built upon Western experiences and perspectives, and there has been a notable lack of research drawing from Chinese cases, despite China’s significant role in advancing the circular economy agenda. This study aims to address these gaps by rethinking Williams’ circular development framework, structured around three interrelated goals: resource looping, ecological regeneration, and adaptation actions.

First, through a comprehensive literature review, this study aims to refine the framework to highlight the necessity of recognizing and supporting vulnerable urban communities as part of adaptive actions (here revised as *social adaptation*), while conceptualizing how these three dimensions interconnect. Second, by conducting a thematic analysis of China’s official policy documents on circular development, the study identifies specific development objectives, implementation methods, and pathways for each of these three goals in the Chinese context and examine how these are designed and intend to steer planning practice. The analysis will consider policy framing and planning documents at both the national and city levels, using several Chinese cities as examples.

The results of this policy analysis will offer new insights on the existing circular development frameworks more broadly and also specifically in the Chinese context. Preliminary findings suggest that resource looping, one of the components of circular development, in China, places strong emphasis on industrial efficiency and eco-friendly production systems, while urban waste management—though a component—often remains disconnected from enterprise-led resource looping efforts. Meanwhile, ecological regeneration initiatives in China concentrate on agricultural restoration to compensate for decades of rapid urban expansion and protect farmland for food security. Although resource looping and ecological regeneration are relatively closely linked—primarily through eco-friendly technological upgrades, urban blue-green infrastructure, and organic waste treatment—social adaptation receives limited attention. Multi-functional circular infrastructure, accessible social services, and community-learning initiatives are

largely siloed from the ecological and resource-looping agendas. These result in a fragmented policy environment that struggles to meet the specific needs of marginalized populations and undermines the broader goal of achieving sustainable and just urban transformations.

By conceptualizing how the three dimensions of circular development interact and complement one another within the policy goals, implementation pathways, and methods of circular development in the Chinese context, this study provides insights into pathways for promoting circularity through planning in the Chinese cities. It also provides insights for practitioners and policymakers seeking to advance post-growth urbanism by implementing integrated circular development strategies that balance ecological integrity and social equity.

T_01 POSTGROWTH URBANISM / 625

A new vocabulary for postgrowth transition in planning

Author: Barbara Pizzo¹

¹ *Sapienza Università di Roma*

Corresponding Author: barbara.pizzo@uniroma1.it

Urban planning has operated for over a century as the primary instrument of urban development, fundamentally equating development with growth (Pizzo 2023a, b, c; Savini et al. 2022; Rydin 2022; Xue, 2022). As we confront escalating environmental and social challenges, this traditional approach faces increasing scrutiny. While new theoretical frameworks emphasizing sufficiency, reduction, and downscaling principles have emerged to challenge mainstream planning orthodoxy, these approaches have yet to produce substantial changes in planning practices.

Current planning practices continue to define growth primarily through increases in building stock and economic value. Spatial plans are developed to maximize value creation, whether through suburban expansion generating absolute rent or through inner-city densification and various forms of urban regeneration producing differential rent. Even urban greening initiatives and climate crisis response policies often reinforce this growth-oriented paradigm (Conde et al. 2022), and “monetization” is often preferred as a solution than avoiding questionable urban transformation proposals (Lave & Doyle 2021). Many planning professionals view their discipline as inextricable from the current development paradigm, reflected in the renewed relevance of Jameson’s observation that “it is easier to imagine the end of the world than to contemplate the end of capitalism” (Jameson 1996).

Contemporary analysis of planning practices, particularly at the local level, reveals the persistent dominance of mainstream approaches. These practices remain firmly anchored not only in traditional concepts and norms but also in a vocabulary that perpetuates an increasingly contested pro-growth mindset.

Our research in Rome, Italy, provides the empirical foundation for examining critical elements that impede the transition from pro-growth to post-growth planning. We focus particularly on key planning concepts and policy tools, such as “compensation”, which in their current application obstruct meaningful change. Our analysis demonstrates why merely modifying existing planning tools while maintaining their growth-oriented framework proves insufficient for achieving genuine transformation toward post-growth cities.

Moreover, we illustrate how conventional planning vocabulary presents a fundamental barrier to more radical post-growth transitions. Our investigation proceeds through three main objectives:

1. Analyzing how growth assumptions embedded in planning tools and vocabulary perpetuate unsustainable development patterns
2. Examining specific cases where traditional planning concepts impede the implementation of post-growth approaches
3. Developing alternative frameworks that transcend the conventional equation of development with growth.

We aim to contribute to the broader post-growth debate by examining real-world planning practices and their limitations in achieving post-growth objectives. We provide both theoretical insights and practical evidence demonstrating how entrenched planning paradigms must transform to achieve genuine ecological balance and social equity. Our findings challenge the above-mentioned Jameson's observation about the difficulty of imagining alternatives to capitalism by demonstrating concrete ways to reconceptualize planning beyond growth-centric approaches.

Degrowth's identity problem: the regional politics of Vienna's 'breadbasket'

Author: Johanna Waldenberger¹

Co-author: Federico Savini¹

¹ *University of Amsterdam*

Corresponding Author: j.waldenberger@uva.nl

The article investigates how (bio-)regional identity mediates the rearrangement of urban-rural relations in the planning of sustainable regional economies. It researches the issue of identity within the emergent field of degrowth urban and planning studies. Degrowth scholarship largely neglects the issue of identity and can be accused of running the risk of co-option by far-right ideologies. Drawing on post-structuralist regionalism, we argue that (bio)regions and their identities are contested, power-laden constructs rather than

fixed entities. The paper focuses on the city-region of Vienna, and in the ‘operational landscape’ of Marchfeld as a case study. We examine how place-based identity is constructed by the actors involved to mediate the conflicts over city and rural areas around issues of agroecology, sand extraction, and the bioeconomy. The paper advocates for a more critical research on identity issues in degrowth research and its analysis in the construction of regional scales.

The Global Journey of Second-Hand Clothing: Key Actors and Local Dynamics

Author: Pedro Guimarães¹

¹ *Lisbon University*

Corresponding Author: pedroguimaraes@campus.ul.pt

In recent decades, growing pressure on the planet’s resources has sparked increasing concerns about sustainability and the need to mitigate the effects of human activities. To address these challenges, circular economy practices have emerged, focusing on reducing the over-exploitation of raw materials and extending the life cycle of products. The trade in second-hand clothing exemplifies this approach. Recently, this market has gained significant traction, particularly with the movement of garments from Global North countries to the Global South. In the GreenCCircuit project, we aim to explore how this global phenomenon unfolds and its local implications, using Mozambique and Mexico as case studies.

In this presentation, we will debate the specific contexts through which second-hand clothing emerges and develops in both countries, focusing on how second-hand items are mercantiled, even when their origins lie in charitable initiatives. Furthermore, we will share insights from our upcoming fieldwork in Maputo and Mexico City. Our preliminary findings reveal the intricate path that clothing takes from its initial entry into the cycle to its eventual placement in local second-hand markets. By examining these dynamics, we hope to deepen our understanding of the role that second-hand clothing plays in advancing sustainability and fostering circular economies across different contexts.

Operationalising adaptive planning in regulatory planning systems: Balancing Rigidity and Flexibility in Oude Dokken, Ghent

Authors: Silke Hoefkens¹; Thomas Machiels¹

¹ *University of Antwerp*

Corresponding Authors: thomas.machiels@uantwerpen.be, silke_hoefkens@hotmail.com

Comprehensive blueprint plans present a fixed end state for years or decades into the future, detailing elements such as land uses, zoning, and building regulations (Davoudi, 2021). Since the 21st century, criticism against blueprint planning has intensified, leading to a surge in adaptive planning concepts within planning literature, highlighting that blueprint planning is unsuitable for managing change and planning for uncertain futures (Rauws, 2017; Skrimizea et al., 2019). The core idea of adaptive planning is to make plans, projects, and urban areas adaptable to uncertain future changes (Pelzer & Pot, 2023; Skrimizea et al., 2019). This central characteristic is a significant aspect of various research strands that can be interpreted as adaptive planning concepts, some inspired by other disciplines. Simultaneously, adaptiveness has generally increased in spatial planning practices in Europe during the 21st century (Nadin et al., 2021).

Despite these theoretical and practical shifts, it is widely acknowledged that planning practices remain dominated by traditional approaches such as blueprint planning (Davoudi, 2021). While theoretical concepts abound, there is a shortage of empirical studies that deepen our understanding of how to operationalise adaptive planning within contemporary planning systems and practices. The few existing studies overlook how adaptive planning can be operationalised in current spatial governance and planning systems, which is crucial for translating theories into tangible approaches for practice.

In this paper, we aim to contribute to planning practice and research by addressing the research question: ‘How can adaptive planning be operationalised to prepare flexible plans and enhance the adaptivity of urban areas?’. We examine the Oude Dokken case, a large-scale urban redevelopment project ongoing since 2004 in Ghent, Flanders (Belgium), where practitioners consider it an example of adaptive planning despite Flanders’ (Belgium’s) rigid spatial governance and planning system (Lacoere and Leinfelder, 2023). This case offers valuable insights into how practitioners balance rigidity and flexibility in such a context. Data were collected through document analysis and semi-structured interviews with key stakeholders. We analyse both (a) the adaptive planning process across the planning, design, and implementation phases, and (b) the neighbourhood’s potential for long-term adaptivity, post-implementation. We propose a cohesive analytical framework examining four levels of planning practice: the planning and decision-making process, the strategic plan level (masterplan, visioning), the level of regulatory instruments (e.g., a land-use plan), and the project level (built environment and infrastructure). Additionally, we assess Oude Dokken’s potential long-term adaptivity potential by using Cozzolino’s (2019) characteristics of (anti-)adaptive neighbourhoods (AANs).

The empirical findings show how adaptive planning can be operationalised, despite constraints, even within a context of strong and continuous government control, and a rigid planning system, and that this can still lead to a potentially adaptive neighbourhood in certain respects. This suggests that planning practice can move forward and operationalize adaptive planning today, without radical institutional changes. Examples like Oude Dokken, which consciously complement traditional approaches with adaptive

planning rather than treating them as conflicting, support arguments for hybrid planning approaches that balance rigidity and flexibility.

Comparison of Retrofitting and Urban Renewal Processes in terms of Transaction Costs and Value Increase Effects: Case Study in Kadıköy

Author: Şevkiye Şence Türk^{None}

Co-authors: Nuray Çolak Tatlı¹; Sezen Tarakçı

¹ <https://www.mesken.org.tr/en/>

Corresponding Authors: turkss@itu.edu.tr, nuraycolak@mesken.org.tr

Urban areas face interconnected crises, including natural disasters, environmental issues, extreme climate changes, social and spatial inequalities, and displaced communities. Growth-oriented development models exacerbate these challenges by undermining ecological balance, social justice, and resilience. In Istanbul, a city with high earthquake risk and similar vulnerabilities, the need for earthquake-resistant housing is a pressing concern. However, renewal or retrofitting processes for existing buildings pose significant challenges for individuals and institutions alike.

Istanbul's location near active fault lines places it at serious risk of earthquakes. A large portion of its building stock was constructed before the 1999 Marmara Earthquake, rendering much of it non-compliant with modern seismic standards. This problem is compounded by the rapid and unplanned urbanization during earlier decades, often without proper engineering oversight. Consequently, it is critical to make Istanbul's buildings earthquake-resistant as quickly as possible.

The October 23, 2023 report by the Commission on Public Works, Reconstruction, Transportation, and Tourism highlights the urgency of this issue. According to the report, approximately six million houses across Turkey are at risk, with two million independent sections requiring immediate transformation. Since the enactment of Law No. 6306 in

2012, only 2.2 million independent units have been transformed, accounting for just one-quarter of the urgent need. The persistent disaster risks not only exacerbate physical vulnerabilities but also deepen social and economic inequalities. Low-income groups face significant barriers to accessing safe housing due to high costs and limited post-disaster response capacities. Addressing these risks in Istanbul requires inclusive and sustainable solutions that cater to both individual and societal needs.

This study examines the economic sustainability of urban renewal and retrofitting processes and their implications for spatial justice. It compares transaction costs and value increments associated with two housing projects in Kadıköy District, a hub for urban renewal and retrofitting in Istanbul. These projects were selected from non-conservation areas under the local spatial plan. The analysis spans the entire process, from initial decision-making to administrative procedures and implementation. Transaction costs, including time and monetary expenses for each step, are calculated. Furthermore, the study assesses changes in housing prices before and after renewal or retrofitting in the same locations.

Transaction cost theory offers a lens to analyze the expenses incurred during economic decision-making processes due to information asymmetry, bureaucratic barriers, negotiation challenges, and implementation difficulties. This theory is particularly relevant for understanding the complexities of urban renewal projects, where interactions between individuals, institutions, and public authorities play a pivotal role. Transaction costs extend beyond direct monetary expenses to include time, labor, and administrative efforts. Factors such as lengthy decision-making processes, collaboration with local authorities, and complex legal requirements significantly influence these costs. Understanding and addressing transaction costs is essential for developing policies and strategies that enhance economic sustainability and spatial justice.

The findings of this study are expected to highlight the differences in transaction costs between retrofitting and demolition-reconstruction methods and analyze how these differences impact housing value increases. While demolition and reconstruction projects typically involve higher transaction costs, they may result in greater market value appreciation than retrofitting. Conversely, retrofitting is anticipated to offer a more sustainable approach with lower transaction costs.

This study not only compares economic value and transaction costs but also underscores the importance of re-evaluating spatial planning processes through the lenses of justice, accessibility, and ecological sustainability. Given Istanbul's earthquake risk and economic constraints, the results provide valuable insights into how spatial planning can function as a transformative tool in times of crisis.

T_02 PLANNING AND LAW / 545**Exploring the Challenges of Integrating Nature-Based Solutions into Urban Planning Statutory Systems: A Case Study of Kaohsiung City, Taiwan****Authors:** YaZhen Cai¹; Tzuyuan Stessa Chao¹¹ *Department of Urban Planning, National Cheng Kung University, Tainan, Taiwan***Corresponding Authors:** tychao@mail.ncku.edu.tw, t900916@gmail.com

Under the dual challenges of climate change and urban sustainable development, Nature-Based Solutions (NbS) are one of the modern approaches to address environmental and social challenges. As an innovative strategy for urban sustainability, NbS has garnered widespread international attention (Nugent et al., 2015), and many countries have actively promoted its broad application. The Urban Nature Atlas (UNA) categorizes NbS based on the challenges faced by different regions and emphasizes the importance of bottom-up NbS implementation strategies. Also, in urban governance, uncertainties posed by climate change and the lack of site-specific governance strategies highlight the need for a comprehensive implementation framework (Castelo et al., 2023). Therefore, how to systematically and effectively incorporate NbS into urban planning statutory systems and practices remains a pressing topic in academic and practical fields.

In Taiwan, the "Nature-Based Solutions for Climate Change Adaptation Action Plan" meeting was firstly held in 2022 and followed by the Executive Yuan approved the "National Climate Change Adaptation Action Plan (2023–2026)" in 2023. The NbS was officially announced as a key concept in climate change adaptation strategies (Shih, 2024). Despite strategies of ecological protection and disaster prevention have been compulsory contents in the current statutory plan by law, the systematic application of ecological foundations integrated with NbS remains insufficient (Chou et al., 2023).

Furthermore, the practical application of NbS in Taiwan faces challenges due to urban spatial heterogeneity and high-density development. The local applications of NbS remain controversial. Kaohsiung City, the second largest municipality in Taiwan, has actively sought to transition from a heavy-industrial city toward a vision of smart innovation and green sustainable development in recent years, presenting an excellent opportunity for the introduction of NbS.

The study focuses on Kaohsiung City's urban planning system, selecting three types of spatial areas facing distinct challenges: industrial transformation and emerging urban zones (e.g., Asia New Bay Area), existing ecological protection zones (e.g., Shoushan Conservation Area), and historical cultural landscape areas (e.g., Yancheng District). The research employs Strategic Environmental Assessment (SEA) combined with an NbS relevance matrix to quantify the current state of NbS applications in urban planning documents. Additionally, through international case comparisons, this study examines differences in policy frameworks, technological applications, and social benefits, evaluating the status of NbS applications in various spatial contexts in Kaohsiung's urban planning while analyzing the potential and deficiencies in its implementation.

The expected outcomes of this study include: (1) clarifying the current status and limitations of NbS applications across different urban planning areas in Kaohsiung; (2) proposing policy integration and suggesting possible planning regulations/ zoning codes for the current urban planning statutory system for delivering feasible NbS strategies to enhance Kaohsiung City's resilience and sustainability. These findings aim to serve as a policy and practical reference for other cities, contributing to the dual goals of climate adaptation and sustainable development.

NAVIGATING UNCERTAINTY: THE ROLE OF PLANNING IN ISTANBUL'S BAGCILAR INDUSTRIAL DISTRICT

Authors: G. Pelin Olcay¹; Sezen Tarakçı²

¹ *Istanbul Kent University, Faculty of Art and Design, Department of Urban Design and Landscape Architecture*

² *Istanbul Technical University, Faculty of Architecture, Department of City and Regional Planning*

Corresponding Authors: sezentarakci@itu.edu.tr, pelin.olcay@kent.edu.tr

Turkey operates under a regulatory planning system; however, zoning plans allow for significant flexibility through plan notes. This flexibility often leaves urban development and transformation at the mercy of market dynamics. As a result, plans fall short of providing a clear vision for cities and fail to ensure sustainable urban development.

This study aims to explore how zoning plans struggle to guide urban development, using Istanbul's Bagcilar district as a case study. Bagcilar is a significant industrial district where rapid industrialization occurred during the 1970s. Since the 2000s, however, policies of industrial decentralization have been implemented. Consequently, while industrial activities have been relocated in certain areas of the district, they persist in others. The coexistence of industrial and other functions is largely facilitated by plan notes, which enable a wide variety of uses. For instance, in areas designated as Central Business Districts (CBDs) or Prestige Axes, zoning plans permit a mix of offices, hotels, residences, and even manufacturing. This uncertainty is evident as approximately 22% of areas planned as CBDs or Prestige Axes still accommodate manufacturing, while industrial activity is permitted in 45% of designated zones. Furthermore, research conducted in 2022 revealed that 75% of manufacturing firms prefer to remain in the area.

This study focuses on how zoning plans, while assigning specific functions to an area, create ambiguity through the variety of uses allowed by plan notes. This raises the question: How can such planning decisions result in diverse and divergent urban development and transformation? To address this, the study highlights how zoning plans in Bagcilar enable diverse—and sometimes contradictory—development scenarios. The development of these scenarios was supported by field studies conducted in the district between November 2022 and December 2023. These efforts included site surveys, in-depth interviews, sectoral workshops, and a detailed examination of planning processes. Based on the findings, three potential development scenarios were identified:

- i) Manufacturing and Housing-Oriented Transformation
- ii) R&D and Design based Manufacturing-Oriented Transformation
- iii) Housing-Oriented Transformation

Each scenario presents distinct implications for the population, employment opportunities, housing demand, socio-economic structure, and the social and technical infrastructure requirements of the district. However, there is no mechanism to assess which scenario aligns best with sustainable development goals or to implement measures toward that objective.

The study argues that zoning plans prepared under the regulatory planning system fail to effectively guide urban development due to the uncertainty created by plan notes. It also underscores the need for regulatory adjustments in planning systems to achieve sustainable urban growth.

Suburban Densification: Space, Strategies, and Land Policy

Author: Thomas Hartmann¹

Co-authors: Bénédicte Bucher²; Mathias Jehling; Sebastian Dembski³

¹ *TU Dortmund University*

In light of global ambitions to reduce land take and the need for housing, densification has become a prominent policy goal for urban development in many countries. While densification has been widely discussed in academia for the inner-urban realm, suburban areas have huge potential but are yet understudied. Densification of suburban areas, however, is from a spatial planning perspective much more challenging.

This contribution presents evidence of the international research project SUBDENSE from city regions in England, France and Germany. There are three main types of results: (1) Based on a geo-spatial analysis, it will be shown where densification takes place and the institutional drivers behind different types of densification. (2) The study then looked at the role of actors in suburban densification process based on interviews with landowners, residents, developers, planners and councillors to assess the agency that various stakeholders have in the densification process. Finally, (3) the study investigated the role of land policy in the densification process.

The results reveal that the main barrier to suburban densification is not so much due to resistance from landowners, but the passivity of local authorities as well as a lack of proper tools to have informed public debate and to contract with stakeholders. Our results encourage a debate on the role that suburban areas play in trajectories towards sustainable urban development.

Post-socialist and Western housing policies for densifying suburbia –Understanding and comparing German and Czech perspective

Authors: Jana Nádravská¹; Cornelia Roboger²; Katharina Künzel²; Thomas Hartmann²

¹ *Faculty of Architecture, Czech Technical University in Prague*

² *TU Dortmund University, Germany*

Corresponding Authors: katharina.kuenzel@tu-dortmund.de, jana.nadravska@fa.cvut.cz, thomas.hartmann@tu-dortmund.de, cornelia.roboger@tu-dortmund.de

Urban densification is increasingly advocated by planners throughout Europe as a viable solution to housing shortages and the reduction of land uptake. By optimizing existing urban spaces, densification promises to alleviate the pressure to develop greenfield sites, thereby preserving natural landscapes and promoting sustainable urban growth. Suburban areas have huge potential for densification, yet densification in these areas is barely in the focus of spatial planning and systematic implementation is often tardy. Existing property rights and stakeholder interests hamper development. Yet it can be expected that in different countries the hampering factors differ.

Western and post-socialist contexts deal differently with property rights and land policy. This study investigates possible soft densification of suburban areas in Germany, as a Western European state, and the Czech Republic, a post-socialist state, through the lens of three key research questions.

The first research question examines the historical development of suburbanization, analyzing how the trajectories differ between the Western and post-socialist settings. A comparative content analysis of literature explores temporal and quantitative distinctions, highlighting the role of property rights transitions—particularly in the Czech Republic's post-socialist privatization—in shaping suburban patterns.

The second research question investigates the morphological characteristics of suburban neighborhoods, comparing plot sizes, building layouts, built-up areas, and housing typologies (e.g. individual houses, row houses, duplexes) in the case studies of Prague and Dortmund suburbs. Using geospatial analysis, this study uncovers how spatial configuration and built environment in these regions can determine spatial reserves for soft densification, offering the most empirical insights of the research.

The third research question addresses governance perspectives, focusing on how soft densification is reflected in policy documents and perceived by municipal representatives. Data include interviews, legislation, and strategic documents, analyzed through keyword searches and qualitative coding. This research highlights how property rights frameworks—such as land-use regulations and ownership constraints—shape the feasibility and implementation of densification policies, revealing differences in institutional approaches and municipal practices.

By integrating historical, morphological, and governance perspectives, this study elucidates the interplay of suburbanization, property rights, and densification policies in Germany and the Czech Republic. The findings contribute to a deeper understanding of how socio-political and legal contexts influence suburban development and offer valuable insights for spatial planning and housing policy.

Soil Consumption and Logistics Hubs: Castel San Giovanni, the Milan Logistic Region's Gateway to Emilia-Romagna

Author: Margherita Emilia Re¹

¹ *Politecnico di Milano (IT) - Zhejiang University (CN)*

Corresponding Author: margheritaemilia.re@mail.polimi.it

The establishment of logistics platforms in medium-to-small-sized municipalities has increasingly contributed to soil consumption, significantly impacting northern Italy in recent years and generating notable side effects. This issue is particularly evident in the province of Piacenza, Emilia-Romagna, which hosts a cross-border logistics network of major European significance, known as the Milan Logistic Region. This research examines the implications of this phenomenon through an in-depth study of the Logistic Park in Castel San Giovanni, one of the largest logistics hubs in northern Italy. Castel San Giovanni is a small town with fewer than 15,000 inhabitants, yet it has undergone significant transformations due to the expansion of logistics infrastructure.

The paper investigates the development of the Logistic Park as a case study to assess the impact of Emilia-Romagna's Regional Law No. 24/2017 on soil consumption. This legislation serves as a key example of how large-scale transformations have been regulated in recent years, particularly in light of the European directive targeting zero land take by 2050. The analysis traces the legislative process and the origins of the logistics hub, which evolved through a series of approvals outside the main urban planning framework. This fragmented approach has resulted in a settlement that is poorly integrated into the pre-existing urban fabric.

By examining the development of the logistics hub and its broader impacts, the research ultimately proposes measures to reinforce the provincial green network. These include rethinking the role of private stakeholders in ecological and environmental compensation agreements, positioning the logistics hub as an opportunity to foster sustainability. Finally, the paper reflects on the feasibility of steering the hub's evolution towards greater sustainability, adaptation, and resilience—key imperatives in addressing contemporary urban and environmental challenges. The case study highlights the risks associated with fragmented planning processes, which often prioritise private interests and rapid implementation over integrated, long-term strategies for the common good.

Study on the current status and issues of urban regeneration development in Yokohama City

Author: MUHAMMAD AINUN FIKRI¹

Co-authors: MASAHIKO NAKANISHI²; Ihsan Imawan³

¹ Ph.D. Student, Graduate School of Urban Social and Cultural Studies, Yokohama City University

² Graduate School of Urban Social and Cultural Studies, Yokohama City University

It has been about 20 years since the Urban Renewal Special Measures Act came into force in June 2002. Under this Urban Renewal Special Measures Act, Urban Renewal Special Districts are a planning consultation-type deregulation method that allows deregulation of floor area ratios, etc., in urban development projects within urban regeneration emergency development areas, depending on the contribution to urban regeneration proposed by the business operator. This is very different from pre-determined deregulation methods such as specific blocks and comprehensive designs, in which the relaxation of floor area ratios, etc. is clearly stated depending on the quantitative level of

contributions in specific fields (public space, pedestrian-only roads, disaster prevention, environment, scenery, use, etc.).

At first glance, the Urban Renewal Special Measures Act seems very good and is a reason to improve the economy, but the problem is how the incentives given to Urban Renewal Special Districts, that is, the balance between the relaxation of floor area ratios and the public contribution plans, are balanced. The current Urban Renewal Special Measures Act does not provide detailed provisions on the scope of public contributions or the number of achievements, so businesses can easily obtain incentives by simply bearing the public burden as is. The public contributions required of Urban Renewal Special Districts include not only space but also buildings and environments that have a positive impact on the environment. This public contribution also becomes problematic if there are no detailed regulations on what materials are used and what environmental impact is required to obtain the incentive. Recently, the construction of hotels, MICE, meetings for companies, incentive travel for companies, international conferences for international organizations, associations, academic societies, exhibitions, trade fairs, and events can receive incentives as public contributions in the Urban Renewal Special District. It is very easy for business proponents, and they can get incentives for floor area ratio relaxation just by building a conference room or exhibition room on a few floors of an existing building. Although the current regulations do not specify in detail, the most important thing is the evaluation, decision-making power, review, and supervision of the project from the city to the central government on what kind of public contribution will be built and whether it is worth building.

This study is in Yokohama City, and since 2002, it has been collecting and organizing planning data on public contributions (public spaces, pedestrian-only roads, disaster prevention, environment, scenery, use, etc.) and floor area relaxation from businesses and the government. Collect and organize data not only from within the specific urban regeneration emergency development areas but also from the surrounding areas. Display urban spatial data using GIS. Conduct literature research on the process from planning to deciding on each project, and organize the council, environmental impact assessment, and urban beauty measures council. Conduct a hearing survey of Yokohama City, the stakeholders most involved in the process, and organize the data.

Future Zones: Legal Innovations for Adaptive and Equitable Spatial Development

Author: Luis Hilti¹

¹ *University of Liechtenstein*

Corresponding Author: luis.hilti@uni.li

The increasing rigidity of legal and regulatory frameworks in spatial planning has hindered the ability to address contemporary challenges, including climate adaptation, demographic shifts, and rapidly changing local needs such as housing shortages or surpluses. Zoning, often criticized for perpetuating outdated models rooted in modernist or neoliberal priorities, has emerged in new forms with a different normative orientation. Future Zones represent an innovative reimagining of traditional regulatory instruments, enabling flexibility, sustainability, and equity while countering legislative inertia in urban and regional development.

This paper explores the legal underpinnings and characteristics of these “third-generation zones,” focusing on their role as catalysts for systemic change. Using a comparative and systematic approach, the study examines key dimensions:

1. **Time** –The legal mechanisms governing the longevity, adaptability, and dissolution of zones.
2. **Form** –How legal frameworks influence the evolution of zone boundaries and their prescribed dynamics.
3. **Goal** –The ideological and practical objectives encoded in zoning regulations.
4. **Emergence** –The conditions under which zones arise, contrasting top-down imposition with collaborative, stakeholder-driven planning.

By situating “Future Zones” within existing legal frameworks, this paper demonstrates their potential to reconcile tensions between public and private rights, foster inclusive governance, and create equitable and resilient urban spaces. The findings provide actionable insights into how planning law can evolve to meet the challenges of sustainability and just transitions in times of crisis.

The relationship between urban planning and crisis management from the perspective of legal instruments in Poland.

Author: Aleksandra Karpińska¹

Co-author: Robert Idem¹

¹ *Gdansk University of Technology*

Corresponding Author: aleksandra.karpinska@pg.edu.pl

Urban areas are increasingly vulnerable to natural and man-made disasters, exacerbated by factors such as dense populations, inadequate infrastructure and unplanned development. Such disasters can have devastating consequences, including loss of life, economic disruption, and social upheaval. Recognizing the critical importance of urban resilience, experts and scholars stress the need for strategic planning and the development of sound emergency shelter systems (Zhu et al., 2023) for the safety and sustainable development of cities and enhancement of disaster management (Wei et al., 2020). These shelters should serve as vital lifelines, providing refuge, essential services, and a sense of security to the affected populations. As emergency planning determines the conditions of shelter for those displaced by an emergency, it also influences the design of everyday urban spaces. The process of formulating an emergency plan is similar and parallel to urban and regional planning. Unfortunately, the two disciplines are seldom sufficiently linked and exchanged, yet they have much in common. This study examines the critical role of urban emergency shelters in the overall urban system, providing an

expertise of the legal instruments in Polish crisis management from local and supra-local perspectives and their relevance for effective urban planning in multi-risk situations. The Crisis Management Act describes the activity of public administration bodies as part of the management of national security. Despite many years of legislation in the field, the system has been defragmented due to the lack of relevant regulations. It also considers protective facilities and buildings and their condition in Polish cities, which has been severely neglected for decades. At the same time, the newly introduced Civil Protection and Civil Defence Act imposes new tasks on civil protection authorities to improve prevention and preparedness for possible incidents. Therefore, documents related to emergency situations at national, regional and local level over the last 20 years have been compared in terms of their contribution to spatial planning and building law. Key issues have been diagnosed based on the conditions and limitations identified. The results of the study highlight the need to improve the relationship between urban and emergency planning for non-emergency and emergency wellbeing and place-making in the urban fabric by introducing provisions (in the form of relevant regulations in spatial law) that specify detailed rules for the planning, design and distribution of emergency services.

How and why do municipalities regulate urban environments: Comparison across Europe

Author: Daniels Saakjans¹

Co-authors: David Kaufmann²; Anna M. Hersperger³

¹ *Swiss Federal Research Institute WSL; ETH Zürich*

² *ETH Zürich*

³ *Swiss Federal Research Institute WSL*

The rapid growth and increasing complexity of European cities underscore the critical need for spatial planning to ensure sustainable urban environments. Within spatial planning, local land-use planning is translating strategic goals into legally binding regulations. Making up a big part of land ownership and development law, local-level regulations directly shape cities by controlling their physical components, such as buildings and open/green spaces, and allocating land for different activities and uses, e.g. residential, commercial, industrial, etc. However, land-use regulations used across European cities are highly diverse as municipalities have a lot of freedom in designing regulations to address their local needs. Moreover, the development of regulations is often a practice-led process and not theory-driven. Thus, our understanding of how and why urban environments are regulated on the local level remains poor as we lack systematic analysis and comparative research.

So far, comparisons of spatial planning across Europe (Berisha et al., 2021; Knieling and Othengrafen, 2009; Newman and Thornley, 1996) have predominantly focused on legal-administrative frameworks but largely neglected local land-use regulations. An exception is the COMPASS project (Nadin et al., 2024) which looked at the diversity of local planning instruments, such as local plans, in 32 European countries. The project identified 251 types of instruments and categorised them according to the envisioned functions into four categories. 76% of all “local spatial planning” instruments fell into one category, which indicates the need for a more detailed approach. Moreover, the project did not analyse the individual regulations that comprise these instruments, such as regulations limiting building height or protecting urban trees. A focus on regulations is promising since regulations are the law-based building blocks of any planning system and, thus, essential for understanding the differences and commonalities in how and why municipalities and countries plan and regulate urban environments. Thus, we seek to develop a European overview of spatial planning based on regulation-level detail and the regulatory profiles of countries.

We analyse how local land-use regulations are prioritised in the planning and permission-granting process and the extent to which they pursue efficiency and equity objectives. Efficiency and equity are two primary objectives of planning (Vejchodská et al., 2022) where efficiency stands for the most effective use of resources aimed at supporting economic growth and social well-being, and equity refers to a fair distribution of resources aimed at addressing disparities and inequities. The data is collected with an online survey of planning professionals and academics across 31 European countries. In order to develop country profiles, we classify regulations into three main categories –those regulating buildings, open/green spaces, and those determining the use of land. Within these, we examine subcategories, e.g. subcategories of building regulations include those controlling height, volume, density, etc., to understand planning priorities and objectives. Together, results on subcategories create unique regulatory profiles of countries which are then analysed and compared.

We found that certain regulations are common throughout Europe and that others are more context-specific. Some are efficiency or equity-driven, while many are pursuing both goals. Preliminary results show that it is possible to develop regulatory profiles for individual countries, though there is considerable overlap. The discovered groups of common country regulatory profiles add to the aforementioned comparative research on European planning by providing new insights into the relationship between legal-administrative frameworks of planning systems and the nature of their local regulatory practices. Thus, the findings of this study will contribute to comparative research on European land-use regulations.

T_02 PLANNING AND LAW / 1161**A Policy Approach to the Use of Retrofitting in the Turkish Planning System****Author:** Sevkiye Sence TURK^{None}**Corresponding Author:** turkss@itu.edu.tr

Due to its geographical location, Turkey has been and will continue to be exposed to major earthquakes at different times. This situation requires new buildings to be constructed with the performance to meet the earthquake risk on the one hand, and on the other hand, it requires the existing building stock to be made earthquake resistant. For second situation, two important policies in different countries come to the fore. The first one is the retrofitting of existing buildings in terms of earthquake preparedness, while the second one is earthquake-oriented urban renewal, which envisages the demolition and reconstruction of existing buildings. However, instead of integrating these two policies, governments mostly favour the latter. The main motivation behind such a preference is the pressure of the real estate market, the expectation of high earnings in a short time, and the recognition that construction-led growth increases GDP and employment.

A similar approach has been adopted in Turkey. As a matter of fact, after the 1999 Marmara Earthquake, earthquake-focused urban renewal approach was adopted in order to strengthen the existing building stock and the main justification was determined as earthquake in different urban renewal laws enacted since 2004. Especially in the 'Law on the Transformation of Areas under Disaster Risk', which entered into force in 2012, although the use of urban renewal at both single parcel (building) scale and spatial scale is introduced, urban renewal at single parcel (building) scale is mostly used. However, the idea of applying only urban renewal to all existing building stock in order to improve the building stock in Turkish cities against earthquake risk is not realistic in terms of both financial resources and ensuring improvement in a short time.

While it is stated that the transformation of 2 million 200 thousand independent units across the country has been completed since 2012 when the Law No. 6306 entered into force, it is emphasised that only one fourth of the independent units that need to be transformed have been transformed in the 11 years in question. However, it is stated that approximately 6 million dwellings are under risk throughout the country and 2 million independent units need to be transformed urgently. Such a picture indicates that the other option, retrofitting, should also be used as a tool. However, neither the international literature nor the national literature sufficiently emphasises the use of 'retrofitting' as an option, and it also shows that governments and landowners have a negative bias towards retrofitting. On the other hand, the importance of a mixed approach where different policies can be used together instead of a policy dependent on only one tool in earthquake risk reduction has not been discussed. Is it possible to use 'retrofitting' and 'urban renewal' in earthquake risk reduction not as alternatives but as complementary policy approaches? While there are several studies on the use and management of 'retrofitting' in earthquake risk reduction, there are no studies that focus on the dilemma of 'retrofitting' and 'urban renewal' or how these two tools can be used in an integrated manner in earthquake risk reduction.

This paper analyses the dilemma of 'Retrofitting' and 'Urban Renewal' for earthquake preparedness with its legal dimensions and discusses the question of how the two policies can be integrated on the case of Turkey. Focusing on literature review as a methodology, the paper analyses the practices and results of retrofitting existing buildings for earthquake preparedness after 2000. The findings of the study can contribute to policy approaches in earthquake-prone countries with problematic existing building stocks by analysing the dilemma of 'retrofitting' and 'urban renewal' in a comparative and holistic manner.

EXAMINING THE EFFECTS OF SHORT-TERM RENTAL REGULATIONS: THE INS AND OUTS OF ISTANBUL

Authors: Basak OZEN^{None}; Dicle KIZILDERE^{None}

Corresponding Authors: bozen2023@gtu.edu.tr, diclekizildere@gtu.edu.tr

The short-term rental (STR) market has undergone substantial expansion in recent decades. This expansion has been particularly marked in the case of Airbnb, which has led to a proliferation of complexities and challenges, impacting a diverse range of stakeholders, including local residents, the hotel and hospitality industry, operators of STRs, and governmental authorities. While this development has facilitated experiences that are more personalised, localised and authentic, aligning with the romantic vision of the sharing economy and evolving consumer preferences, it has concomitantly given rise to socio-economic and regulatory issues that require urgent monitoring and resolution. These socio-economic and regulatory issues include gentrification, commodification and the reduction in the affordability of housing, as well as the disturbance of local residents and their daily lives. This rising awareness of the potential adverse implications has led to the introduction of new governmental legislations. Nevertheless, the efficacy of these measures remains a subject of debate. A particular difficulty for governments and policymakers is the challenge of implementing regulation on a global level at the local level. While the rationale for regulation may be similar, the regulatory approach varies depending on contextual factors such as the local political context, housing markets and the perceived impact of STRs. The majority of extant research has not, however, addressed these subtle contextual factors in a nuanced manner. As a consequence, a number of significant mechanisms and dynamic forces that determine regulatory pathways have been overlooked. This paper seeks to address this gap by focusing on the Istanbul case.

In Turkey, the central government enacted STR regulation legislation, commonly referred to as the “Airbnb Law,” in October 2023. This legislation, formally designated as Law 7464, is entitled “Law on the Rental of Residential Properties for the Purpose of Tourism and the Amendments of Certain Laws.” The study will demonstrate that, while the government has succeeded in curbing the growth of the city's STR market to a certain extent through a decline in Airbnb rental listings, the increase in daily rates for Airbnb properties represents an undesirable consequence. This may lead to increased interest from the market as a result of the growth in the rent gap. It is further posited that the growth in the number of multi-hosts and the emergence of new actors in the form of companies that provide intermediary services are indicative of the ongoing professionalisation of the host structure. This transformation is believed to present a potential risk of increased real estate value and profitability. Furthermore, the privileges and flexibility permitted by legislation to certain types of buildings may give rise to conflicts with the public interest, and may also prompt commercial actors to utilise it as a marketing strategy for prospective housing and investment in STRs. While the regulatory framework for STRs in Istanbul remains in its embryonic stages, these issues give rise to the question of the extent to which the regulations are possible, effective, and, most crucially, to whom they serve the greatest interest.

Legal Pathways for Urban Mobility Resilience: A Content Analysis of Policy Documents for Istanbul's Transport Systems

Author: Burcu Soygüzeloglu¹

Co-author: Tüzin Baycan²

¹ *Gebze Technical University*

² *Istanbul Technical University*

Corresponding Authors: bsoyguzeloglu@gtu.edu.tr, tbaycan@itu.edu.tr

Urban transport systems are increasingly susceptible to natural hazards and climate-induced disruptions by posing significant challenges for urban resilience and public safety (Mattsson and Jenelius, 2015; Priolo et al., 2023). Ensuring the continuity of transport networks during and after crises is critical for both economic stability and sustainable urban development (Yang et al., 2022). Istanbul, a megacity exposed to seismic risks and climate-related hazards, exemplifies these challenges with its complex urban mobility landscape.

This study investigates how disaster resilience strategies are incorporated into Istanbul's transportation policy and legislative frameworks, which emphasizes the role of law as a catalyst for resilient urban transformation. Using a dataset of 35 policy documents (14 national and 21 local) and employing qualitative content analysis with MAXQDA software, this research systematically evaluates the presence and coherence of resilience-related strategies across multiple policy levels. The analysis is guided by a structured codebook covering seven core categories: (1) governance and policy resilience, (2) risk management and disaster preparedness, (3) physical and structural resilience, (4) operational resilience and service continuity, (5) social resilience and equity, (6) economic and financial resilience, and (7) alignment with international policy frameworks. Sub-codes such as policy integration, risk identification, and infrastructure robustness further refine the assessment criteria. This codebook guides the analysis, which incorporates frequency analysis, code co-occurrence analysis, comparative analysis, and Word Frequency and Keyword-in-Context analyses.

The results reveal critical gaps in the legal frameworks governing urban resilience in Istanbul's transport policies, particularly regarding policy integration, equity in disaster preparedness, and alignment with international resilience frameworks. Findings highlight inconsistencies in the enforcement of disaster preparedness measures across governance levels and an uneven distribution of resilience strategies across policy categories.

A significant contribution of this study is its identification of areas where legal reforms and policy adjustments can strengthen disaster resilience within Istanbul's transportation planning framework. Key recommendations include enhancing the clarity and enforceability of resilience measures in both national and local legislation by fostering multi-level governance collaboration. This research offers theoretical and practical insights into the intersection of spatial planning law and disaster resilience by emphasizing the critical role of legal frameworks in shaping adaptive, equitable, and sustainable urban mobility systems. By presenting policy misalignments and resilience gaps, it aims to inform policymakers seeking to enhance disaster preparedness and transport resilience in high-risk urban environments.

Nature and legal framework of the Privately Managed Public Spaces: opportunity or risk for a just city? The case of Milan

Author: Antonella Bruzzese¹

Co-authors: Alessio Sardo²; Gaia Bacciola ; Giulia Anselmo³; Matteo Timo²; Giovanni Botto⁴

¹ *Politecnico di Milano*

² *Università di Genova*

³ *Università di Siena*

⁴ *University of Genoa*

Public space's role in urban quality is widely known: it defines the city's structure, provides material support for community life, and represents civic and religious powers and values. The mechanisms of public space production are manifold: they can be either the result of an urban plan realized by the public entity on public areas, or the result of more complex urban projects promoted by private actors, in compliance with the national laws and policies.

Public space has assumed an even more crucial role in urban transformation processes in Western cities that no longer expand, but regenerate under increasingly frequent conditions of scarce - spatial and economic - resources. Public space is not only the share to be reserved to the public entity to guarantee the urbanization charges due, but it has become an asset that gives value to investments and projects.

Privately Owned Public Spaces (POPS) are a typology of spaces consolidated in the Anglo-Saxon environment and tradition (Kayden, 2000). Similarly, what we call Privately Managed Public Spaces (PMPS) are also spreading in other countries where public space was traditionally owned (or sold for public use) and managed by the public, multiplying the ways in which private actors conduct the management dimension (Carmona et al. 2008). How this management is done and its implications and effects are still to be investigated.

The paper intends to discuss the first outcomes of ongoing research conducted by an interdisciplinary group of urban studies and administrative law scholars on Privately Managed Public Space in Italy, specifically in Milan. Milan is an interesting case study for several reasons: it is a city in which the real estate market has been quite active in the last few years, carrying out several interventions that have also involved the realization of spaces for public use; there have been several experimentations of public-private agreements of various kinds with different actors and subjects (from the third sector to associations to developers); public space has been placed at the center of the urban strategies of the last urban plan, both at the urban and neighborhood scale.

The paper provides an initial taxonomy of cases in which private entities manage public spaces of different natures, of whom it analyses the legal framework (the covenants, agreements, and contracts that define the public-private partnership on their management). In order to make explicit the nexus between nature, uses, management of spaces, and their publicness and to understand if and how these forms represent an opportunity for local authorities in economically weak conditions to manage better and maintain public space or risk for accessibility and the public dimension and to reflect on what cautionary guidelines are needed to guarantee a broad right to the city (Lefebvre 1968, Fainstein 2010, Gehl 2010)

Understanding the nexus between the nature of the analyzed public spaces (dimensional characteristics, material qualities, uses and urban role) and their forms of maintenance and management (defined by different legal frameworks) means bringing different disciplinary fields - urban analysis, ethnography, planning, legal studies, and administrative law - into tension in order to understand their mutual interdependency and what is needed to grant their publicness.

Land ownership and cultural landscape patterns A case study of the Upper Horehronie, Slovakia

Author: Daniela Hrabovská¹

Co-author: Vladimír Ondrejčka¹

¹ *Ústav manažmentu*

Corresponding Authors: vladimir.ondrejcka@stuba.sk, daniela.hrabovska@stuba.sk

The paper presents various forms of ownership in Slovakia, their historical context and changes over time. The theoretical part focuses on the forms of land ownership relations in Horehronie, their specifics, uniqueness and use in the past. Results from field research, structured interviews and simple cartographic methods applied to the case study of Horehronie, provides an exploration of these forms of ownership relations and their functioning in the present. Specifically, the research will focus on the Upper Horehronie region. The choice of the Upper Horehronie case study area is based on previous knowledge and also on research that has been carried out in this area. The natural boundaries of Horehronie and the economic isolation of the area have elevated the territory of the Upper Hron into a separate cultural area. With the stabilisation of the settlement structure, the emergence of feudalism and the establishment of land ownership in the 11th century in what was then Hungary (today's Slovakia), a diversified traditional landscape emerged, which was shaped mainly by the influence of ownership relations. The Hungarian law of inheritance, which ensured the inheritance of land among all descendants, formed the basis of a small-scale structured agricultural landscape. These ownership relations have had a significant impact on the way the landscape continues to

function, extending into the present day. The basic forms of property law that will be discussed in this article are private ownership and fractional undivided ownership. These forms of private ownership and fractional ownership have had and continue to have significance and relevance to land use today. In addition to private ownership of land farmed individually by individual owners, there were also forms of collective farming in the Horehronie region on land that was indivisibly owned by a collective. The forms of undivided share ownership in Slovakia include land communities: forest communities and pasture communities. Forest and pasture communities were also in existence in the past in the Horehronie region. They laid the historical foundation and the relationship with the landscape. Of these, the forest community form has been preserved. In Slovakia, the current challenge is to make effective use of these forms of ownership relations for the efficient use of land. It is land management that is a key instrument for improving the structure of the landscape in Slovakia. In 2019, the Government of Slovakia approved the Draft Measures for the accelerated implementation of land adjustments, which have no legislative basis. The essence of these measures is to carry out land adjustments, in all cadastral territories in Slovakia, if they have not yet taken place in a given cadastral territory. These land adjustments have the potential, particularly in relation to the efficient use of land, the expansion of a number of landscape features, the increase of biodiversity in the landscape and, last but not least, the promotion of a sustainable cultural landscape. By linking to historic functioning communities, they can also be the basis for large-scale changes in the future in the context of landscapes that can be seen as part of our identity. Theoretical research, field research and structured interviews with interested communities capture a changes over time in the landscape of Horehronie. An assessment of the current state of private and share ownership in Horehronie, contributes significantly to further research and upcoming land reform in Slovakia.

Climate adaptation in multi-level legal and planning policy frameworks: using spatial justice to identify barriers to meaningful implementation

Author: Kat Fradera¹

Co-authors: Giedre Jokubauskaite¹; Larissa Naylor¹

¹ *University of Glasgow*

Corresponding Author: kat.fradera@glasgow.ac.uk

Coastlines and estuarine river edges are changing. With sea levels rising, and continued coastal protection increasingly being financially and practically unviable, increased thought is being given to managing a retreat from vulnerable areas along urban river edges and coasts and learning to live with water. Flooding, however, isn't just about waters rising. National and international laws, policies, economic frameworks and social processes produce and sustain unjust impacts from natural processes. Through decoupling the risk factors of hazard, exposure and vulnerability and applying a spatial justice methodological framework to coastal adaptation, the ethical, socio-economic and environmental challenges working with adapting to a changing climate can be better understood.

Working in the United Kingdom context this research seeks to understand how national, regional and local legal and planning governance, funding and land ownership frameworks enable or limit adaptation planning. Increasing this understanding allows for the

implementation of adaptation pathways to be understood in their wider socio-spatial context. The planning and legal systems that apply to local and regional spatial decisions are often the locus for concept conflicts between present and future land uses. As the need to implement climate adaptation 'on the ground' increasing in urgency, understanding how this agenda can be supported by current legal, land ownership and planning policy frameworks is crucial for enabling resilient places for future generations.

This talk asks the question "why is climate adaptation so difficult to implement?". It works towards an answer by exploring the legal and policy frameworks, along with land ownership regimes, into which 'adaptation thinking' is being applied. With a focus on coastal adaptation, the challenges faced in contending with an increasingly (anthropogenically) hostile climate are grounded in legal theory, planning law, land ownership and overarching governance frameworks. The spatial justice lens is useful here in that it allows us to develop a deeper understanding of the challenges of implementing adaptation pathways.

This analysis of multi-level governance, across law, policy and land ownership, allows us to explore where adaptation has the power to enact change within current land management and planning frameworks. At which level of governance does adaptation need to be championed in order for implementation to occur? Where are the windows of opportunity, and where are the barriers for successful, inter-generationally just outcomes?

The role of planning law in regulating urban ventilation: The case of Poland

Author: Mariya-Veronika Mochulska¹

Co-author: Katarzyna Zielonko-Jung¹

¹ *Gdansk University of Technology*

Corresponding Author: vermochu@pg.edu.pl

In the face of the climate crisis, compact development is becoming a challenge to provide adequate urban ventilation. Dense, high intensity building development reduces wind velocity, leading to stagnation and accumulation of pollutants in the air and an increase in the urban heat island (UHI) phenomenon (Poćwierz & Zielonko-Jung, 2021). In turn, air pollution and the UHI phenomenon negatively affect the quality of life of residents and the environment (Erell et.al., 2015). These phenomena also have a negative impact on human health. Every year, the number of people suffering from illnesses and dying due to higher temperatures and poor air quality increases worldwide (Banach, M. 2022; Shi L. et.al.2020).

This study analyses the legal instruments in force in Poland at different scales of city planning (micro, meso, macro) and their relevance to the effective management of urban ventilation. The changes in regulations over the last 20 years in Polish cities were compared in terms of their adaptation to the need for urban ventilation. Key areas for improvement were diagnosed. The results of the study highlight the need to develop consistent regulatory guidelines for a more sustainable and healthier urban environment.

Suing Like a City: How plaintiff cities pursue climate litigation against the state and corporations

As in previous waves of public interest litigation (Morris 2016), plaintiff cities are turning to the courts in their efforts to seek climate justice against more powerful opponents. But can, and are, cities leading the way on climate justice? Here we analyse plaintiff city litigation with a climate-relevant purpose –what we call ‘city climate litigation’–as the latest incarnation of an old strategic tool to pursue climate action and fairer, more effective climate governance (Swan 2018). We analyse 97 city climate litigation cases collected from international legal databases, with a focus on the unique city interests plaintiff cities seek to protect through litigation (Clopton and Shoked 2023). We summarise our review with key statistics and geographical trends (cf Setzer and Higham 2024). We then turn to discuss cities’ climate litigation strategies in more detail, including what challenges cities face and how cities contribute to broader climate litigation. Our analysis is divided in two based on the category of defendant: claims against the state and claims against ‘carbon major’ corporations. This reflects basic differences in the nature of cities’ legal claims against each type of defendant, as well as the different strategies and challenges used against each. We find that many city climate litigation cases remain pending before the courts. However, we demonstrate that cities led previous waves of climate litigation and currently lead many pending ‘second wave’ cases identified in the broader climate litigation literature (Setzer and Higham 2024). But how long will cities continue to lead the way on climate justice in the courts? We conclude with key cases to watch in the years ahead and some reflections on the limits of city climate litigation, based on historical dynamics in public interest litigation.

Local governments' strategies of linking affordable housing with urban village redevelopment in China: Reallocating property rights

Author: Jinshuo Wang¹

¹ *Israel Institute of Technology*

Corresponding Author: nju1127095@gmail.com

Linking affordable housing with urban redevelopment has emerged as an approach to promoting housing affordability in cities facing fiscal constraints. Drawing on the case of China, the research explores why and how local authorities use innovative strategies to secure affordable housing through urban village redevelopment. By conceptualizing the implementation of innovative instruments as a process of gradual institutional change in property rights regimes, the research has three key findings. First, struggles to balance political tasks of affordable housing provision and land constraints drove local authorities to experiment innovative strategies. Second, the innovative strategies reallocated a bundle of property rights among local governments, urban villagers and developers in urban village redevelopment. Third, the distributional effects of the strategies hinder the institutionalization potential. The research contributes to deepening the understanding of institutional change and highlights the distributional implications of property rights regimes. Besides, it offers insights into local governments' agency in urban governance.

Use of New Municipal Fiscal Powers for Sustainable Urban Development: Development and Application of a Strategic Financial Planning Method in the City of Mascouche, Québec (Canada)

Authors: Fanny Tremblay-Racicot¹; Jérôme Couture¹; Léa Béliveau¹

¹ *École nationale d'administration publique (ENAP)*

Corresponding Authors: lea.beliveau@enap.ca, jerome.couture@pol.ulaval.ca, fanny.tremblay-racicot@enap.ca

Over the years, the Government of Québec has granted Québec municipalities extensive monetary levy powers. Aiming to enhance their autonomy and recognize their role as proximity governments, the provincial government provided municipalities with general taxation and regulatory charges powers in 2018 (Tremblay-Racicot et al., 2023). In 2023, additional powers were introduced, enabling municipalities to vary property tax rates based on different sectors or any characteristic of the property assessment roll, excluding the property's value.

Although these new powers do not render municipalities fully financially autonomous, they allow diversification of revenue sources and reduce dependence on property taxes (Federation of Canadian Municipalities, 2024). They also offer opportunities to achieve various public policy objectives, such as mitigating or adapting to climate change, combating land speculation, or promoting a circular economy, through ecofiscal measures or by making property taxes more progressive. For instance, municipalities can impose regulatory charges targeting major traffic generators to encourage transportation management plans, tax vacant land or buildings, address underdensity through floor area ratio taxes, or impose higher tax rates on luxury properties ("monster houses") and lower rates on denser housing or areas with vulnerable populations.

In a pre-electoral context, many municipal officials and managers are questioning how to prudently use these new legislative powers, particularly as cities have historically tended to keep tax rates low while relying on new property assessments to grow their tax base. To address this, the City of Mascouche, located in Quebec, sought the services of our research team to assist in identifying and planning fiscal measures to prioritize over the next five years. This collaboration resulted in the December 2024 submission of a 2025–2030 Strategic Revenue Plan, offering recommendations to guide the City in prioritizing and phasing the deployment of fiscal tools (Tremblay-Racicot et al., 2024).

This paper aims to showcase the novel methodology developed to identify priority measures among over 25 documented fiscal tools. These tools were selected based on a diagnostic assessment of the City's financial profile and four prioritization criteria: (1) fiscal potential; (2) sound administrative management, including legal risks; (3) social acceptability and equity; and (4) environmental efficiency. The application of these criteria will be detailed, as well as the final choices made by the municipal administration and elected officials.

While these decisions reflect difficult trade-offs between fiscal potential and environmental efficiency, administrative simplicity and legal risk emerged as dominant factors guiding the choices. The co-development process and exploration of new possibilities also led to the prioritization of innovative, progressive fiscal measures that are environmentally sustainable. Combined with measures adopted in other Quebec municipalities, these advancements suggest a paradigm shift in the financial planning approaches of Quebec municipalities.

T_02 PLANNING AND LAW / 1897**No net land take? A uniform European policy but varying regulations and property rights****Author:** Rachelle Alterman¹¹ *Technion - Israel Institute of Technology***Corresponding Author:** alterman@technion.ac.il

In international comparative terms, the EU has excelled in adopting a set of nature-protection policies and directives. However, these have not been enough to restrain urban and infrastructure development that continues to consume agricultural land and open landscapes. Aware of the urgency caused by climate change, the EU has adopted a set of policies that switches the focus from designating protected areas to restraining the “culprits” –urban areas and commuting zones. EU agencies have also proposed a variety of legal and economic instruments that the different member states are encouraged to adopt and apply.

However, the uniform net-zero policy inevitably meets a variety of existing legal contexts and the realities of property rights. Even though these may seem similar to non-expert eyes, the legal contexts differ in many ways that are likely to impede or support the no net land take policy. Because land-related laws in each jurisdiction are anchored in a complex web of several laws, ongoing regulations, and differing financial and socio-economic contexts, the hoped-for adoption of new instruments is likely to meet more difficulties than expected.

The paper will illustrate the impacts of cross-national differences through one selected topic shared by any planning-law framework: Is there a right to compensation payments or other legal remedies when government bodies seek to roll back previous planning decisions, thereby causing a decline in the value of real property? Are governments legally and financially ready to abolish or divert preexisting development rights? To illustrate the impact that such legal differences can have on the success of the no net land take policy, I will draw on my previous comparative research spanning 14 jurisdictions. The findings showed that no two countries have the same legal response to these questions. The paper will present several cross-national examples where existing laws and property rights can differentially promote or inhibit the implementation of the no net land take policy. These questions point to the need for targeted in-depth comparative research on current and anticipated interaction between differences in laws and regulations across EU countries and how they have already impacted the progress of the no net land take policy, and what are projected expectations.

In many European countries, land-use planning is facing increasing and oftentimes contradictory challenges. The increasing demand for housing is at odds with the policy objective of reducing land take. Densification is often seen as a panacea, yet it entails new implementation challenges, particularly in situations of fragmented property rights. In order to understand how land policy struggles with ever-increasing challenges such as land take, housing shortages, and densification, it is essential to look closely at how land policy is enacted in specific situations, what instruments are used, what actors are involved in the processes, and what the outcomes are.

This contribution shows how in different countries across Europe, land policies are strategically enacted on the local level. It explores the relationship between private landowners and public planning authorities based on 12 specific case studies on land policy in different European countries (AT, BE, CH, CZ, DE, ENG, FI, FR, NL, NO, PL, SE). The cases are a collection of qualitative analysis that introduce how land policy is perceived and pursued in practice in different countries. These stories follow a systematic 5-step approach describing the understanding of land policy, the approach to land, the actors involved, the underlying institutions, and conclude with a reflection of each case within the national context.

The comparative approach provides a structured reflection when facing practical challenges or considering legislative adjustments, empowering them with knowledge and insights. Using the elements land, actors, and institutions to develop a perspective across the cases, we derive a common understanding of land policy and identify how different countries deal with property in land.

The contribution focusses on four main conclusions, which we derive from this comparative research:

- First, the case studies highlight that land policy is often closely related to spatial planning. It differs in two dimensions: (1) Land policy addresses both, allocative and distributive aspects of land property, and (2) it entails a strategic and an operational level of public policy. This allows to differentiate land use policy, land use planning, land tenure policy, and land management from land policy.
- Second, the various cases show how land policies involve a series of intentional decisions or activities led by public actors, sometimes in cooperation with private actors, to address collective issues related to land use and allocation. Therefore, understanding land policies also requires understanding these instruments and how they are strategically combined.
- Third, the comparative insights underscore that differing land policy strategies are rooted in varying interpretations of the role of landowners in land policy. These interpretations are often more decisive than the specific land policy instruments used.
- Forth, the cases reveal a spectrum of how public actors conceptualise the relationship between property rights and land policy. At one end, there is the tendency to overlook landowners as key stakeholders in the planning process –which sometimes leads to almost fatalistic behaviour on the part of planning authorities. At the other end, landowners are seen as partners in the collaborative development of spatial projects. These conclusions illustrate that land use planning and property rights are well-established in individual countries, but there are also viable alternatives. Exploring approaches abroad reveals a deeper understanding of land-use planning, property rights, and spatial development.

Law as a Catalyst for Change in Water Supply Policies in Brazil: The Debate on the National Law for Social Water Tariffs

Authors: Ana Lucia Britto¹; Patricia Finamore Araujo²

¹ *Federal University of Rio de Janeiro*

² *PROURB - UFRJ*

Corresponding Authors: anabrittoster@gmail.com, patricia.araujo@fau.ufrj.br

The rights to water and sanitation were recognized as autonomous, specific human rights “essential to the full enjoyment of life and all other human rights” by the General Assembly of the United Nations (UN) on July 28, 2010, through Resolution A/RES/64/292. This resolution made it clear that providing universal access to drinking water and sanitation is an obligation of governments. In other words, it is the duty of the state to establish public policies to ensure the rights to water and sanitation—implying the removal of both physical and economic barriers that hinder universal access.

Drinking water affordability is among the principles highlighted in the UN resolution. If water services are available but prohibitively expensive, people with insufficient financial means may be forced to rely on cheaper but less safe water sources or practices or to sacrifice other basic rights, such as food, housing, and health. In many countries, social tariffs are a means to ensure affordability and guaranteed access to services for the most vulnerable users.

In Brazil, a new law from June 2024 establishes national guidelines for the Social Tariff for Water and Sewage (the “Social Tariff Law”) that must be adhered to by both public and private service providers. This legislation affirms that basic sanitation must be managed under specific guidelines, including that user payments for services must be reasonable, socially equitable, and affordable.

According to the law Social Water and Sewage Tariff benefits users with a per capita income of up to half (1/2) of the minimum wage, provided they meet one of the following criteria:

- Belong to a low-income family registered in the Single Registry for Social Programs (CadÚnico) or its successor registry system; or
- Belong to a family that includes:

A person with a disability, or

An elderly person aged 65 or older who proves they lack the means to support themselves or receive support from their family and who receives, under Articles 20 and 21 of Law No. 8,742 of December 7, 1993 (the Organic Law of Social Assistance), Continuous Benefit Payment (BPC) or an equivalent successor benefit.

Article 13 of the law established a *vacatio legis* period of 180 days, which ended on December 11, 2024. Between June and December 2024, the law was the subject of intense public debate in various hearings. Some stakeholders in the water sector, including public and private providers and regulators, argued against the law. They claimed it could

lead to the economic unsustainability of water services in many Brazilian municipalities where a significant number of users benefit from social programs, resulting in an unsustainably high number of beneficiaries under the social tariff.

Conversely, social movements advocating for the human right to water supported the law, arguing that by enacting the Social Tariff Law, the Brazilian government fulfills part of the positive obligations inherent in the human rights to water.

This paper aims to explore the public controversies surrounding the national social tariff law for water. It recognizes the law as a fundamental instrument of public policy designed to address the challenges of ensuring universal access to water services in a context of increasing economic uncertainty.

Anticipatory politicization management: the case of No Net Land Take

Author: David Evers¹

Co-author: Federico Savini²

¹ *Netherlands Environmental Assessment Agency*

² *University of Amsterdam*

Corresponding Authors: f.savini@uva.nl, david.evers@pbl.nl

It is now widely accepted that EU-policies, particularly environmental, have considerable impact on spatial planning in the member states (Evers and Tennekes, 2016; Fernández-i-Marín et al., 2024; Purkarthofer, 2024). This impact can be felt at in all phases of the policy cycle: it can frame the discussion on planning issues (agenda setting), affect the types of policy interventions considered, speed up or slow down planning processes and influence physical development (Tennekes and Evers, 2024). As EU-policies become entwined with everyday conflicts over land use in practice, they can become politicized long after being adopted. Consider, for example, how media reports on housing developments frustrated by air or water quality standards or endangered species serve to mobilize Eurosceptic sentiments in domestic politics. Or consider how domestic politicization is prompted by litigation in the context of the enforcement of European policy. The decisions (hence jurisprudence) made by the Court of Justice can blur the distinction between policymaking and the judiciary, at least in the court of public opinion. This can have ramifications for the next wave of European policymaking by politicizing an otherwise technical matter (Feindt, Schwindenhammer and Tosun, 2021).

The case of the No Net Land Take (NNLT) objective, contained in the Soil Monitoring Law legislative proposal is illustrative (European Commission, 2023). By striving to halt all greenfield development by 2050, this goal cuts to the heart of planning practice – but has hardly entered the planning debate in the Netherlands, one of the member states that would be most affected (Evers, 2024). A quantitative analysis of the public consultation clearly shows the extent to which NNLT was depoliticized: there was an overwhelming support for binding legislation on soil quality, and of the need for rules on NNLT in particular (Evers, Soromenho and Savini, 2024). Like the Nature Restoration Act before it, it was mainly during the Parliamentary and Council phases that opposing viewpoints became heard and mobilized. This resulted in the production of a multitude of amendment suggestions, some of which are contradictory and most weakening the

original proposal. At the time of writing, the jury is still out (i.e. the ‘trialogue’ between the three European institutions is still forthcoming).

A form of politicization, however, was achieved within the Netherlands by means of an ongoing interdepartmental assessment instigated to determine the national standpoint in the European Council. This paper argues the Dutch method could be integrated into the European policymaking process to manage or even reduce the politicization of policy after it is too late to change it (Bressanelli, Koop and Reh, 2020; Schimmelfennig, 2020). It reflects on the advantages and disadvantages of escalating an issue politically at a particular moment in the process, and whether there is an ideal moment for this (i.e. early or late politicization). More generally, it contributes to the literature on Territorial Impact Assessment and top-down Europeanization by considering a case study grounded in land-use planning.

The Impact on the Assessment of the Urban Silhouette and Aesthetics of the Socio-Political Context: A Case Study of Istanbul

Author: Azadeh Rezaifar¹

Co-author: Sevgiye Sence Turk²

¹ *Istanbul Arel University*

² *Istanbul Technical University*

ABSTRACT

The ongoing trend since the 1980s is elucidated by scholars across several disciplines using the frameworks of globalization and neoliberalism. The field of urbanization and

planning is no exception to this situation. Like many countries, after the 1980s, Turkey underwent significant socio-political changes that profoundly impacted the country's urban decisions. Structural adjustment with export promotion, control of capital inflows, the elimination of the controls on foreign capital transactions, and integration into the global markets with commodity trade liberalization were the main characteristics of this period. The neoliberal state understanding that began in the 1980s, developed as a result of policies regarding the restructuring of the state in the neoliberal period in the country. During this era, urban land has transformed into a commodity, significantly impacting capital accumulation through exchange value. For the neoliberal state, which seeks perpetual growth in urban regions, project developers and international investors are crucial to realizing this objective. In this context, central administrations appear to have carried out facilitating procedures to solve legal problems that may arise against project creators. In the context of facilitation, changes in existing laws, plans and/or new legal regulations, plans and institutional structures are put into effect. Large-scale investments resulting from these regulations have started to affect the urban silhouette and aesthetics. In Turkey, the government's economic policies are mainly focussed on tourism, housing and related construction sectors. The impact of tourism, housing and construction policies has had the effect of transforming urban spaces, but in this transformation, Istanbul's historical and natural environmental features and urban aesthetics have been mostly ignored. It has created uncertainties in the evaluation of urban silhouette and aesthetics.

This paper analyses the impact of the socio-political context on the evaluation of urban silhouette and aesthetics through three different examples in Istanbul. These three examples reflect different periods of neoliberal policy implementation. These examples are; 'Süzer Plaza', 'Park Hotel', and '9/16 Towers'. As is well documented, all three projects have been the subject of extensive debate in terms of their location in a protected historical environment and their direct impact on the urban skyline and aesthetics. The primary focus of the discourse surrounding these illustrations is the discord between modern and traditional urban design and vertical urbanisation, in terms of urban silhouette and aesthetics. In this study, the impact of these investments and structures on the urban silhouette and aesthetics, as well as the debates and legal actions that accompanied them, will be examined for each example based on the sociopolitical context of the time. The aim of the study is to consider the spatial area circumstances of these significant constructions, the legal dimension, the socio-political dynamics of the time, and the conversations that occurred.

The study's findings demonstrate that the socio-political context exerts a significant influence on the configuration and aesthetic principles employed in the processes under examination. This influence manifests differently, resulting in divergent resolutions for comparable issues in the context of urban law. This observation suggests that context influences the process in a circumstantial way.

The Rule of law in the planning system -a view on the Global South

Author: Mohammad Reza Tavangar¹

¹ *University College Dublin*

Corresponding Author: reza.tavangar@dkit.ie

Planning systems can be described as an amalgamation of legal structures, power relations, governance dynamics, and undoubtedly, a network of various actors affecting the form and function of the built environment. Planning systems are the main instrument

with which governments control and manage development. For many planning practitioners and theorists in the Global North, considering planning systems as legal structures often suggests that a well-defined framework with foreseeable outcomes guides the governance of urban development. However, many studies and considerable evidence from practice show that in many countries of the Global South, the legal structure of planning systems demonstrates entirely different mechanisms –often leading to unanticipated outcomes. As understanding the intricacies of power relations in planning systems of the Global South is becoming an enigma for planning theorists and practitioners, significant efforts have been made to conceptualise these contexts by “seeing from the South”(see e.g. Wattson, 2009; Roy, 2005). Describing such planning environments as conflicting rationalities is merely one perspective towards Southern, top-down, informality-dominated, uncertain, and poorly governed planning systems.

In line with current enquiries on Southern planning systems, this paper focuses on one of their substantial aspects, which outlines a factual legal landscape of such planning systems: the rule of law. The rule of law provides a contextually realistic picture of the extent to which the planning system is managed by laws and regulations, in addition to providing theorists and practitioners with an a priori perception of the planning legal setting. In this respect, this article investigates the Iranian planning system by highlighting examples from real-world projects and planning events to present its particularities and illustrate how different degrees of rule of law (RoL) affect the power dynamics and consequently the outcomes of planning processes. To evaluate the Iranian planning system in terms of RoL, a thin definition (Rodriguez, 2010) of RoL has been employed to avoid value judgments and generalizations of Northern institutional and fundamental values, which are often equated to universal definitions of substantial RoL (Versteeg & Ginsburg, 2017). The findings of the research suggest that most planning systems in the global South are greatly defined by weak rule of law, and therefore, non-legal authority, and other informal types of power, are the main avenues of practicing power for those involved in the planning process. This study contributes to the growing body of literature on the Global South and offers valuable insights for policymakers, planners, and researchers interested in promoting equitable and sustainable development in these regions. The paper concludes with recommendations for adapting the planning system to the weak rule of law in the South.

This study investigates the interplay between walking, urban vitality, and the distinction between static (residential) and dynamic (activity-based) exposures in urban environments. Using GPS tracking data from participants in Palma de Mallorca, we examine the vitality of spaces encountered during walking trips compared to residential environments. The findings reveal that walking predominantly occurs in moderately vital areas, avoiding extremes and offering a consistent and equitable urban experience. This aligns with Jacobs' concept of the "sidewalk ballet," where pedestrian activity sustains and reflects urban vitality.

Dynamic exposure emerges as a nuanced framework that transcends the limitations of static residential analyses, highlighting the fluid and context-dependent nature of urban interactions. Key results demonstrate the decoupling of residential characteristics from walking environments, with walking acting as a social equalizer, bridging disparities in urban vitality across neighborhoods. Accessibility is identified as a critical factor, with high-accessibility areas providing slightly higher vitality levels and more consistent pedestrian experiences. However, the analysis also reveals gaps in functional diversity and building variety along walking routes, underscoring the need for targeted interventions to enhance pedestrian-friendly spaces.

This study contributes to urban planning by emphasizing the role of walking in mitigating spatial inequalities and fostering inclusivity. It advocates for distributing vibrant, walkable spaces throughout cities to ensure equitable access for all populations, while addressing systemic barriers that limit exposure to highly vibrant areas. By integrating dynamic exposure into urban analyses, planners can develop more sustainable and engaging environments that prioritize pedestrian mobility and connectivity. These findings highlight the transformative potential of walking as a cornerstone of equitable urban design and sustainable mobility in contemporary cities.

Positive and Normative dimensions of accessibility by proximity for supporting a fair and sustainable 15 min city model

Author: Paola Pucci¹

Co-author: Giovanni Lanza ¹

¹ *Politecnico di Milano*

Corresponding Authors: giovanni.lanza@polimi.it, paola.pucci@polimi.it

The presentation introduces several dimensions of the concept of accessibility by proximity that may better frame the actual contribution of proximity in different planning experiences finalised to promote the Xmin city model. Challenging an acritical use of the proximity concept based on the physical spatial-temporal conditions and a focus mainly on dense compact urban contexts, the presentation proposes to enrich this concept by combining a functional dimension of proximity, with a relational one, focused on the exchange of resources and collaboration spontaneously activated in a community, sharing specific accessibility-related needs, problems and mobility opportunities.

Based on this, the presentation aims at

- Introducing some considerations on the relationship between the Xmin city model and the accessibility by proximity concept and its relevance for a potential paradigm shift for reorienting transportation and land use planning toward increasing the availability of services, activities, and social contacts in proximity to reduce the need for travel, towards less extensive but more active and sustainable forms, and helping to reinforce internal community ties (Ferreira et al. 2003, 2007).
- Proposing a declination of proximity (as a mean) and accessibility by proximity (as an end) that can contribute to deal with the challenging issues in the implementation of X min city. Among them: the risk of standardising people's needs and underestimating the demands of different social groups, reproducing existing inequalities (Cooke et al. 2022); and limited replicability in several different socio-spatial as in suburban, peri-urban and rural areas (Guzman et al., 2021); an increase in housing prices, gentrification and displacement of vulnerable populations (Dunning et al. 2021; Haarstad et al., 2022; Poorthuis & Zook, 2023) exacerbating social divides (Guironnet and Halbert, 2020).
- Presenting an operative framework for dealing with new metrics of accessibility by proximity and its positive and normative dimensions, based on the results of two research projects (<https://ex-tra-project.eu/>; <https://commonaccessproje>).

Interpretable Spatial Machine Learning Insights into the Impact of Built Environment on Intercity Commuting

Authors: Xinyu Lin¹; Yandong Zhu¹; Ling Jiang²; Shumin Wang¹

¹ School of Architecture, Southeast University

² Southeast University Architectural Design & Research Institute Co.

Corresponding Authors: 220230067@seu.edu.cn, 13951674666@163.com, 220230257@seu.edu.cn, 15261883668@163.com

With the enhancement of intercity travel convenience and the effective sharing of urban public resources, commuting patterns have evolved beyond single-city boundaries, increasingly reflecting inter-regional mobility. Compared to intra-city commuting, intercity commuting is characterized by a larger spatiotemporal scope, longer commuting durations, and a greater reliance on transportation infrastructure. Consequently, the choice of intercity commuting is influenced not only by the physical distance between home and workplace and housing costs, but also by factors such as the level of economic development, the availability of public services, and the configuration of intercity transportation networks. Recent research has indicated that the built environment exerts a non-linear and spatially heterogeneous effect on intercity commuting distribution, revealing the complex interactions between these factors (Li and Niu, 2022). However, few studies have managed to address both two characteristics simultaneously.

The study focuses on Nanjing and Ma'anshan as case studies, two cities with a high degree of urban integration in China. The area is divided into 1,756 traffic analysis zones, with data from one month of cellphone signaling analyzed. Preliminary results reveal that, there is an uneven distribution of intercity commuting flows, with north-south commuting significantly surpassing east-west commuting in volume and a pronounced 'center-to-center' spatial distribution pattern. To further explore the impact of the built environment on intercity commuting, the study employs an interpretable spatial machine learning framework that combines the Geographically Weighted Random Forest (GWRF) model with SHapley Additive exPlanations (SHAP) analysis, uncovering the complex spatial factors influencing intercity commuting patterns.

The GWRF model effectively combines the spatial analysis capabilities of Geographically Weighted Regression (GWR) model with the predictive power of Random Forest (RF) model to better reveal the potential spatial heterogeneity and nonlinear effects of the variables, while SHAP enhances interpretability (Wu, Zhang and Xiang, 2024). Preliminary results show that employment density and public transportation coverage are the primary factors influencing the attractiveness of intercity commuting (with importance values of 16.34% and 14.47%, respectively). The workplaces of intercity commuters typically exhibit spatial agglomeration characteristics, with commuting attractiveness increasing sharply when employment density exceeds 4,500 jobs/km², demonstrating the nonlinear positive effect of employment density on commuting. Furthermore, since intercity commuters typically face longer travel distance, their demand for convenient transit transfers is higher (Bouzouina et al., 2021). However, the study also finds that the attractiveness of commuting plateaus when transit route density exceeds 106 routes/km², indicating a saturation effect of transit coverage and accessibility on intercity commuting. From the commuting generation perspective, land prices and educational resources emerge as the two critical influencing factors (with importance values of 19.56% and 13.62%, respectively). This suggests that when housing prices in large cities exceed the affordability threshold for intercity commuters, they tend to choose residence in neighboring cities, aligning with findings from previous studies (Chen, Ge and Pan, 2021). The strong positive relationship between educational resources and intercity commuting is attributed to the abundance of educational resources in Nanjing and proximity-based enrollment policies that attract residents from nearby cities.

Based on the above findings, the study proposes differentiated optimization strategies to enhance urban morphology and transportation layout, thereby improving intercity commuting efficiency. The results provide a theoretical foundation for optimizing urban design and transportation networks, as well as practical guidance for urban planning and transportation policy, particularly in the context of promoting the integration of urban agglomerations and metropolitan areas, offering significant practical value.

T_03 MOBILITY (A) / 749**Impact of Multi-Station Aggregate Hub Redevelopment on Surrounding Urban Areas: A Case Study of London's King's Cross****Authors:** Yufei Qu¹; Yuying Zhu¹; Xiaoxi Zhang¹; Chuan Wang¹¹ *Southeast University***Corresponding Authors:** mimozzzzzzz@163.com, 2596781507@qq.com, chuanwang@seu.edu.cn, 2757140597@qq.com

In the past decades, the condensation of urban networks of metro and rail lines is re-shaping the spatial configuration of cities and transforming travel patterns, thereby influencing urban development patterns and intensities. (Desjardins et al., 2014) With continuous urban growth, the densification of metro and rail networks have given rise to multi-station aggregate hubs formed by interrelated stations. These hubs, emerging as creative industry and high-quality life cores, profoundly affect the development of their surrounding urban areas. (Cao, 2022) However, existing research on the integration of transport stations and surrounding land use has primarily focused on one single station (TOD). As metro and rail lines become increasingly interconnected, multi-station aggregation has become a new trend in large metropolises, often occupying core urban areas or serving as critical urban transport hubs. (Kidokoro, 2020) Despite this, there is a notable lack of systematic research on multi-station hubs and their closely associated urban functional districts.

This study focuses on the case study of King's Cross, London. The studied area is delimited into core, primary impact, and potential impact zones to analyze the relationship between transport, functionality, and spatial renewal using spatiotemporal geographic data. The historical data used are from the years 2007, 2011, 2015, 2019, and 2023, following the substantial completion of King's Cross Station. The study explores the mechanisms through which the redevelopment of multi-station aggregate hubs influences surrounding urban development. First, the spatial evolution in the past two decades is traced, outlining the renewal processes of surrounding districts based on the development trajectory of the King's Cross–St Pancras multi-station aggregate hub. Second, changes in transport networks, functional vitality, and development intensity are quantitatively analyzed and visually represented in GIS, revealing the driving effects of multi-station transport redevelopment on the surrounding area. Finally, redevelopment modes within the study area are classified and summarized in terms of forms of reconstruction and spatial layouts.

The findings indicate that most developments in the King's Cross area are concentrated within the core zone and its adjacent area. The intensity of development momentum and the driving force for spatial expansion are positively correlated with the distance to the multi-station aggregate hub. The ratio of renewal building areas in the three zones of King's Cross—core, primary impact, and potential impact zones—has reached 30:3:1. Moreover, the aggregation of transport hubs creates efficient connectivity, stimulates functional demand, as evidenced by the significant growth of consumer and service-oriented Points of Interest (POIs) in the surrounding area. From the perspective of spatial development, the emergence of new economic and employment forms has transformed transport aggregation zones into mixed-use areas that attract creative industries. Over two decades of development, this has driven the continuous utilization of opportunity sites in surrounding areas.

This study examines the influence of multi-station aggregated hub's redevelopment on its surrounding areas and summarizes urban development modes. (Ibraeva et al., 2020) It provides insights for the planning and redevelopment of multi-station urban districts in future megacities, shedding light on the spatial transformations brought about by the integration of urban and transport networks, offering valuable guidance for similar projects worldwide.

ENHANCING URBAN SEA TRANSPORTATION THROUGH WALKABILITY AND MICROMOBILITY INTEGRATION WITH FERRY TERMINALS

Authors: ceyhun ilsever¹; kevser ismet üstündağ²

¹ *istanbul okan üniversitesi*

² *mimar sinan fine arts university*

Corresponding Authors: kevser.ustundag@msgsu.edu.tr, ceyhun.ilsever@okan.edu.tr

Istanbul, a city where sea transportation has historically played a significant role, currently faces a decline in the share of this mode in the overall public transport system to less than 3%. This decrease, despite the city's geographic advantages, is attributed to multifaceted factors such as the integration of sea transportation, accessibility challenges, and user habits. On the other hand, efforts to promote sustainable urban mobility increasingly focus on walkability and micromobility applications.

The primary objective of this study is to develop proposals for walkability and micromobility enhancements around ferry terminals by addressing user-friendly, sustainable, and environmentally low-impact transportation modes in an integrated manner. The proposed model aims to contribute to resolving urbanization-driven global crises by supporting physically accessible, socially and economically equitable, and environmentally friendly transportation systems.

Within the scope of this study, ferry terminals in Istanbul will be categorized based on usage intensity, and one terminal from each category will be selected. A 400-meter radius around each selected terminal (approximately a 5-minute walking distance) will be defined as the study area. These areas will be analyzed in terms of the level of public open spaces, mobility intensity, land use diversity, and the variety of transportation modes.

In the next phase, the current quality of walking infrastructure and micromobility facilities in the selected areas will be evaluated in detail. Improvement proposals will be developed based on literature-driven criteria to encourage pedestrian mobility. To strengthen micromobility, innovative approaches will be proposed concerning road and safety infrastructure, vehicle parking areas, rental points, and the integration of ferry terminals with micromobility.

The findings of this study aim to support the integrated planning of sea transportation with pedestrian mobility and micromobility, facilitating the transition to human-centered and environmentally friendly transportation systems. In this context, the proposed model has the potential to increase walking activity and the use of lightweight vehicles such as bicycles and scooters, while encouraging residents to prefer sea routes as part of their daily travel.

Understanding Mobility and Activity in the Low Traffic Neighbourhood: The Case of East Oxford, UK.

Author: Tim Jones¹

Co-author: Nurgül Yardım Meriçliler ¹

¹ *Oxford Brookes University*

Corresponding Authors: nyardim-mericdiler@brookes.ac.uk, tjones@brookes.ac.uk

The Low Traffic Neighbourhood (LTN) is a recent traffic management approach to removing motorised through-traffic from residential streets in the UK by strategically blocking roads using bollards and planters while allowing passage of walkers and cyclists and other micromobilities including electric scooters. Automatic Number Plate Recognition (ANPR) cameras are also used to facilitate the passage of emergency service vehicles and public service vehicles.

Critics of LTNs argue that such schemes force traffic onto boundary roads of LTN resulting in congestion and associated traffic pollution increasing along those routes and question their impact on equitable sustainable mobility. Supporters of LTN highlight the wider benefits to the community including improved road safety and environmental quality through less motor traffic and the potential to encourage more people to walk and cycle for short journeys; increased opportunity for social interaction among neighbours; and the ability of children to play out in the street. Because of their recent implementation in the UK, studies on the impact of LTN are nascent (Aldred et al., 2024; Aldred et al., 2021; Pritchett et al., 2024; Xiao, 2023).

The focus of this paper is the city of Oxford which became the site of resistance to LTN culminating in a national protest in the central area of the city in February 2023 (Quinn, 2023). The paper provides an insight into residents' perceptions of the impact of LTN gathered through a social survey of householders at dwellings (approx.5000) within and along the boundary of the most recent 'East Oxford LTN'. This was supplemented with static and mobile interviews (Büscher et al., 2010; Fincham et al.2010) with respondents during summer 2024.

The results of our survey (n=528) show that the East Oxford LTN has made a positive impact across most indicators (e.g. walking and cycling; social interaction; children's play) but that support for the LTN was more likely among households: located within the LTN (as opposed to along boundary roads); with children; with access to cycles; and, without access to a car. Interviews (n=30) and mobile interviews (n=15) with purposively selected householders from the survey reveal the complexity of opinion on the impact of the East Oxford LTN and nuance even within groups 'pro' and 'anti' LTN. Based on these

findings, and in considering the contributions and limitations of LTN in equitable and sustainable mobility (Dudley et al., 2022) we provide lessons for policy within the context of wider interventions to support the transition to sustainable travel and liveable neighbourhoods.

Beyond the ride: A bike along study on infrastructural factors and determinants influencing the docked bike-sharing experience

Author: Oriol Roig Costa¹

Co-author: Oriol Marquet Sardà¹

¹ *Universitat Autònoma de Barcelona*

Corresponding Authors: oriol.marquet@uab.cat, oriol.roig@uab.cat

Context: Cycling for transportation is increasingly recognised as a core strategy to combat the climate emergency, particularly in urban environments. Over the past few years, bike-sharing services have evolved from novel experiments to integral components of urban transportation networks, offering a flexible and valuable opportunity to attract new users to cycling and promote sustainable mobility as an alternative to traditional modes of transport (Eren & Uz, 2020; Shaheen et al., 2020; Teixeira et al., 2020). These systems, which differ from private bicycles in their shared use, have reshaped the urban landscape by providing a convenient, low-cost transportation option. Their unique dynamics of access, community use, strategic locations, coverage

areas, and technological integration present distinct experiences and challenges that clearly differentiate them from private bicycle use, while maintaining the physical form of bicycles (S. Ji et al., 2024). However, the rapid growth in the use of these schemes has exposed critical gaps, such as insufficient cycling infrastructure, system saturation, or poor integration with other transport modes, which continue to hinder their full potential.

Purpose/Methods: By using a mobile methodology, we interviewed 17 docked bike-sharing users in Barcelona to obtain in-depth and context-sensitive information about the environmental factors influencing their perceptions and experiences (Van Cauwenberg et al., 2018). Researchers and participants embarked on a videorecorded cycle trip, during which bike-along interviews were conducted to explore how infrastructure and spatial dimensions shaped riders' experiences. The data was analysed using a dual approach: an inductive content analysis combining thematic analysis of participants' narratives and video-based observations of their embodied interactions with the urban environment. This comprehensive methodology led to the development of a model encompassing eight key environmental themes, capturing both the subjective experiences of riders and the spatial dynamics shaping their trips.

Results: Our findings reveal that traffic safety - modulated by cycling infrastructure and network connectivity- strongly influences how users of shared bicycles perceive urban spaces. Consistent with previous studies participants in our study exhibited a preference for designated and wide cycling space, ideally separated from motorised traffic, particularly on narrow streets with heavy and speeding traffic. Furthermore, participants reported that features specific to shared bicycles, such as their design and maintenance, notably shaped their riding experience. Beyond the act of cycling itself, our analysis also highlights the importance of often-overlooked stages, such as the bike pick-up and return processes. These moments present spatial and accessibility challenges that could limit the consolidation and expansion of bike-sharing schemes. While larger station capacities are generally associated with improved service access, our findings highlight significant supply shortages during peak demand at high-capacity stations, particularly near major mobility hubs. However, the significance of docked stations in the overall bike-sharing experience extends beyond station capacity and turnover ratios. In particular, the design of the stations emerged as another critical dimension influencing user satisfaction and safety perceptions. Participants expressed concerns about stations located in close proximity to motorised traffic, which were perceived as unsafe; and stations on sidewalks, which were viewed as inconvenient for pedestrians.

Conclusions: This study contributes to ongoing discussions around rethinking urban transport systems to prioritise equity, accessibility, and sustainability. Our findings reveal that subjective safety perceptions, influenced by infrastructure and bicycle design, are as important as objective safety outcomes. Policies should prioritise improving safety on routes identified by bike-sharing users as unsafe, focusing on consistent cycling paths, dedicated infrastructures, and addressing complex traffic challenges. Features like poor signage and confusing.

T_03 MOBILITY (A) / 1270**Can proximity forge strong bonds? Exploring the relationship between urban proximity and social cohesion at the neighbourhood level****Author:** Serena Mombelli¹**Co-authors:** Carme Miralles-Guasch ¹; Oriol Marquet ¹¹ *Universitat Autònoma de Barcelona***Corresponding Authors:** oriol.marquet@uab.cat, serena.mombelli@uab.cat, carme.miralles@uab.cat

In recent years, urban proximity has received renewed attention in urban and transport planning as cities strive to create environments that promote sustainability, health and overall quality of life. While the environmental and health benefits of proximal urban environments are well documented - such as reduced carbon emissions, improved air quality and increased physical activity - the social implications, particularly in terms of social cohesion, remain under-researched. Social cohesion, which refers to the strength of social ties, shared values and a sense of belonging within communities, has been linked to a range of benefits, including increased community resilience, improved public health and greater collective well-being. However, despite its importance, there is still limited understanding of how proximity to everyday destinations shapes social cohesion.

Previous research has examined how different characteristics of the built environment - such as density, diversity, design and walkability - affect social cohesion. These factors have been shown to influence how people interact with their surroundings and with each other. However, few studies have specifically isolated the impact of proximity to key destinations - such as grocery stores, parks, schools and health facilities - on social cohesion. This gap is particularly important given that proximity can influence the frequency and quality of social interactions, as well as the overall accessibility of services that support daily needs.

In this research, we aim to address this gap by integrating both objective and subjective measures of proximity to destinations to assess their influence on community cohesion. Our study uses survey data on social cohesion and perceptions of proximity, together with geo-referenced data on actual distances to everyday destinations in five Spanish cities: Madrid, Barcelona, Valencia, Palma de Mallorca and Granada. Using partial least squares structural equation modelling (PLS-SEM), we analyse the relationship between proximity and social cohesion, focusing on how perceptions of proximity mediate this relationship, while controlling for socio-demographic variables such as age, income and education.

The results show a significant negative relationship between distance to everyday destinations and social cohesion, mediated by perceptions of proximity. This suggests that social cohesion is influenced not only by the physical proximity of destinations, but also by how individuals perceive this proximity. The negative effect is particularly pronounced when there is a mismatch between actual and perceived proximity - when destinations are perceived to be closer or further than they actually are. Furthermore, distance to everyday destinations was found to have a significant impact on two critical sub-dimensions of social cohesion: need satisfaction (the extent to which basic and social needs are met within a community) and group membership (the sense of attachment and belonging to a community). The study also highlights the role of socio-demographic factors, with older residents and those living in neighbourhoods with fewer rented homes reporting higher levels of social cohesion, possibly due to greater reliance on local networks and services. These findings highlight the complexity of the relationship between proximity, perceptions and social cohesion, and the need for equitable urban planning strategies.

The implications of this research are clear: urban planners and policy makers should prioritise equitable access to essential services and consider both objective and subjective dimensions of proximity in their designs. By fostering environments where everyday destinations are accessible and perceived as close, cities can strengthen social cohesion, build community resilience and promote a higher quality of life for all residents. This integrated approach is crucial to creating more inclusive and socially sustainable urban environments.

With the intensification of global climate change and energy crises, green and low-carbon development has become a core objective of urban planning. As a critical component of urban green transportation systems, slow traffic networks can not only reduce carbon emissions but also enhance residents' quality of life and travel experience.

The spatial structure of all landscapes is composed of three fundamental elements: patches, corridors, and matrices, known as the "Patch-Corridor-Matrix" model. Ecological networks use various corridors to organically connect landscape patches, forming a continuous spatial structure that emphasizes the structural and functional relationships between patches, corridors, and matrices. Similarly, an urban slow traffic network organizes public space resources through slow traffic pathways and integrates public service facilities into a network system of areas, lines, and nodes, demonstrating a comparable spatial organizational logic to ecological networks.

Currently, urban slow traffic networks face issues such as lack of systematic organization, poor continuity, insufficient consideration of ecological values, and single functionality, etc. This study takes the central urban area of Shanghai as the research object. Inspired by the network model and construction methods of landscape ecology, it selects multidimensional resistance indicators for slow traffic. By calculating the optimal experiential slow traffic corridors, the study constructs a systematic urban slow traffic network from the perspectives of areas, lines, and nodes, ensuring traffic efficiency while addressing the issue of single functionality.

(1) Areas: Identification of Slow Traffic Patches

Using Morphological Spatial Pattern Analysis (MSPA), the study scientifically identifies and classifies natural resources (e.g., green parks, water bodies) and cultural resources (e.g., commercial centers, cultural heritage sites, public spaces). Key patches, such as core areas and edge zones, are extracted to provide foundational nodes for the slow traffic network.

(2) Lines: Construction of Slow Traffic Corridors

Located on the East China Plain, Shanghai's natural resistance to walking and cycling is relatively low, making the built environment the primary influence on slow traffic resistance. Based on domestic and international studies on walkability, this research selects slow traffic indicators from five dimensions: greenery, health, vitality, equity, and safety. A slow traffic resistance index is developed, with indicator weights determined using the entropy method.

The Minimum Cumulative Resistance (MCR) model is employed to construct a resistance surface for Shanghai's slow traffic network, identifying corridors with the lowest cumulative resistance. These corridors represent streets with potential for ecological prioritization, spatial comfort, vitality, accessibility, and safety.

(3) Nodes: Design of Slow Traffic Stepping Stones

Inspired by commonly used landscape ecology indices, including the alpha index (network closure index), beta index (node connectivity), and gamma index (network connectivity), this study calculates the cyclic and connective relationships between nodes and corridors based on spatial topology. Slow traffic stepping stones are designed in areas with low network connectivity.

In ecology, stepping stones serve as intermediate stations for species migration. Similarly, slow traffic stepping stones are designed as small public spaces or service facilities that provide rest areas and enhance connectivity between large patches. This increases activity frequency for residents traveling between slow traffic patches.

This study innovatively incorporates ecological theory into the construction of urban slow traffic systems. By integrating natural and cultural patches with scientifically designed corridors, it addresses the lack of systematic planning in current slow traffic corridor development. Furthermore, it expands the scope of slow traffic systems from a single transportation function to include multiple dimensions such as ecological services, cultural exchange, equity, and inclusivity, etc. The research provides both practical examples and theoretical support for urban green and low-carbon development, offering a reference model for the planning of slow traffic systems in other cities.

"Beyond Growth" in China: Coordinated Optimization Strategies for Rail Transit Networks and Regional Spatial Structure in the Post-Urbanization Context

Author: Yuxiao Ma¹

Co-authors: Jianzhong Huang¹; Qiao Zhang²; Jing Deng³

¹ *Tongji University*

² *Shanghai Tongji Urban Planning and Design Research Institute Co., Ltd*

³ *(Shanghai Tongji Urban Planning and Design Research Institute Co., Ltd*

Corresponding Authors: 892115476@qq.com, hjz03213@vip.126.com, dengjing9487@126.com, zqiao@126.com

In recent years, terms such as "stock-oriented development" (存量发展, development based on existing assets) and "high-quality development" (高质量发展, development emphasizing sustainability, equity, and efficiency) have become increasingly prevalent in government documents and scholarly papers on urban planning in China. After four decades of rapid urbanization involving an unprecedented scale of population migration (approximately 770 million people), major cities and developed regions in China have begun to exhibit characteristics of entering a post-urbanization phase, particularly in terms of population growth, economic restructuring and spatial expansion. This specific context, while sharing certain commonalities with the experiences of other countries, also presents unique characteristics rooted in China's rapid urbanization process. As a result, in China, the strategic framework of "beyond growth" has been adapted and enriched, and is more commonly referred to as "high-quality development." Within this framework, public transportation, as a quasi-public good, is regarded as a critical system supporting high-quality development. In particular, rail transit systems have proven effective in alleviating some of the challenges faced by major cities by facilitating the flow of production factors and providing mobility opportunities. Moreover, analyses indicate that optimizing rail transit systems in China's major cities is an urgent priority at the current stage, given their role in addressing urban challenges and supporting sustainable development.

Through comparative case studies based on multi-source data and China's planning practices, this study addresses three key questions: (1) What are the contextual roots of 'beyond growth' in China? How has its reinterpretation shaped distinct strategic priorities or implementation strategies compared to other countries? (2) What challenges and requirements does high-quality development create for rail transit systems? (3) What is an effective strategic framework for the coordinated optimization of rail transit systems and regional spatial structures to alleviate challenges in major cities?

The analysis reveals that these differences stem from several factors. China's policy-driven urbanization has been faster, larger in scale, and more spatially extensive than in other countries. Additionally, the dominance of automobile-oriented motorization during urbanization has exacerbated transportation-related challenges. The explanatory framework highlights that policy-driven rapid urbanization has resulted in significant regional imbalances. These imbalances concentrate on economic opportunities in major cities, sustaining population migration even as these cities enter the post-urbanization phase. Moreover, despite resource shortages and social tensions, major cities remain

integral to national strategies such as city-cluster development and infrastructure inter-connectivity. Automobile-oriented motorization has shaped urban expansion, while rail transit development has lagged behind, exacerbating spatial and mobility challenges in the post-urbanization phase. As a result, the “beyond growth” framework in China must address not only the dilemmas of growth dependency and the pursuit of equity and sustainability but also the legacy issues of rapid urbanization. In this context, government-led planning remains crucial, but greater grassroots participation is needed for balanced development.

Based on the analysis, this study identifies several challenges facing rail transit systems in China’s major cities, including limited space for new rail corridors, diminishing marginal benefits of new projects, and complex governance structures declining marginal benefits of new rail transit projects. Drawing on planning practices and addressing the “development dilemma under growth constraints,” the study proposes a strategic framework for the coordinated optimization of rail transit systems and regional spatial structures, with goals such as regional integration, urban spatial structure optimization, rail network improvement, and meeting resident mobility needs. This framework focuses on optimizing regional rail corridors and nodes, structural rail networks in metropolitan areas, and intensive metro networks within cities. It also clarifies the mechanisms for cross-administrative collaboration and operational support for rail transit networks at different levels.

The role of New Working Spaces in the context of the 15-minute city: insights from Greek case studies

Author: Dimitra Plastara¹

Co-author: Georgia Pozoukidou²

¹ *PhD Candidate*

² *Department of Spatial Planning and Development, Aristotle University of Thessaloniki*

Corresponding Authors: gpozoukid@plandevel.auth.gr, dgplastar@plandevel.auth.gr

Urban areas face challenges like climate change and socioeconomic crises, necessitating innovative planning. Their inability to manage global shocks locally underscores long-term structural, organizational, and governance vulnerabilities (Pozoukidou & Plastara, 2025). At this edge, the 15-minute City (15mC) concept emerged as an innovative neighborhood-based approach for sustainable urban development. This idea is based on key urban planning principles like equitable access to services, mixed land uses, reducing commuting, increasing green spaces, and prioritizing the neighborhood as the community core (Pozoukidou & Chatziyiannaki, 2021; UN-Habitat, 2018). The 15mC approach suggests mixed land use and a compact urban form providing residents the daily needs within a short walk, bike ride, or transit stop (Moreno et al., 2021; Pozoukidou & Chatziyiannaki, 2021). This model aims to increase accessibility through geographic or digital proximity (Pozoukidou & Plastara, 2025). Proximity constitutes one of several ways for people to access spatially distributed opportunities in the urban environment. While the 15mC suggests proximity to daily needs as a solution to avoid commutes, the inflexible daily commuting to work remains an issue (Elldér, 2022; Pozoukidou and Chatziyiannaki, 2021).

In the post-COVID era, remote working has increased significantly, with 22.2% of people in the EU sometimes working from home in 2023 (Eurostat, 2024). The growing technological development combined with knowledge-intensive activities have transformed the nature of work, allowing individuals to work from anywhere. New forms of physical and virtual working locations outside of the “traditional” workspace have emerged as spatialities of RW. Building on Yu et al. (2019), there are six types of spatialities, defined by the location and nature of the working environment as New Working Spaces (NWS), these spaces allow “near working”–working closer to home (Biagetti et al., 2024). NWS such as coworking spaces (CS), third places like cafes and libraries, or neighborhood-based working hubs provide equipped and flexible spaces and can also serve additional i.e. cultural purposes (Di Marino, 2018). NWS can be a solution for individuals who are engaged in hybrid working arrangements, many of whom prefer using third places near their houses, reducing the need for long daily commuting to a traditional office (Biagetti et al., 2024). NWS can tackle the social isolation associated with work-from-home, fostering social interaction and community engagement. Locating workplaces within neighborhoods supports sustainable living and working, reduces daily commutes, and minimizes the associated environmental impact.

This paper examines whether NWS have the potential to serve as nuclei for the reorganization of the neighborhood in the 15mC framework, as they could be a solution for reducing the daily and inflexible commute to the traditional workplace. Two case studies were selected for comparative analysis, Athens and Thessaloniki, the capital and the second largest city in Greece respectively. In addition, for this analysis, only formal CSs were used from the variety of NWS.

Methodologically, spatial analysis will be conducted in GIS and open data from OSM will be used regarding the location of CS as well as the complementary land uses in a 15-minute range calculated in walking distance. The network analysis will be calculated by following the pedestrian network of each city instead of Euclidean distance from CS points.

The comparative results for the two cities are expected to i) Show the allocation of CS in the two cities and the service area that is covered by at least one CS and ii) The influence of CS on diverse amenities and services around them within the 15-minute range. The study contributes to the ongoing planning debate on emerging urban models for sustainable neighborhoods, drawing on insights from the European South.

Daily Mobility and Public Open Space in Large-scale Housing Estates: Connection and Social Networking Quality in a 15-minute City Concept

Authors: Uģis Bratuškins¹; Alisa Korolova¹; Sandra Treija¹

¹ *Riga Technical University*

Corresponding Authors: alisa.korolova@rtu.lv, ugis.bratuskins@rtu.lv, sandra.treija@rtu.lv

In the second half of the 20th century with the expansion of motorised transport “traffic function” of the streets started to dominate over the “place function”. The up-to-date urban mobility faces critical problems that require fast, innovative and effective solutions. One of the most visible problems is traffic congestion, which reduces traffic efficiency, increases pollution levels and affects the quality of life in cities (Herrera-Acevedo, Sierra-Porta, 2025), raising concerns about the rapid expansion of climate change. The second is the conversion of the outdoor spaces of the residential environment into car parking spaces, reducing the areas for relaxation, active recreation and other activities aimed at the population’s well-being. This, in turn, increases the risks of social isolation and marginalisation. These negative phenomena encourage cities around the world to seek innovative solutions that support the spatial and social sustainability of urban environments (Nello-Deakin, 2024).

The 15-minute city concept emphasises proximity and diversity as key living options in urban planning based on walking and cycling. It is becoming a widely accepted strategy among urban planners around the world who aim to create a more walkable, car-free environment and a shift to more sustainable travel habits (Moreno, C., Allam, Z., Chabaud, D., et.al., 2021; Tammaru, et.al, 2023; Iannacci, et.al., 2025). The idea of a micro-district as the basis of the urban structure has been implemented in many European cities, where they form large built-up areas with the majority of the city population living there (Dragutinovič, et.al, 2023; Galan, 2024). These districts are initially planned in such a way that residents are provided with everything they need for everyday life within easy walking distance. Considering the specific urban pattern of the modern LHE’s environment, our research project 15minESTATES is focused on relations between the ‘15-minute city’ concept and the modernist city concept implemented in LHEs. Through selected case studies in five European cities, the aim is to scrutinise if the six essential urban social functions of a ‘15-minute city’ are present in the urban patterns in LHEs, and whether the amount and proximity to these specific services would help in saving time wasted in traffic, thus promoting sustainable mobility. Qualitative and quantitative methods will be adopted for the case studies, including mapping, spatial analysis, surveys, and interviews.

Comprehensive understanding of community interests and needs is crucial on the way to transitioning into sustainability. Thus, in this paper we present a complex approach for community engagement for investigating inhabitants’ mobility behaviour and disclose which functions are connected to the car-dependent behaviour of residents in the selected case studies. Comparison of the several public participation methods used during the workshop sessions in Riga and Delft allowed to close the gap in the collected information, and ensure better understanding of inhabitants’ opinions, attitudes and needs. Public discussion, mapping and walking activities examined how distance to daily destinations affects the choice of travel modes of people living in LHEs, what characteristics attract people and encourage them to choose certain paths in the

area, and what characteristics of streets make them “places” of social interaction” and supports the “function of place”.

Advancing the ‘15-Minute City’ in Turkey: A Framework for Sustainable Urban Planning and Governance in Mid-Sized Turkish Cities

Author: Emine Yetiskul¹

Co-author: Metin Senbil²

¹ *Middle East Technical University*

² *Gazi University*

Corresponding Authors: yetiskul@metu.edu.tr, senbil@gazi.edu.tr

This study explores the potential of Turkey’s mid-sized cities to align with the “15-minute city” concept, emphasizing proximity, inclusivity, and sustainability. These cities, characterized by compact urban areas where most residents live within a 3-km radius, inherently support walkable, proximity-based urban planning. However, rising automobilization and minimal car use restrictions along with uncoordinated transportation policies in Turkey pose significant risks to the realization of this concept. This research underscores the need for integrated transportation strategies, pedestrian-focused urban planning, and stringent parking policies to support 15-minute city while mitigating car dependence and fostering sustainable urban environments. Central to the “15-minute city” framework is the reorganization of urban functions to

ensure proximity within neighborhoods, necessitating systemic changes in resource allocation patterns and governance schemes (Pozoukidou and Chatziyiannaki, 2021). The concept also emphasizes principles of proximity, diversity, density, and ubiquity, aiming to reduce reliance on motorized transport while promoting sustainable and equitable urban living (Moreno et al., 2021). Practical frameworks for neighborhood-level transformations and multimodal connectivity with an emphasis on public engagement and behavioral shifts in Moreno (2024) are particularly relevant for Turkish cities in transition.

For Turkish cities, rethinking public transportation as the backbone of urban mobility is essential. Developing trunk transit systems free from regular traffic conditions can increase reliability and encourage shifts from private vehicle use. Public transport nodes, such as rail and bus stations, should be integrated into neighborhoods to support seamless multimodal connectivity while reducing car travel.

Pedestrian-friendly design is another critical component. Enhancing walkability through well-maintained sidewalks, safe crossings, and traffic-free inviting public spaces can significantly encourage active mobility. Walkable neighborhoods not only promote physical health but also contribute to cognitive well-being and social interaction, particularly among vulnerable populations like the elderly (Zhang et al., 2023). Moreover, pedestrian infrastructure must account for inclusivity, addressing the “last millimeter” challenges to ensure accessibility for all (Buliung, 2024).

Parking policies play a pivotal role in reducing car dependency. Stringent regulations, such as limiting parking availability in central areas and imposing higher fees, discourage car use and reclaim urban space for pedestrian and community activities (Núñez et al., 2024). Mixed land-use planning further supports proximity by ensuring essential services, amenities, and recreational spaces are distributed across neighborhoods, thereby fostering local economies and social cohesion (Pozoukidou and Chatziyiannaki, 2021).

While the theoretical underpinnings of the “15-minute city” are rooted in principles of proximity and inclusivity, practical implementation requires data-driven approaches. Tools like the Next Proximity Index (NEXI) can assess accessibility levels and identify gaps in urban planning, guiding tailored interventions (Olivari et al., 2023). Besides, the experiences of cities worldwide provide valuable insights. For instance, European cities with high pedestrian accessibility and diverse land use demonstrate reduced car reliance and enhanced urban equity (Vale and Lopes, 2023). Similarly, compact neighborhoods in ultra-dense cities like Shanghai showcase how mixed-use planning and walkability can foster cognitive and physical health (Zhang et al., 2023). These examples underscore the importance of adopting integrated urban design principles that prioritize human-centric planning over car-oriented development.

Although Turkey's mid-sized cities possess unique opportunities to lead by example in movement, transitioning to the “15-minute city” in these cities requires addressing existing challenges, including societal car dependency and fragmented urban governance. The study explores different traits of collaboration across for sustainable urban planning goals. Moreover, community engagement in planning processes ensures that interventions reflect local needs and aspirations, fostering public support and long-term success (Pozoukidou and Chatziyiannaki, 2021).

Are local living and transit-oriented development compatible? Conundrums in land use and transport integration policies in the transformation of Australian cities.

Author: Ian Woodcock¹

Co-authors: Jan Scheurer²; Hulya Gilbert³

¹ *The University of Sydney*

² *RMIT University*

³ *La Trobe University*

Corresponding Authors: ian.woodcock@sydney.edu.au, h.gilbert@latrobe.edu.au, jan.scheurer@rmit.edu.au

If recent policy announcements are to be believed, Sydney and Melbourne, Australia's two largest cities, appear destined for major disruptions driven by two headline policies being implemented in the third decade of the 21st century: transit-oriented development (TOD) and local living policies in the form of 15- and 20-minute neighbourhoods. These policies share complementary aims of reducing reliance on cars by creating mobility environments conducive to active and public transport. What interests us in this paper is whether they can overcome their inherently contradictory agendas: TOD seeks to cluster housing and non-residential uses around a limited number of railway stations and tram corridors; 15- and 20-minute neighbourhoods seek to provide access to daily living needs, including public transport, everywhere. However, Australian cities are among some of the world's most dispersed and car-dependent, creating enormous tensions between the aspirations of these policies have largely been imported from North America, which often gesture towards the desire for a more European urbanism, inflected by the recent discursive capture by 'x-minute cities' premised on travel time of much older planning concepts.

TOD policy in the Australian State of NSW, of which Sydney is the capital, aims to accommodate 74% of the state's housing target within the former '6 Cities Region' within 45 rail station-based precincts over the next 15 years; Victoria is aiming to accommodate 23% of new dwellings projected for its capital, Greater Melbourne within 50 rail and tram-based activity centres. Both states' local living policies have the ambition that everyone should be able to live in a 15- or 20-minute neighbourhood. These cities' populations are well over five million each and are projected to almost double by 2050 to over 9 million. Our analysis is twofold: Using SNAMUTS (Spatial Network Analysis for Multi-modal Urban Transit Systems) we seek to understand the trajectory of residential and other forms of urban intensification relative to accessibility by public transport in Sydney and Melbourne in the last decade. We then compare this analysis with the distribution and accessibility of core non-residential uses required for 15- and 20-minute neighbourhoods (retail, open space, schools and transit stops). From these two analyses of the spatial distributions of housing, amenities and mobility, we speculate on their future trajectories under current policy settings, in the context of the kind of mode shift that should accompany Australia's commitments to Net Zero by 2050.

Some conundrums appear as these speculations are developed: TOD (as implemented in Australia) is increasingly premised on the relative scarcity of high levels of transit network accessibility. Under such settings, what sort of land use and urban design policies might support the kinds of mode shift towards levels that would justify their recognition as 'Transit Oriented' urbanism, i.e. greater than 50 per cent public transport use? At the same time, what kind of transport, land use and urban design policies might support transitions so that the entire populations of Sydney and Melbourne can indeed choose

to live in metropolitan areas comprised entirely of 15- or 20-minute neighbourhoods? What can we learn from these speculations when we trace them back to the emergent urbanisms that we encounter in the current Sydney and Melbourne? What transformations will planners (and planning systems) need to undergo to facilitate the actual urban transformations that these core policies aspire to?

Exploring Interactions between Urban Rail Transit Network Characteristics and Station-Area Functional Morphology: A Typological Analysis and Flow Prediction of Shanghai Metro Based on Multi-Source Data

Authors: Yuhao SHI¹; Jinghao HEI²; Jiaming Xing¹; Yuxuan WANG¹

¹ College of Architecture and Urban Planning, Tongji University

² College of Design and Innovation, Tongji University

Corresponding Authors: heijinhao@tongji.edu.cn, 2430143@tongji.edu.cn, 2430346@tongji.edu.cn, 2430147@tongji.edu.cn

In the era of global crises, urban planning is confronted with multiple challenges, including climate change, social inequality, and resource scarcity. Urban rail transit networks, as critical infrastructure, significantly reshape urban spatial agglomeration patterns and morphological characteristics by guiding population flows (Yang et al., 2020). Consequently, they have become a vital lever for promoting urban sustainability and social inclusiveness (Xiao et al., 2021). In China, the transit-oriented development (TOD) model has emerged as a planning tool to address inefficient urban land use, guiding urban spatial expansion (Shen and Wu, 2020). As a result, the interaction between urban rail network structures and the functional differentiation of urban spaces needs a more comprehensive reassessment.

However, existing studies on typologies of station-area spaces often overlook the characteristics of the rail network itself (Feng et al., 2023), while passenger flow predictions tend to overemphasize the current network's flow patterns, neglecting the influence of land use and functional characteristics on transit usage (Zhang et al., 2024). To address these gaps, this study examines the Shanghai metro system from the dual perspectives of complex network analysis and functional morphological measurement. It aims to uncover the interaction mechanisms between station network characteristics and station-area functional morphology, employing typological induction to better capture real-world patterns and offering scientific and innovative insights for future urban transit planning through passenger flow predictions.

Our research unfolds in four stages:

1, We utilize complex network analysis to measure the network characteristics of all operational metro stations in Shanghai. Metrics such as betweenness centrality, closeness centrality, and eigenvector centrality are used to identify the structural roles and connectivity of stations within the transit network at the node level.

2, Station-area boundaries are defined using a 600-meter buffer or a 15-minute walking isochrone. Indicators across three dimensions—functionality, vitality, and environment—comprising 18 metrics in total, are measured to capture the spatial quality and functional characteristics of station areas at the place level. These two datasets form the foundation of our analysis.

3, We examine the interaction patterns between rail network characteristics and station-area functional morphology through descriptive statistics and correlation matrices. Results indicate that stations with high closeness centrality exhibit strong regional accessibility and overall transportation convenience. In contrast, stations with high between-

ness centrality serve as bridges for long-distance flows, facilitating interactions between different urban functional zones. Using the K-means clustering method, we classify Shanghai metro stations into six types: central homogeneous, suburban terminal, urban residential, central employment, urban public service, and suburban central. Typical station case studies validate the practical effectiveness of these classifications.

4, Using operational stations as the training set and unbuilt or planned stations as the testing set, we apply various machine learning models to predict future passenger flows. The random forest model achieves the highest prediction accuracy. SHAP analysis identifies key factors influencing passenger flow, including social media activity in station areas, floor area ratio, and office rental levels. Predictions highlight that the northern part of Line 19 in the Lujiazui area is likely to become a new high-traffic transit hub.

In conclusion, this study, adopting a synergistic perspective on rail transit networks and station-area functional morphology, provides scientific evidence for optimizing rail transit planning and urban spatial layouts. Based on clustering and prediction results, we propose resilience-based transit system strategies aimed at addressing the diverse mobility needs of different demographic groups while enhancing the adaptability of the transportation network. Our findings not only offer practical guidance for Shanghai's metro system planning but also call for a global reevaluation of urban transit development models in a fairer and more sustainable manner, providing insights into addressing challenges of inequality in infrastructure services.

Tactical urbanism, accessibility, and public participation: a mixed-method research and practice in Genoa, Italy

Author: Giovanni Lanza¹

Co-authors: Carla Baldissera¹; Paola Pucci¹; Paola Savoldi¹

¹ *Politecnico di Milano - DASTU*

Corresponding Authors: paola.pucci@polimi.it, carla.baldissera@polimi.it, giovanni.lanza@polimi.it, paola.savoldi@polimi.it

Several cities worldwide have adopted planning policies aimed at rethinking the role of public spaces to foster active mobility and social interaction. This trend, strengthened by the impacts of the COVID-19 pandemic, reflects growing awareness of the negative

externalities associated with the dominance of cars in urban environments. Through interventions that reorganize the form and use of public spaces, shifting away from configurations that solely prioritize vehicle circulation and parking to those that support a plurality of social practices and sustainable mobility modes, the groundwork is laid for a broader paradigm shift: from car-centered models of public space to people-oriented designs.

The benefits of enhancing urban spaces and mobility systems to be more accessible and inclusive for all, especially for vulnerable populations, are manifold. These include fostering social interaction to prevent isolation, encouraging active mobility behaviors, and addressing the climate crisis by reducing CO2 emissions and enhancing urban ecosystems. Thus, transforming car-oriented public spaces is essential to achieving more sustainable, equitable, and active mobility-oriented urban environments.

Nevertheless, implementing these transformative processes presents significant challenges for both cities already undertaking these initiatives and those seeking to initiate them. First, such efforts challenge deeply rooted car-oriented cultures. Second, public space transformations operate on a highly contested resource, where conflicts often emerge regarding the uses, perceptions, and desires of different actors. As a result, interventions undertaken without a deep contextual understanding of local users' needs and preferences, or without anticipating potential conflicts arising from the transformation, risk being ineffective and jeopardizing the transition toward more sustainable and inclusive cities.

These challenges underline the importance of tactical urbanism, an approach to urban transformation characterized by its incremental, temporary, and experimental nature. This approach enables cities to overcome resource limitations and project uncertainties, while its participatory methodology helps mitigate divergences and potential conflicts. Public participation, central to the process of tactical urbanism, promotes citizen engagement and co-production of design solutions, fostering consensus and avoiding the negative outcomes associated with top-down imposed changes. However, the need for public engagement introduces additional challenges for public actors advocating tactical urbanism which need to i) prioritize intervention areas based on specific selection criteria; ii) effectively engage citizens; and iii) mediate between the - often divergent - preferences of citizens and the technical, legal, and financial feasibility of the proposed interventions.

While many cities worldwide have successfully addressed these challenges, others continue to struggle with developing effective strategies for change.

Building on these considerations, this paper examines a research project in Genoa, Italy, undertaken in collaboration with the Municipality to implement the city's first tactical urbanism pilot interventions. Currently being developed as part of the Genova Street Lab living lab initiative, these interventions focus on creating and enhancing public spaces through pedestrianization, installing urban furniture to promote conviviality, and supporting community-driven active mobility practices. A cornerstone of the initiative was the development of an innovative and scalable mixed-method approach to identify suitable intervention areas and involve the local population in co-designing public space solutions. This methodology combined quantitative GIS-based analysis, surveys, interviews, on-site inspections, and co-design sessions to achieve a comprehensive understanding of local challenges. It enabled the identification of priority areas for intervention and supported a shared process of envisioning and co-producing people-centered spaces.

The mix-method participatory approach, tested within the concrete policy decision-making process experimented in Genoa, is detailed in this paper. It addresses the challenges encountered and discusses the potential of integrating the tactical urbanism approach into institutionalized planning processes, thereby fostering a transition toward more inclusive, sustainable, and people-centered mobilities and urban environments.

Barcelona's Superblocks: from grid to block. The iterative design and implementation process of an urban planning concept.

Author: Simon De Boeck¹

Co-authors: Maarten Van Acker¹; Thomas Vanoutrive¹

¹ *University of Antwerp*

Corresponding Authors: maarten.vanacker@uantwerpen.be, thomas.vanoutrive@uantwerpen.be, simon.deboeck@uantwerpen.be

Broader research frame setting the stage

Urban public spaces are under significant pressure due to acute scarcity, unequal accessibility, and insufficient versatility, leading to a lack of opportunities for human encounters and complicating solutions to environmental, climate, and health-related challenges. Moreover, the deficiency of green public spaces particularly impacts the socio-economically most vulnerable populations (Anguelovski et al., 2018; Konijnendijk, 2018; Low, 2006; Rees, 1997; Sauer, 1925). In response to these challenges, cities around the globe are proposing new 'paradigmatic' concepts to radically transform urban public spaces from monotechinic car-dominated infrastructures to polyvalent people-centred public places (Mumford 1938), serving a broad spectrum of sustainable development goals (Sennet, 2019). Frequently cited examples that inspire policy mobility in cities worldwide include Medellín's Social Urbanism (Maclean, 2015), New York's Street Fight (Sadik-Khan and Solomonow, 2016), Barcelona's Superblocks (Rueda, 2019), and Paris' 15-Minute City (Moreno, 2020). However, between the conception of the paradigm and its realisation lies a challenging implementation process, during which both the level of ambition and the initially set –sometimes conflicting –goals inevitably come under pressure (Chombart de Lauwe, 1964; Cohen, 2017; Gössling, 2020).

Article abstract

This case study examines the design and implementation process of Barcelona's ambitious and highly debated Superblock concept. The iconic spatial figure of a Superblock consists of the aggregation of three-by-three building blocks into a car-free qualitative and liveable public space, aiming to serve as a building stone for city-wide transformation. Design experts initially advocated a rapid and systemic roll-out, using tactical urbanism, on a large scale to achieve promising social, environmental, and health-related goals (Mueller et al., 2019; Rueda, 2019). However, a profound shift emerged during the iterative implementation process, from the 'archetypal' model at the neighbourhood scale to a 'green axes and squares' model at the grid scale and from branding tactical urbanism to striving for structural interventions (Honey-Rosés, 2023; Magrinyà, 2023).

This article unfolds how and why the concept design evolves during its iterative implementation process and how this affects its potential transformative impact. The investigation employs a mixed-methods case study approach, including a graphical analysis of concept evolutions based on a study of policy documents and site observation, as well as expert and elite interviews that provide insight into the arguments and perceptions during the implementation process.

As a travelling concept, the Superblocks have inspired similar initiatives worldwide, such as Supermanzanas in Vitoria-Gasteiz, Kiezblocks in Berlin, Supergrätzl in Vienna (Aumann et al., 2023), and have been introduced in New York (The New York Times, 2016),

several Latin-American capitals (Rueda, 2019), and Los Angeles (Li and Wilson, 2023). However, all sources predominantly refer to the initial archetypal Superblock concept, while little to no reference is made to the agile implementation process and subsequent conceptual evolutions in Barcelona over the past decade. This analysis offers insights for planners and policymakers worldwide on adopting similar transformative concepts to achieve disruptive change within their urban contexts.

Revisiting Functional Density: Balancing Proximity and Hub-Based Mobility in the Seoul Metropolitan Region, South Korea

Author: Jihun Mun¹

Co-authors: Jae Seung Lee²; Saehoon Kim²

¹ *Interdisciplinary Program in Landscape Architecture, Seoul National University*

² *Seoul National University*

Corresponding Author: munjihun@snu.ac.kr

Cities today are shaped by a dynamic interplay of population growth, diverse services, and digital connectivity. As remote working and online interactions continue to expand (Moreno et al., 2021), scholars and practitioners alike have intensified their focus on multi-dimensional density—encompassing physical, social, and functional aspects—and its impact on accessibility, productivity, and quality of life. While higher-density development often ignites innovation and urban vibrancy (Jacobs, 1961; Glaeser, 2011), it can also exacerbate congestion and housing cost pressures. Conversely, lower-density environments may offer space and comfort yet face inefficiencies in service provision and transportation (Cervero and Kockelman, 1997). These opposing forces highlight the need to harmonize neighborhood-scale proximity with the advantages of well-served central hubs.

Within this discourse, functional density—the spatial mix of commerce, culture, education, leisure, and related facilities—stands at the crux of two potentially complementary but sometimes competing development objectives. One seeks to leverage agglomeration benefits in key urban nodes, while the other prioritizes localized services through more dispersed approaches such as the “n-minute city” (Moreno et al., 2021). Although many studies have implied a generally positive link between facility mix and travel outcomes (Cervero and Kockelman, 1997), limited attention has been paid to potential trade-offs between hub-oriented intensity and everyday convenience. A more nuanced perspective is required to capture how total trip volumes, internal trip ratios, and a district’s overall attractiveness to leisure-seeking travelers are influenced by variations in functional density.

This study examines whether a balanced level of functional density can enhance local accessibility and manage external inflows without diminishing broader urban performance. We focus on weekend non-commute travel in 1,150 administrative districts across the Seoul Metropolitan Region, capturing both total trip volumes and intra-district travel ratios as dependent variables. Our independent variables include cultural, dining, and recreational facility indicators, population density, land-use diversity, daytime population ratios, and travel distance/time metrics. By excluding job-related measures, we aim to isolate leisure-oriented movements that increasingly shape urban travel behavior (Ewing and Cervero, 2010).

Methodologically, we employ a gravity model-based Ordinary Least Squares framework, incorporating both travel flows and spatial attributes. This enables us to quantify how varying degrees of functional density influence people’s propensity to remain within their local district or travel longer distances for leisure and social activities. Preliminary results suggest that moderate but well-distributed facility mixes can reinforce neighborhood cohesion, reduce external trip generation, and ease congestion. However, excessive concentration of key amenities can draw substantial inflows, triggering local congestion, escalating real estate costs, and uneven urban development.

By systematically examining these dynamics in a major metropolitan setting, this research provides empirical insights for identifying “optimal density” strategies that simultaneously promote sustainability, equity, and urban vitality. The paper concludes with policy recommendations on facility distribution, zoning, and regional planning approaches, aiming to guide urban decision-makers toward balanced development that harmonizes local living with the synergies of vibrant central nodes.

Off the Beaten Track: Uncovering Rural Voices in the Conflict over the Future of Cycling in Bavaria

Author: Anna Loffing¹

¹ *University of Vienna, Austria*

Corresponding Author: a12352394@unet.univie.ac.at

As societies strive for sustainability, the mobility transition emerges as one of the most pressing challenges of spatial planning, influencing not only transportation networks but also the interconnected systems of energy, housing, and social infrastructures. This presentation addresses the challenge of achieving a socio-ecological mobility transition that considers diverse spatial structures. Whereas urban areas often receive more attention in sustainable mobility policies, rural regions in the European Union remain largely underserved, with a “near-total absence of specific policy for mobility” (Flipo et al., 2023, p. 136). As a result, rural areas continue to be heavily reliant on cars, which impacts both social equity and environmental sustainability (Flipo et al., 2023; Székely and Novotný, 2022; Vitale Brovarone and Cotella, 2020). Despite the important role of civil society actors in mobility transition conflicts (Frantzeskaki et al., 2016), existing research often overlooks rural contexts. Many rural stakeholders feel excluded from decision-making in climate and energy policies (Zilles and Marg, 2023). At the same time, the conflict lines are much more complex than a simple urban-rural divide (Fienitz and Siebert, 2021). This presentation argues that rural areas require more focused attention, given the distinct civil society dynamics, for example regarding the role of volunteering, informal political activities, and personal relationships in rural mobility struggles.

A qualitative case study of the conflict over cycling conditions in the southern German federal state of Bavaria (2017-2023) provides insights into the role of rural stakeholders in mobility transition conflicts. This case study explores the escalation of the conflict following the formation of a broad civil society alliance advocating for a Bavarian Cycling Law. Unlike other German initiatives, this campaign actively involved rural regions, recognising that over half of Bavaria's population lives in rural areas. Based on expert interviews, media coverage, documents, and field visits, the study identifies several key characteristics of the conflict in rural contexts:

- *Conflict context:* The debate over cycling conditions in Bavaria is deeply embedded in the broader political discourse on achieving equal living conditions between rural and urban areas.
- *Conflict objects:* In contrast to urban cycling debates, rural conflicts primarily centred around issues like the acquisition of agricultural land for intermunicipal cycle paths, nature conservation concerns, and the conflicting needs of everyday and tourist cyclists.
- *Conflict actors:* Key stakeholders in rural areas include farmers' associations, which are crucial for resolving conflicts, yet their involvement in cycling mobility debates has been limited.
- *Conflict dynamics:* The mobilisation for the Bavarian Cycling Referendum in 2023 was strategically timed before the state elections, limiting the time for signature collection in rural areas. This short timeframe was challenging for rural counties lacking established civil society networks, where more time was needed to build support.
- *Conflict modes:* In rural regions, personal relationships play a significant role in communication, and the success of mobilisations often depends on committed individuals, as it is difficult to mobilise the public around issues such as cycling. At the same time, the effect of greater networking and capacity building in civil society can be seen - in some cases, but not everywhere - in the mobilisation for the Cycling Referendum in Bavaria.

Coming from a background of spatial planning research and applying the conceptual approach of a multi-level analysis of spatially embedded conflicts, I contribute new perspectives to mobility research. The empirical findings contribute to a better understanding of mobility transition conflicts and the role of civil society actors in rural areas and thus have broader implications beyond the areas studied.

The 15-minute city center: A comparative analysis of the cities of Thessaloniki and Hanover.

Authors: Lena Greinke¹; Linda Lange¹; Johanna Richter¹

¹ *Leibniz University Hanover, Institute of Environmental Planning*

Corresponding Author: greinke@umwelt.uni-hannover.de

The concept of the 15-minute city goes back to the urbanist Carlos Moreno and by no means exclusively involves new ways of thinking and planning: A city of short distances with a social and functional mix has existed in urban planning concepts since the 1980s and still exists today (Kurth, 2021, p. 28). Moreno focuses on reducing car traffic and defined the 15-minute city in 2016, in which essential things should be within a maximum distance of 15 minutes on foot or by bicycle in cities (Moreno et al., 2021, p. 100f.). The concept aims to create self-sufficient urban districts with the essential functions of living, working, retail, health, education, and entertainment by decentralizing urban functions and services (Khavarian-Garmsir et al., 2023, p. 10) and thus counter the negative consequences of a city focused on car traffic with urban development that reduces traffic (BBSR, 2020-2024). Among other things, the aim is to create environmentally friendly, efficient transport alternatives to car traffic and improve public transport infrastructure (Büttner et al., 2024, p. 4). As cities are mostly polyrhythmic and polychronic, Moreno's 15-minute city shifts the focus from "urban planning" to "planning urban life" (Abdelfattah et al., 2022, p. 331).

This paper aims to compare the extent to which the 15-minute city concept can contribute to the sustainable urban development of Thessaloniki and Hanover and where the cities currently stand with regard to the shift towards walking and cycling as part of the DAAD university partnership "Centers of the Future - Challenges and Opportunities for Sustainable Development (ZukunftZentren)." Conceived in the past as car-friendly cities, the developments of the two cities now differ significantly from each other and offer different approaches to implementing the 15-minute city concept. As a starting point and connecting element, the article focuses on the aspect of mobility - especially walking and cycling.

A literature analysis (according to Brink, 2013, p. 46ff) is first used to develop the basics

of the 15-minute city concept. Participant observations (according to Bachmann, 2009) are carried out in both cities during various research visits, and urban development is systematic, standardized, and recorded. Based on the main topic of mobility, the potentials, and challenges of the two cities of Thessaloniki and Hanover are then compared verbally and argumentatively concerning the development of the 15-minute city concept. The decentralization of urban functions and mixed uses has already been implemented in both Thessaloniki and Hanover in isolated cases, which shows that such a transformation is possible. For both cities, which have been developed with a strong focus on the car, a development towards a 15-minute city can be particularly challenging (Khavarian-Garmsir et al., 2023, p. 12). Often, pure densification and concentration of functions are not enough; instead, it is advisable to use central locations such as train stations, for example, and to optimize uses and locate services there (Abdelfattah, 2022, p. 331), which, fundamentally contradicts the concept of the 15-minute city. In Thessaloniki, however, such mixed uses help revitalize the city. This could also be an option for the city of Hanover to shape the transition actively.

Although neither Thessaloniki nor Hanover are 15-minute cities, they are both on the road to transformation. The direction they ultimately take depends heavily on political decisions and the resources and framework conditions in the cities.

Identifying intermediate territories through mobility patterns

Authors: Federico De Angelis¹; Paolo Beria¹

¹ *POLITECNICO DI MILANO*

Corresponding Authors: federico.deangelis@polimi.it, paolo.beria@polimi.it

Sustainability strategies in the mobility sector are often concentrated on large metropolitan hubs or on main transport corridors. On the one hand, in fact, cities have been a field of experimentation for a mobility model alternative to the car-centric one. On the other, resources and institutional efforts have been concentrated to create and strengthen direct connections between them, especially high-speed ones.

Italy is a clear example of that, and the result is that the non-core territories have been underrepresented in the policy agenda, in a country where large cities account for 32% of population. At the margins of the agenda have remained both the remote areas of the country, which do not intrinsically express sufficient mobility demand to be considered by policies of national scope, but also all those areas that make up the “In-between Italy” (from now on Italia di Mezzo), that sum up to 62% of Italian population. Usually, these areas are only considered as an extension of metropolitan commuting basins and with little functional autonomy. To the contrary, innovative and targeted policies would be necessary for these areas, since merely adapting on a smaller scale the strategies implemented in metropolitan territories has proven to be ineffective. The first fundamental step, however, is to identify these territories.

The aim of this paper is to present a methodology that can recognize, isolate and describe the possible Italia di Mezzo exclusively with data related to mobility demand. To build this methodology we relied on consistent and large-scale data, the ISTAT “origin-destination matrix of travel for work or study reasons” of 2011, that however deliberately but necessarily excludes other kinds of mobility, i.e. those linked to leisure, free time and the use of services in general.

First, the matrix data is processed to obtain some significant novel indicators that can allow a first convincing and consistent exploration of the different “Italies”. These indicators are presented and spatialized for all the municipalities, explaining all their qualities but also limits. They are grouped in three categories: flow indexes, dependency indexes and geographical indexes. Since these indexes alone are not able to present such a clear and uniform picture of the Italia di Mezzo from the point of view of commuting mobility, in the second part, through an incremental process, we proceed by composing these indexes and creating a tentative classification. In doing that, we define this Italia di Mezzo by exclusion, eliminating the metropolitan areas (basically metropolitan mobility poles and their commuting basins) and the more remote areas.

In the conclusions we discuss the main outcomes of the indexes and the classification operation, and we also build some possible interpretative considerations about what kind of Italian territories make up the Italia di Mezzo of commuting mobility. More specifically, their consistency in quantitative terms and their degree of homogeneity or possible sub-categorization, also considering the relation between their mobility demand and infrastructures supply.

The research is funded by the European Union - Next Generation EU, in the framework of the GRINS - Growing Resilient, Inclusive and Sustainable Project (GRINS PE00000018 –CUP D43C22003110001). GenAI Street Experiments: Introducing a Critical Framework for Generative Artificial Intelligence in Urban Design Teaching

Author: Caterina Villani¹

Co-author: Toka Fahmy Abdelmutleb¹

¹ *University College Dublin*

Corresponding Authors: toka.abdelmutleb@ucdconnect.ie, caterina.villani@ucd.ie

Street experiments are increasingly adopted as planning measures to help communities visualize “radically different arrangements of the urban mobility system” (Bertolini 2020). These interventions foster active mobility and public life through relatively short-term, low-resource, and small-scale spatial transformations that enable “here and now” changes to streetscapes. Despite their potential, such transformations often require significant spatial interventions, resources, and institutional and community support. Inadequate or unresponsive design remains a recognized barrier to their broader implementation (VanHoose 2023).

The recent rise of generative artificial intelligence (GenAI) tools promises to disrupt how cities are planned and designed. Some of these tools aim to empower diverse stakeholders to “reinvent their streets” while creating “happier and healthier environments” (NL Netherlands 2025). For instance, certain tools visualize how adopting a cycling lifestyle or adding outdoor seating could transform a specific street. As educational exercises, GenAI tools offer opportunities to envision alternative futures. However, mobility injustice remains a pressing concern, underscoring the need for planners to critically engage with these technologies.

In this presentation, we draw on our experience designing and teaching a course focused on fostering critical skills for engaging with GenAI in urban design. Using relevant frameworks, we discuss how these tools can be integrated into planning education, emphasizing the need to analyze their outputs critically and understand their potential impacts on urban mobility and equity.

Assessing the Impact of Urban Rail Transit on Urban Vitality: A Big-Data-Based Approach

Author: Wenyu Lyu¹

Co-author: Mi Diao²

¹ *Tongji University*

² *Tongji university*

Corresponding Authors: diaomi@tongji.edu.cn, 2230101@tongji.edu.cn

Transit-Oriented Development (TOD) aims to guide urban development through rail transit, with rail transit stations serving as pivotal urban nodes for the concentration of people and urban activities. The opening of new rail transit lines can increase the attractiveness of the station areas by improving accessibility and fostering changes in land use and amenities, thereby enhancing urban vitality. While numerous studies have shown the impact of rail transit stations on travel behavior and property values, few have provided empirical evidence on the vitality changes in the station areas.

Employing a difference-in-differences (DID) modeling framework, we assess the impact of rail transit on the urban vitality of the station areas, using the opening of Shanghai Metro Line 15 as a natural experiment. The urban vitality is measured by the number of residents, workers, and visitors clustered in the station areas, along with the visiting frequency, duration of stay, and distances from the stations to the homes of visitors, using a large mobile signaling dataset from 2017 to 2021 in Shanghai. We define the treatment group as areas close to the metro stations (within 500 meters of the station) and the control group as areas further away from the stations (beyond 500 meters), ensuring that the closest station for both the treatment and control groups is a Line 15 station. We find that the opening of a new metro station can increase the overall population clustered, number of visitors, and their visiting frequency in the treatment areas, relative to the control areas. Despite an increase in the number of visits, the duration of stay of visitors per person in the treatment areas has decreased. Additionally, the visitors reside in areas more distant from the metro stations after the opening, suggesting a broader influence radius of the stations.

The rail transit effects on urban vitality show significant spatial and temporal heterogeneity. We adopt a Difference-in-Difference-in-Differences (DDD) model to investigate the spatial heterogeneity of the effects between interchange and non-interchange stations, as well as stations inside and outside the outer ring road of Shanghai. The results show that the interchange stations have significantly higher attractiveness to visitors and higher visiting frequency increase compared with normal stations. Compared to stations within the outer ring road, stations located outside the outer ring road attracted more residents and visitors from further distances. To explore temporal heterogeneity, we divided the study period into weekdays and weekends, conducting DID regression for both groups separately. The results revealed that, the rail transit effect in attracting more people, especially more visitors, is higher on weekdays than on weekends.

This study combines big data and DID analysis to assess the treatment effect of rail transit on urban vitality and uses several years of panel data to capture the dynamic changes in vitality. The research findings have significant policy implications for TOD and initiatives to enhance the overall livability and attractiveness of urban spaces.

Assessing Urban Mobility Resilience: The Combined Impact of Physical and Socio-Economic Systems on Bike-Sharing in Extreme Heat

Authors: Zeyin Chen¹; Siying Li²; Tao Wu¹; Xiuning Zhang³; Renlu Qiao¹; Jingkai Zhao¹

¹ Tongji University

² *Tsinghua University*³ *University College London*

Corresponding Authors: qiaorl@tju.edu.cn, taowu@tongji.edu.cn, zet@tongji.edu.cn, xiuning.zhang.23@ucl.ac.uk, lsy_catnip@163.com, jingkaizhao@tongji.edu.cn

Global climate change has led to an increase in extreme heat events, which significantly impacts urban mobility, particularly bike-sharing systems. While considerable research has focused on the effects of the physical environment on urban mobility resilience (UMR), few studies have addressed the socio-economic impacts, and even fewer have examined the combined influence of both systems. This study explores the comprehensive effects of the physical environment and socio-economic systems on the UMR of bike-sharing in Shanghai during extreme heat events, using machine learning and an unbiased data-driven approach known as Accumulated Local Effects (ALE).

The study introduces a novel method to quantify UMR by calculating the ratio of bike usage during heat to normal usage in a given spatial unit. A range of physical and socio-economic factors are incorporated into the analysis. Methodologically, LightGBM models are applied to assess UMR in relation to physical and socio-economic systems separately, followed by an integrated model that combines both systems to analyze their joint impact on UMR. The study not only explores the numerical relationships but also examines the spatial distribution patterns of UMR. Results show that the integrated model provides stronger explanatory power, revealing significant coupling between the physical and socio-economic systems in determining UMR.

Key findings include: (1) Resident class significantly impacts UMR of bike-sharing. Affluent residents, who often live in areas with ample greenery and larger housing units, are less reliant on bike-sharing during extreme heat, preferring more comfortable transport modes such as private cars. Conversely, less affluent residents, especially those in areas with low economic activity and high building density, depend more on bike-sharing, even during extreme heat. (2) High-quality and accessible consumption areas positively influence UMR. Areas with high consumption quality, such as popular restaurants, attract more cycling trips even in extreme heat. Urban sub-centers, with their abundant job opportunities and short travel distances, further support high UMR, particularly on hot weekdays, underscoring the role of economic consumption in enhancing urban mobility resilience. (3) Functional facilities, particularly large buildings in densely populated areas, boost UMR by encouraging cycling during heat events. However, old urban areas often suffer from inadequate bike-sharing infrastructure and poor accessibility, which undermine resilience, especially under extreme heat. In areas with high public transport density, competition between bike-sharing and other transport modes may arise, as people tend to opt for walking or public transport in extreme heat. (4) Adequate public spaces play a crucial role in mitigating high urban temperatures, promoting cycling in hot conditions, and enhancing UMR. Parks and well-developed public transport systems are especially beneficial for affluent residents in supporting cycling on weekends. Furthermore, public spaces with cultural or historical significance, such as those in downtown areas, can stimulate bike-sharing usage, benefiting both residents and tourists through accessible, leisure-oriented spaces. (5) Population density plays a crucial role in enhancing UMR. In area with low-rise buildings and larger rental areas, increased population density can promote resilience by fostering a neighborhood atmosphere, which encourages higher bike-sharing usage, particularly on weekends.

To improve UMR, the study suggests enhancing cycling infrastructure, including bike lanes and easily accessible bike-sharing stations, and integrating the bike-sharing system into the broader public mobility network. Urban planning should focus on the balanced distribution of high-quality consumption areas, green spaces, and multifunctional spaces, while optimizing connectivity between cultural hubs and considering building morphology to mitigate heat and enhance comfort. Special attention should be given to regenerating infrastructure in older downtown areas and promoting sustainable mobility in affluent areas. This research provides new insights into the complex mechanisms that influence UMR and offers valuable recommendations for urban governance and climate adaptation strategies.

Why Cycle Through Rain and Wind? A retrospective exploration of behaviors, attitudes, and habits.

Author: Ran Zhang¹

Co-authors: Marco te Brömmelstroet¹; Anna Nikolaeva¹

¹ *University of Amsterdam*

While there is a global push towards active mobility, many regions encounter challenges in achieving successful transformative action. Nonetheless, intriguing exceptions exist, such as in the Netherlands, where individuals adopt active modes like cycling despite adverse weather conditions. This phenomenon suggests that travel decisions are not merely considered decision but also habitual travel choices.

This study utilizes Cognitive Dissonance Theory to examine the complex interplay between attitudes and behaviors that drive individuals in the Netherlands to cycle in challenging weather. The analysis focuses on the attitudes of individuals who hold a positive disposition towards cycling in adverse conditions, highlighting the social and cultural factors that reinforce this attitude. It also examines those who, despite holding negative attitudes, continue to bike frequently in poor weather, revealing the presence of attitude-behavior dissonance and the reasons for the lack of behavioral change. This indicates that people often seek to reduce cognitive effort and decision-making pressure by relying on ingrained routines.

The research uncovers nuanced self-justifications and the ways in which ingrained habits outweigh discomfort, influenced by socio-cultural factors such as cultural symbols, peer pressure, social norms, social media signals, shared values, and habitual behaviors formed during upbringing. These findings emphasize the need to shift the focus of active mobility promotion beyond physical infrastructure, advocating for strategies that are adaptable to local conditions and cultural contexts rather than replicating a single-country or single-culture development model.

Who lives (in) the 15-min city? Sociodemographic insights into the 15-minute lifestyle in Barcelona.

Author: Monika Maciejewska¹

Co-authors: Jerònia Cubells¹; Oriol Marquet¹

¹ *Universitat Autònoma de Barcelona*

The 15-minute city concept has gained prominence as a sustainable urban planning framework, advocating for the localization of daily activities by ensuring that essential services and amenities are accessible within a short walk or bike ride from residences. However, this concept raises a critical question: does living in high accessibility conditions inherently lead to proximity-based lifestyles? This study investigates the sociodemographic factors influencing the adoption of such lifestyles in Barcelona, a dense, compact urban environment celebrated for its high accessibility.

Utilizing detailed travel behavior surveys and highly disaggregated spatial datasets, the research examines the relationship between residents' proximity to 25 key destinations—such as schools, health facilities, and markets—and their actual travel practices for non-commuting purposes. Despite 95% of Barcelona residents living within areas that meet 15-minute city criteria, only 26% consistently engage in localized travel patterns for these trips. This reveals a significant gap between the potential of the built environment and actual behavioral outcomes.

The study identifies several sociodemographic determinants that mediate this gap. Women, older adults, and individuals with lower educational attainment are more likely to adopt a proximity-based lifestyle, whereas younger adults and highly educated individuals display a preference for extended travel patterns. These variations reflect broader societal and cultural dynamics, including preferences for specialized services, diverse amenities, and entrenched mobility habits.

Moreover, the findings challenge a core assumption of the 15-minute city model: that spatial accessibility alone can drive behavioral change. The study highlights the role of cultural norms, social networks, and individual preferences in perpetuating long-distance travel, even in accessibility-rich environments. For effective implementation, complementary policies such as restrictions on car use, incentives for localized services, and targeted educational campaigns are necessary to address behavioral inertia and mobility norms.

By revealing both the barriers to and opportunities for fostering proximity-based lifestyles, this research provides critical insights into the translation of built environment potential into equitable and sustainable urban living. These findings contribute to the ongoing discourse on the practicality and adaptability of the 15-minute city model in diverse urban contexts.

The walkability potential matrix –a new method for measuring walkability potentials in town and city centres

Author: Akkelies van Nes¹

¹ *Western Norway University of Applied Sciences*

Corresponding Author: avn@hvl.no

The object of this present study is to reveal the spatial configuration of 55 Norwegian towns and cities related to degree of walkability potentials. The aim is to investigate to what extent the street or road profile affect the walkability potentials in the town centres based on the distribution of roads in comparison of streets based on street names. The reason as to why we focus on the town centres, is that they tend to have the largest walkability potentials. For this, we used the last part of the street or road names to identifying whether it is a balanced street or a road encouraging car use. Likewise, we counted the number of X and T junctions in the town centre. Correlations between T and X junctions were made, and correlations between road and streets were made for the town centre of all 55 Norwegian towns and cities.

The results show that the higher number of X-junctions in correlation with T-junctions, the shorter urban blocks, implying higher degree of walkability potentials in the town centres. Likewise, the higher numbers of streets in correlation with roads in a town centre, the higher degree of facilitation of pedestrian friendly pathways. Three different clusters are identified in the statistical analyses, in which comply with the reputations the various town and city centres have regards walking attractiveness or private car dependency. The higher number of X-junctions in correlation with T-junctions, the more integrated the town centre is on a local as well as global scale. Likewise, the higher number of streets in correlation with roads, the more integrated the town centre is. Finally, the more the town or city centres have an orthogonal grid structure consisting of streets, the higher integration and thus higher walkability potentials.

The method is a first step to have some operational tools to measure degrees of walkability potentials in town and city centres.

Planning that contributes to more utilitarian walking: The context of a Norwegian 'small city'

Author: Harpa Stefansdottir¹

Co-authors: Maja Karoline Rynning²; Sebastian Peters³; Tanu Priya Uteng²

¹ *Agricultural University of Iceland*

² *Norwegian Centre for Transport Research*

³ *Norwegian University of Life Sciences*

The WALKMORE project addresses a critical aspect of planning and developing efficient and sustainable transport systems for the future: encouraging more walking. This is examined within the context of small Norwegian cities from both planning and user perspectives, through three main research activities (WPs):

1. Examining planning processes that shape the built environment.
2. Investigating the effects of built environments on walking behaviors and pedestrian perspectives.
3. Conducting pilot projects, using a tactical urbanism approach, to explore small-scale changes to built environments at the street level that may influence walking behaviors and enhance the attractiveness of walking.

To our knowledge, this is one of the first large-scale projects in Norway specifically addressing land use and transport planning for walking, particularly in the context of small cities. Walkability is closely tied to geographical and contextual factors, including the size of a city. In small Norwegian cities, typically with populations of 10,000–15,000, short distances offer significant potential for walking. However, the private car remains the dominant mode of transport.

We adopt a multidisciplinary, mixed-methods approach, executed through case studies in Narvik, Steinkjer, and Kongsvinger. This paper synthesizes results and experiences from the three main research activities of the project. It analyzes and discusses the implications of these findings for future urban development, land use, and transport planning.

A central question to be addressed is: *How should land use and transport systems, from the city to the street level, be planned and developed—considering both processes and projects—to ensure high levels of walkability and encourage more walking?*

Urban freight mobility modes recognition classification and inclusive freight policy exploration based on truck trajectory data: A case study of Shanghai, China

Author: Jia Wei¹

Co-authors: Shangwu Zhang²; Quan Yuan³

¹ *Urban Mobility Institute, Tongji University, Shanghai, China*

² *College of Architecture and Urban Planning, Tongji University, Shanghai, China*

³ *College of Transportation, Tongji University, Shanghai, China*

Corresponding Authors: weijiascut@163.com, zhshangwu@tongji.edu.cn, quanyuan@tongji.edu.cn

The movement of goods is integral to the daily lives of households and the operations of businesses, influencing the development of cities. In high-density urban areas such as Shanghai, China, trucks serve as the primary agents of goods transportation, yet they confront strict constraints. Studying the behavior patterns of urban freight car flows can reduce costs and enhance efficiency within the freight transportation industry, thus promoting sustainable economic development. Moreover, it is an inevitable requirement for refining urban traffic management, improving road network operation efficiency, and constructing sustainable urban traffic models. In recent years, the availability of high-frequency tracking data for trucks has greatly improved, facilitating the study of truck flow laws and the excavation of truck activity patterns from a microscopic perspective. There is room for continuous improvement in the methodological system for processing and analyzing truck activity data, as well as in the construction of flow patterns and models.

Based on high-frequency GPS tracking data of heavy trucks in Shanghai, this study explores and identifies different patterns of urban freight flow, and proposes freight-friendly policies and planning suggestions for an inclusive, efficient, and sustainable urban transport system, aiming to build an inclusive, sustainable, and innovative freight-friendly urban transport system. Initially, the basic travel information of heavy trucks is accurately obtained by preprocessing the GPS data of a large number, which includes stop point identification and map matching. Subsequently, the temporal and spatial characteristics of truck travel are described in terms of duration, frequency, spatial distance, scope, and infrastructure usage. By integrating data on land use, enterprise registration points of interest (POIs), transportation hub areas of interest (AOIs), etc., the activity purposes of trucks are inferred, variable sets are established, and these variable sets are subjected to two-step clustering to conclude typical truck activity patterns.

According to the clustering results, the patterns can be classified into two main categories and five sub-categories: wholesale and retail goods transportation (intra-city short-distance wholesale and retail mode, inter-city short-distance wholesale and retail mode); and inter-city and short-haul freight (inter-city and short-haul transit mode, inter-city long-distance heavy industry mode, mixed short-haul logistics mode). These different modes exhibit significant differences in terms of various characteristics in time and space. Based on these findings, this study proposes targeted management suggestions. For instance, more detailed traffic requirements are suggested for short-distance wholesale and retail trucks within the city. Real-time monitoring of peak hours and areas prone to traffic congestion, combined with big data, is recommended, along

with flexible traffic restrictions. To promote inclusiveness, appropriate toll subsidies should be provided for trucks with a mixed medium and short-distance logistics mode that are highly dependent on expressways.

The value of this study lies in the innovative use of freight-related data to explore freight mobility rules from a micro perspective. It points out the shortcomings of the current urban "one-size-fits-all" policy and the lack of consideration for the characteristics of different modes and needs in different periods within macro and general management and control. The research provides a scientific basis for the refined management of urban freight mobility and the construction of freight-friendly and sustainable urban transportation systems. In the future, urban mobility policies related to freight transport can be formulated and managed according to different freight modes, and an innovative, diversified and inclusive urban freight transport system can be built according to local conditions, promoting freight mobility to reduce costs, and fostering sustainable social and economic development. Additionally, the research integrates perspectives and thinking from urban planning, transportation, economic management, politics and other disciplines, providing referential ideas and methods for interdisciplinary and similar research and practice in other cities.

Framing micromobility in Flanders (Belgium): an exploratory discourse analysis

Author: Ward Van Hemeledonck¹

Co-authors: Eva Van Eenoo ; Kobe Boussauw²

¹ *Vrije Universiteit Brussel*

² *Vrije Universiteit Brussel - Cosmopolis Centre for Urban Research*

Corresponding Authors: kobe.boussauw@vub.be, ward.van.hemeledonck@vub.be, eva.van.eenoo@vub.be

The current discourse around mobility transition sits on a spectrum that stretches between decarbonization objectives and inclusionary agendas. As a result, scholarship has argued for a just and equitable transition towards low-carbon modes (Martens, 2017; Sheller, 2018; Schwanen, 2021). In this transition narrative, micromobility is promoted as a sustainable means of transport for short trips. Micromobility can be defined as a class of personal transport vehicles with limited speed, dimensions and capacity (International Transport Forum, 2020). Compared to carbon-based mobility, it offers public health benefits, a carbon emission and air pollution reduction, a potential redistribution of public space and advancements in liveability agendas in general (Cupples and Ridley, 2008; Pucher and Buehler, 2017). An equitable transition towards low-carbon mobility does not only rely on technical innovations, but also on shifts in socially constructed practices and representations (Glachant and Behrendt, 2024). Micromobility is framed and discursively constructed through media representation and communication by policymakers, lobby groups and other organisations. Popular media plays a significant role in presenting mobility transitions to a wider audience. In Flanders (Belgium), as well as in other urbanised parts of the Global North, the introduction of new forms of micromobility, including electrically assisted and shared ones, led to the formation of multiple narratives, either legitimising or delegitimising their existence and use (Petzer, Wieczorek and Verbong, 2020). This paper is therefore structured around three main research questions: 1) How is micromobility framed in popular media? 2) What main discursive narratives can be distinguished? 3) What differences between the narratives of different types of micromobility can be identified? To achieve this, a discourse analysis of articles from mainstream newspapers and media portals published in the Dutch speaking press in Belgium is performed using the Nexis Uni database (Hajer, van den

Brink and Metze, 2006; Fairclough, 2013). Articles published between January 2018 and December 2024 are considered because in this period, the rapid introduction of new shared micromobility agents and the growing market share for electrically assisted bicycles led to a spike in popular media coverage. All news outlets target to the Dutch speaking community in Belgium are taken into account to make sure contrasting ideological and political views are included in the analysis. The hypothesis is that e-scooters are perceived in a more negative light than regular bicycles, with a strong emphasis on safety concerns, both for users and their surroundings, as well as the impact on public spaces and the use of bike lanes. It appears that e-scooter users are less positively framed in the media compared to cyclists, which may lead to stricter regulation, reduced allocation of urban space for their use, or even the stigmatisation of their users.

Pedestrian-friendly cities are crucial for sustainable urban development, as they prioritise walkability through safe, accessible, and appealing environments that promote healthier lifestyles and reduce reliance on motorised transport. These cities enhance social cohesion, economic activity, and public health by fostering active transportation modes and creating more liveable neighbourhoods. Achieving these outcomes requires

a comprehensive understanding of pedestrian behaviour, including movement patterns and influencing factors. Pedestrian-oriented urban strategies contribute to improving health and safety by reducing vehicle-related accidents (Mendzina & Vugule, 2020a; Singhal, 2018; Varsha et al., 2023a), promoting social inclusion and equity (Eledeisy, 2023), and advancing sustainability by prioritising environmentally friendly transport modes (Handy, 2020). Increasingly, governments align these strategies with the Sustainable Development Goals (Singhal, 2018; Jeong et al., 2023; United Nations, n.d.) through effective policies that emphasise pedestrian mobility in public spaces (Reyes-Norambuena et al., 2024). In this context, data-driven analysis of pedestrian movement is vital for improving urban safety, planning, and economic performance, enabling resource prioritisation for impactful micro-level infrastructure improvements.

This paper directly addresses the critical gap in the current application of pedestrian data to strategically guide investment decisions in urban infrastructure. It investigates how data-driven insights can be effectively harnessed to prioritise resource allocation towards historically underserved areas, thereby promoting equity and fostering social justice. Specifically, this research tackles key questions, including: *How can granular pedestrian data be used to identify and prioritize areas requiring investment in pedestrian infrastructure? How can such data inform resource allocation decisions to maximise impact? And how well does existing pedestrian infrastructure currently align with observed usage patterns?* To address these pressing questions, this study leverages the power of integrated data analysis, combining pedestrian activity data gathered from Wi-Fi sensors with detailed geospatial data on existing pedestrian infrastructure within Loughborough town centre.

To gain a comprehensive understanding of the spatial dynamics of pedestrian movement and infrastructural needs, we classified our analysis into four distinct categories: *Underutilised Areas*, characterized by high pedestrian traffic coupled with inadequate infrastructure; *Neglected Areas*, demonstrating low pedestrian activity and a corresponding lack of suitable infrastructure; *Effective Support Zones*, exhibiting both high pedestrian traffic and robust, well-maintained infrastructure; and *Overburdened Areas*, struggling with high pedestrian volume that significantly outstrips the capacity of the existing infrastructure. This nuanced classification powerfully demonstrates the superiority of our data-driven analytical framework over traditional, less informed methods. By offering a precise and comprehensive evaluation of the relationship between pedestrian movement and infrastructural provision, this research reveals strategic opportunities to address spatial inequities and foster the creation of more inclusive and equitable urban environments. Specifically, the findings enable the development of targeted and evidence-based resource allocation plans to improve pedestrian infrastructure, focusing particular attention on underserved and overburdened areas. Ultimately, this data-driven approach promotes more equitable, sustainable, and pedestrian-friendly urban environments, leading to demonstrably fairer spatial outcomes and significantly enhanced urban planning decisions.

Urban Rail Transit Usage in Developing Countries: The Case of Istanbul

Author: Emine Yetiskul¹

Co-author: Metin Senbil²

¹ *Middle East Technical University*

² *Gazi University*

Corresponding Authors: yetiskul@metu.edu.tr, senbil@gazi.edu.tr

This study examines urban rail transit usage in Istanbul, offering critical insights into the challenges faced by developing countries in integrating transit infrastructure with rapid urbanization. Using regression models based on the node and place characteristics of rail stations (Bertolini, 1996), the research evaluates factors influencing passenger dynamics at rail stations between 2017 and 2022. Despite Istanbul's significant rail network expansion and public investment (Newman & Kenworthy, 2015), only a subset of stations exhibited concurrent increases in passenger usage and population. These findings reflect the need for tailored urban planning approaches in developing contexts. The study employs three models—the Node Model, Restricted Node-Place Model, and Node-Place Model—to analyze rail station performance using panel data. Key results demonstrate the importance of node characteristics, such as transfer opportunities, in determining passenger volumes. Stations offering multiple transfer options observed passenger numbers more than double the average, underlining the critical role of network integration. Conversely, place variables, including population density and employment within station catchment areas, displayed inconsistent significance. For example, in the Node-Place Model (2022), both population and employment variables showed positive associations with passenger volumes. However, across multiple time points, these variables failed to produce significant results in panel regression analyses. These outcomes suggest that while station characteristics are critical, other factors—such as socio-economic shifts, land-use changes, and urban dynamics—play a significant role in shaping transit usage (Cervero, 2013).

The study also uncovers differences in usage patterns between rail types. Marmaray suburban rail and light rail transit stations experienced 10% and 40% lower passenger volumes, respectively, compared to metro stations, reflecting disparities in service standards. Additionally, station proximity to city centers (as measured by the number of intermediate stations) significantly influenced passenger values, emphasizing the centrality of urban cores in transit dynamics. Interestingly, while Istanbul's rail investments have enhanced network accessibility, only 27 station areas (19.71%) showed simultaneous increases in population and passenger values during the study period. In contrast, over 65% of station areas experienced population declines, with a substantial number losing passengers as well.

The results highlight Istanbul's struggle to align its rapid "railization" (Gökçe, 2024) with broader urban transformation processes. Urban sprawl, accelerated motorization, and uneven land-use development further exacerbate these challenges (Gakenheimer, 1999). The findings suggest that stations in Istanbul are often treated as isolated nodes within the network, rather than integral components of the urban fabric. This approach limits their potential to drive sustainable urban development, as seen in other global examples of successful TOD, such as Bogotá and Curitiba (Cervero & Kockelman, 2008). The study underscores the need for a comprehensive planning approach that integrates rail transit with land use and urban development strategies (Bertolini et al., 2008). Rail

stations should not only facilitate mobility but also act as catalysts for sustainable, inclusive urban growth. Institutional inefficiencies, socio-economic inequities, and fragmented urban governance must be addressed to maximize the socio-economic and environmental benefits of rail investments. Policymakers are encouraged to adopt strategies that strengthen regulatory frameworks, promote equitable access to transit, and enhance station area development to foster vibrant, livable urban environments. Istanbul's experience offers valuable lessons for other developing cities, particularly those undergoing rapid urban transformation. The weak correlation between population changes and transit usage observed in this study reflects the complexity of urban dynamics in developing contexts. Future research should focus on unpacking these dynamics, exploring the role of factors such as institutional reforms in shaping transit behavior.

The study concludes that achieving this alignment requires a paradigm shift, where rail transit is not only planned as a transport mode but also as a critical driver of urban transformation.

Urban Canopy and Walking Behaviour

Author: Laia Mojica¹

Co-authors: Alexandra Bretones¹; Carme Miralles-Guasch¹

¹ *Universitat Autònoma de Barcelona*

Corresponding Authors: laia.mojica@uab.cat, carme.miralles@uab.cat, alexandra.bretones@uab.cat

Urban green spaces significantly influence walking behaviour, offering both physical and mental health benefits. However, existing research often relies on static, residence-based measures of green exposure, overlooking the dynamic nature of individuals' daily mobility patterns. This study addresses this gap by examining the relationship between green space exposure and walking behaviour, with a focus on capturing dynamic exposure using a case study in Granada, Spain. Granada's compact, historical urban form, characterized by narrow streets and limited large green areas, provides a unique context for exploring how distributed greenery affects mobility. Using GPS tracking and NDVI data, we analysed the movements and green exposure during 480 participated days. Results reveal notable discrepancies between residential and route-based green exposure, with residents of less vegetated neighbourhoods often encountering higher levels of greenery during their walking trips. Temporal analysis indicates greater exposure to green spaces on weekends, associated with leisure activities, while gender-specific patterns highlight differences in exposure types and routes.

Superblocks and Electoral Outcomes: Examining Local and Spatial Spillovers in Barcelona

Author: Jamie Orrego-Oñate¹

Co-author: Marta-Beatriz Fernández Núñez ¹

¹ *Universidad Autònoma de Barcelona*

Corresponding Authors: jaime.orrego@uab.cat, martabeatriz.fernandez@uab.cat

This study investigates whether the implementation of superblocks in Barcelona—a high-profile urban intervention aimed at improving environmental and social quality—has triggered an electoral backlash against the ruling party responsible for the intervention. Superblocks were progressively implemented between 2015 and 2019, with additional expansions in subsequent years, allowing us to test both the immediate and longer-term electoral impacts of this policy. Using data from municipal elections in 2015, 2019, and 2023, we employ a fixed-effects spatial panel regression model to estimate electoral outcomes across neighborhoods, explicitly accounting for time effects and spatial autocorrelation. This approach enables us to disentangle localized impacts of superblocks from broader temporal and spatial trends.

Our analysis focuses on whether residents directly living within superblock areas exhibited changes in their electoral support for the ruling party. Additionally, we examine potential spatial spillover effects—how neighboring areas, not directly treated with superblocks, may have been influenced by their proximity to these interventions. Preliminary results suggest that the direct effect of superblocks on electoral support is positive but moderate, indicating a slight increase in votes for the ruling party within superblock areas. The indirect effect, reflecting the influence on neighboring areas, appears larger in magnitude, pointing to a broader spatial diffusion of electoral support. While these effects suggest a localized and positive electoral benefit from superblocks, it is important to note that the ruling party's overall vote share has been declining since 2015, culminating in its loss in the 2023 election. This analysis attempts to disentangle whether superblocks contributed to increasing support in specific areas while other factors—likely more significant—reduced overall popularity citywide.

Interestingly, while the ruling party benefited from superblocks, other parties in the governing coalition did not experience significant changes in electoral support, suggesting that the observed effects are closely tied to the party most visibly associated with the policy. Furthermore, no significant impact was detected on the electoral outcomes of opposition parties, indicating that superblocks have not provoked widespread political polarization in these areas.

Barcelona's municipal elections operate under a proportional representation system, where votes are aggregated across the city to allocate council seats. This system provides a unique opportunity to analyze neighborhood-level variations while understanding their city-wide implications. By focusing on localized voting behavior, this study captures nuances in how urban policy interventions, like superblocks, shape political outcomes.

These findings highlight the complex interplay between urban policy interventions and electoral behavior. While superblocks appear to generate localized and spatially distributed electoral support for the ruling party, their overall influence remains modest relative to broader trends. Moreover, our analysis reveals that spatial spillovers may amplify the effects of such interventions beyond their immediate boundaries. However, these results should be interpreted with caution, as the direct and indirect effects observed in the model do not account for all potential determinants of voting behavior. In the short term, we aim to refine the model specification further, incorporate additional variables such as socioeconomic characteristics and accessibility measures, and conduct robustness checks to better understand these dynamics and present a more comprehensive analysis at the conference.

This study contributes to the broader literature on the political consequences of urban interventions and the role of spatial dynamics in shaping voter behavior. By leveraging a spatial panel regression approach over a multi-election timeframe, it offers a robust

framework for assessing how ambitious urban policies like superblocks influence electoral outcomes across both space and time.

TRANSPORT INFRASTRUCTURES, SHARED MOBILITY AND PUBLIC SPACES –THE URBAN DESIGN FOR MOBILITY HUBS

Author: Todor Stojanovski¹

¹ *KTH Royal Institute of Technology*

Corresponding Author: todor@kth.se

Many municipalities and public authorities seek to decarbonize transport and inspire a modal shift towards increased walking, cycling or public transport. However, the urban form poses a major obstacle. The sprawling highway infrastructure causes fragmentation of urban regions and wide roads act as barrier for pedestrians and cyclists. It is often impossible to walk, cycle or use public transport because of barrier effects caused by road infrastructure and neighbourhood design (Southworth, 2005). The problem of carbon-intensive car-oriented suburban developments can be addressed with combining mobility hubs and Transit-Oriented Development (TOD). TOD is an urban design alternative to transform car-oriented suburbs into walkable mixed-use neighborhoods that support public transport. Mobility hubs are new public spaces and transport infrastructure aiming to boost the accessibility (the so-called last mile) by offering on-demand mobility systems as shared bikes and electric cars at public transport stations and in surrounding neighbourhoods. Intelligent Transport Systems (ITS), Mobility as a Service (MaaS) and Intelligent Mobility (IM) links information technology with transport systems in various application areas: journey planning, sharing vehicles, smart parking, smart ticketing, etc. (Mulley et al., 2019). The mobility hubs seek to create a physical impact of on cities by materializing smart transport solutions as spaces on streets and in buildings, on sidewalks or parking lots. The cities responded by creating market packages for parking shared bikes, cars, scooters, etc. There is lots of research on implementation of carpools, shared bikes and shared electric cars under the MaaS paradigm (Hensher, et al., 2020), but few urban design studies of impact of mobility hubs and shared mobility systems on cities with morphological methods. The potential to implement and experiment with mobility hubs is high. Unlike TOD, that seeks to transform entire neighborhoods into transit-supportive walkable environments, the mobility hubs can be established as minor interventions as marking on sidewalks, at urban parking spaces and at suburban Park&Ride facilities that can be transformed into public spaces. Even though there is lots of focus on finding space on sidewalks or streets for shared bikes, cars, scooters, etc., the real potential lies in placemaking of suburban Park&Ride (facilities available for upgrading to mobility hubs). This is the motivation for TOD and mobility hubs urban design innovations and leitmotif to bring urban change and create social impact with mobility hubs.

The mobility hubs create a new buzz as future mobility infrastructure. But to inspire a major change in travel there is a need to create conditions for seamless transfer to shared mobilities based on urban experience of high-quality public spaces. Only with urban design at human scale and establishing mobility hubs as attractive public spaces it becomes possible to inspire higher use of shared mobility systems. This paper discusses how to strategically transform parking spaces and underutilized public spaces into working mobility hubs. It looks at experiments with mobility hubs in Germany, Sweden, France and USA to dissect the design elements of mobility hubs, by characterizing

and conceptualizing future public spaces with shared mobility systems. The methodology includes literature review, field observations of mobility hub experiments and mapping the urban design elements (e.g., bike pools on Figure 1 and carpools on Figure 2). The typologies of mobility hubs that will be abstracted based on observation study will be structured based on dimensions (in a context of placemaking see Nativade, 2022), diagrammatized and organized into design guidelines (see Stojanovski, 2020, for typological methodology of analyzing integration of public transport stops and morphological elements, including barrier effects, frontages and segregation from streets).

Proximity as a conceptual lens. The growing recognition of proximity planning

Author: Paola Pellegrini¹

¹ XJTLU - Xi'an Jiaotong-Liverpool University

Corresponding Author: paola.pellegrini@xjtlu.edu.cn

The concept of proximity can be a useful framework for interpreting and designing the urban environment. It aids in understanding spatial and social relationships while serving as a design tool to shape those interactions. This paper explores the resurgence of proximity in urban planning, offering insights for policymakers and designers.

The concept of proximity has gained international popularity recently with the '15-minute city' idea as a feasible and flexible solution for human well-being and effective climate action (Manzini, 2022). The recent COVID-19 crisis shed new light on the relevance of the concept which inspired numerous ideas of application. However, proximity is a fundamental concept in geography and urban studies and goes beyond easy access to various urban functions or the measure of distancing. The idea has old roots (Crawford, 2023) and evergreen Jacobs's and Gehl's seminal urban theories must be mentioned. Urban designers and planners may not explicitly use the term proximity-propinquity, but the concept is central to their work. In fact, it plays a role in shaping urban dynamics, influencing patterns of social interaction, organization, economic activity, and resource accessibility.

The growing recognition of proximity in urban planning as a key factor in creating livable and resilient cities is evident in some initiatives such as the Global Observatory of Sustainable Proximities, a capacity-building platform launched to support 'proximity' in urban planning supported by the UN (GOSP, 2025). The concept is, in fact, integral to the United Nations' strategies for achieving the Sustainable Development Goals, and is explicitly mentioned in SDG11 and SDG 9.

Despite its relevance and resurgence in practice, research on proximity planning has not kept pace with the increased recognition. The conceptual emphasis on proximity is rare. This contribution aims to foster a deeper understanding of the attention to proximity – more precisely to the group of concepts proximity, propinquity, intensity – in the planning discourse. In fact, the research hypothesis is that spatial proximity imposes itself prominently in new urbanization processes in developing countries and that proximity is back in the urban design-planning discourse in developed countries for the attention given to small dimensions, micro-mobility, polycentrism and compactness, intensification of uses (Cogato Lanza and Girot, 2014).

The study addresses proximity through three lenses: proximity as a social link; as shares spaces; as functional organization (Pellegrini, 2012). The study draws on key texts and different arguments, from Melvin Webber Order in Diversity: Community without Propinquity, 1963, to Barthes' Seminar Comment vivre ensemble at the Collège de France (1976-'77), to Neil Brenner's book New Urban Spaces. Urban theory and the scale question, 2019, which explores the relevance of socio-spatial interdependencies and inter-scalar framework. The paper discusses the concept and contributes to a deeper understanding of proximity's role in contemporary urban planning and its implications for sustainable development.

Socioeconomic Disparities in Daily Activity Spaces: Insights from Smartphone Mobility Data on Non-Commuting Trips

Author: Omer Dogan¹

Co-author: Sugie Lee ¹

¹ Hanyang University

Corresponding Authors: sugielee@hanyang.ac.kr, omerdogan1088@gmail.com

Urban mobility significantly shapes accessibility, equity, and social interaction in cities. While commuting patterns have been extensively studied, non-commuting mobility—such as travel for leisure, shopping, and social visits—remains underexplored despite its critical role in urban vibrancy and socioeconomic well-being. Socioeconomic status, including income, age, and gender, influences how individuals navigate urban spaces, and disparities in accessibility persist across demographic groups. Spatial inequities in non-commuting mobility can reinforce social exclusion and limit access to urban opportunities, particularly in a dense and complex city like Seoul. Existing research on urban mobility tends to prioritize commuting behaviors, overlooking the daily activity spaces that define the lived experience of different social groups. This study seeks to address this gap by examining how socioeconomic factors shape non-commuting mobility patterns in Seoul, focusing on activity space distance and destination diversity to provide insights into urban engagement beyond work-related travel.

Despite attention to mobility inequalities, there is limited research on how non-commuting mobility differs across income, age, and gender groups. Understanding who has greater access to mobility beyond work-related travel and which demographic groups face constraints in their daily movement remains an essential but insufficiently explored area of study. Additionally, previous research has largely overlooked the role of destination diversity in mobility studies, despite its implications for social interaction, economic opportunities, and urban vitality. A comprehensive understanding of activity space distance and destination diversity is crucial for identifying spatial inequities and formulating strategies for more inclusive urban mobility. This study aims to quantify the impact of socioeconomic factors on non-commuting mobility in Seoul by examining how income, age, and gender shape travel behavior across different time periods. Specifically, it investigates disparities in activity space distance and destination diversity among various socioeconomic groups and assesses whether lower-income individuals face mobility constraints that limit their access to diverse urban destinations.

Using large-scale mobility data from Seoul, this study uncovers significant socioeconomic disparities in non-commuting mobility patterns. Findings reveal that higher-income individuals tend to travel longer distances for leisure and social activities, whereas lower-income groups exhibit more constrained activity spaces, often limited to their immediate neighborhoods. These findings suggest that financial and time-related constraints may hinder lower-income individuals from accessing diverse urban destinations. Gender disparities are also evident, as women, particularly those in middle-age groups, demonstrate smaller activity spaces and lower destination diversity than men. This pattern may be attributed to safety concerns, caregiving responsibilities, or societal norms that shape women's mobility choices. Age also plays a significant role in mobility patterns; younger individuals exhibit greater destination diversity, suggesting higher spatial flexibility, whereas older adults have more restricted mobility and primarily visit familiar locations. These age-based differences raise concerns about accessibility in an aging society, emphasizing the need for age-friendly urban policies.

The results of this study highlight structural inequalities in urban mobility that limit access to economic, social, and recreational opportunities for disadvantaged groups. By shifting the focus from commuting to non-commuting travel patterns, this research contributes to a more comprehensive understanding of urban mobility experiences and the role of socioeconomic factors in shaping them. The introduction of activity space distance and destination diversity as key metrics offers a nuanced perspective on spatial inequities in Seoul. The study underscores the need for targeted policies to promote equitable access to urban resources, particularly for lower-income, female, and elderly populations. Addressing these disparities requires planners and policymakers to consider interventions such as improved public transportation accessibility, enhanced safety measures, and urban design strategies that foster mobility equity.

Evaluation of european tram systems: a GIS-based quantitative approach

Author: Michelangelo Fusi¹

¹ *Università degli Studi di Brescia*

Corresponding Author: michelangelo.fusi@unibs.it

Promoting public transport can significantly contribute to achieving climate neutrality goals, particularly in Europe, where 25% of CO₂ emissions originate from the transport sector (European Parliament, 2023). In order to move towards this direction, many European cities have equipped themselves with innovative public transport systems. These include the 'modern European tram' (Heipp & Wetzel, 2008), which is a contemporary reinterpretation of the 19th-century tram, and which remained the primary means of urban transport until the 1950s. In fact, in the post-war period, tram systems were gradually phased out in many cities due to their perceived obsolescence compared to the cars and buses (Petkov, 2020). However, since the 1980s, cities have re-introduced these means of transport on their streets with new criteria. This process, known as the 'tram renaissance', started in France and then spread across the entire European continent. The modern tram differs from the 'legacy' tram both in terms of its performance and the structuring role it can play in urban public space (Richer, 2016).

The tramway renaissance has aroused great interest in academic literature. Three distinct approaches to the topic can be identified. The first consists of the qualitative evaluation of (at least) two different case studies, located in different contexts, with the aim of comparing different legislation and design traditions (Richer & Hasiak, 2014). A second approach consists of the quantitative evaluation of one or more modern tram projects, with the aim of assessing their economic consequences (Knowles & Ferbrache, 2016). The third approach consists of the systematic cataloguing of quantitative and transport aspects of existing tram systems (UITP, 2019), possibly with a focus on modern trams (Spinosa, 2022). In addition, it is worth mentioning a strand of literature focusing on legacy trams, mainly located in Central and Eastern European cities. The focus of such studies ranges from understanding the impact on tram systems of different political regimes (Khairullina & Ganges, 2021) to assessing the feasibility of new systems by analysing existing systems (Kołos & Taczanowski 2016).

This paper proposes an alternative, GIS-based methodology. It is designed for the evaluation of tram systems intended not only as infrastructure or services, but as integrated systems that include both the components, as well their urban context. The method consists of four phases. In the first phase, existing literature was analysed to identify evaluation criteria and attributes. In the second phase, attributes were selected that could be measured quantitatively and calculated in a GIS environment, using open source datasets. These attributes were then categorised according to three criteria: people, places and nodes. In the third phase, tram systems were selected for analysis. In the fourth phase, based on the previously identified attributes, three indices were calculated for each criterion respectively, and calculated in GIS environment.

This method enabled a large-scale quantitative analysis of tram systems. All European systems were analysed, excluding the ones located in functional urban areas (FUA) with a metro system too. Furthermore, FUAs with more than 1,500,000 inhabitants were excluded. For these cases, future ad hoc research is proposed. The results were aggregated by country, making it possible to identify common patterns, such as the correlation between urban density and the distribution of tram lines. This study provides an original contribution to the body of research on the European tramway renaissance.

The expected results aim to support urban planners and decision-makers in optimising tram networks, with a focus on integration on urban context.

The operationalization and implementation potential of x-minute city policies across the globe: A review of the literature

Authors: Thiago Carvalho¹; Ahmed El-Geneidy¹

Co-authors: Steven Farber²; Kevin Manaugh¹

¹ *McGill University*

² *University of Toronto*

Corresponding Authors: steven.farber@utoronto.ca, kevin.manaugh@mcgill.ca, thiago.carvalhodosreissilveira@mail.mcgill.ca, ahmed.elgeneidy@mcgill.ca

X-minute city (XMC) policies represent a proximity-based planning approach designed to promote local living and active travel. These policies have gained significant attention in both research and practice, particularly since the mayor of Paris incorporated Carlos Moreno's 15-minute city framework into her 2020 re-election campaign. In this paper, we review thirty-seven studies that explore the potential of XMCs across the globe. Our analysis focuses on how the XMC concept has been operationalized in research, trends in implementation potential, and equity concerns related to these policies. Authors in our selection recognize the XMC framework as a "culmination" or a "heritage" of long-standing planning theories and practices, often linking it to concepts like Clarence Perry's Neighborhood Unit, the New Urbanist Movement, Jane Jacobs' ideas, and policies such as Portland's 20-minute neighbourhood strategy. To operationalize XMCs, researchers frequently develop assessment measures or indexes to evaluate the XMC potential of specific locations. This often involves using secondary data sources, such as local and

open-source databases, to identify the location of points of interest. From this data, cumulative or gravity-based accessibility measures are derived aiming to determine the percentage of the population located within x-minutes from specific amenity types or bundles. The choice of amenities defined as basic urban functions varies widely across studies and is highly dependent on data availability. Most studies prioritize destinations related to services, education, healthcare, and entertainment; categories initially proposed by Moreno. However, few studies have examined job accessibility within the XMC framework, often due to data limitations or the perception that work locations are a regional, rather than local, issue. Studies predominantly focus on walking, with relatively few addressing cycling, highlighting the research's strong emphasis on walkability. Furthermore, the literature suggests that especially in regions without a strong cycling culture, local living will be mostly constricted by what is achieved on foot offering a justification for its walkability focus. Studies in Europe and Asia tend to adopt shorter time thresholds compared to those in North America and Oceania. This difference reflects the challenges of implementing such policies in historically sprawled regions, where the inclusion of transit in the analyzed modes often becomes necessary. A recurring finding is that core central areas, especially in Asian and European cities, are more adapted to local living while lower accessibility levels are found in peripheral and low-income areas. Moreover, studies highlight the critical role of zoning laws in shaping accessibility, with mixed-use neighborhoods inducing shorter trips for the average person. Across all contexts, our review of the literature reinforces the need to not approach the XMC as a one-size-fits-all solution. XMC policies should be derived based on an understanding of local travel behavior and preferences, while considering inequalities of access and regional idiosyncrasies, especially in sprawled regions where a combination of local and regional planning approaches is needed to achieve XMC goals.

Reshaping Metropolitan TOD Corridor: The Impacts of Shanghai-Suzhou Intercity Rail Transit on Travel Behavior Along the Corridor

Authors: Huanghai Chen¹; Lei Xu²; Zhiwei Wang³

Co-author: Bing Liu ¹

¹ *Tongji University College of Architecture and Urban Planning*

² *Tongji University College of Architecture and Urban Planning, Shanghai Tongji Urban Planning and Design Research Institute Co., Ltd.*

³ *Tongji University College of Architecture and Urban Planning, Suzhou Planning and Design Research Institute Co., Ltd.*

In Metropolitan areas, the demand for high-frequency and high-time-value travel between megacity and its surrounding cities is continuously growing. In 2023, the commuting scale between Shanghai and its neighboring cities reached 155,000 people, with a growth rate exceeding 60% over five years. Due to its geographical location and economic industrial advantages, Suzhou has become the city most closely connected to Shanghai within the Shanghai metropolitan area.

In 2023, the opening of Suzhou's Rail Transit Line 11 and its seamless connection with Shanghai's rail transit network at Huaqiao Station introduced intercity rail transit in the urban area, providing new travel options for residents along the corridor and promoting a corridor growth model favorable to Transit-Oriented Development (TOD). This study

aims to explore the impact of the opening of intercity rail lines in the metropolitan area on residents' travel behavior and its mechanisms, and to analyze the transformation of various transportation modes and their connection with rail transit. The findings provide empirical evidence for strategies to promote multimodal transportation integration, reduce traffic carbon emissions, and strengthen TOD development along the corridor.

Based on an analysis of rail transit passenger volume, this study selected four representative stations for field research and conducted a questionnaire survey simultaneously. It analyzed the changes in travel characteristics of residents along the corridor before and after using rail transit. Utilizing the opening of the new line as a natural intervention, and to exclude the influence of other irrelevant factors, the study divided the research subjects into treatment and control groups based on the distance between passengers' origins and destinations and the rail stations. Applying the Difference-in-Differences (DID) method, the study quantified the differentiated impact of the opening of rail transit on residents' travel modes, frequency, and experience.

The findings indicate that following the opening of the new line, the travel activity of residents along the corridor significantly increased, with a strong positive correlation observed between travel frequency and satisfaction. The frequency of non-commute travel increased more prominently compared to commute travel, reflecting that the new line offers a more convenient transportation option for leisure and recreational activities, effectively stimulating the demand for non-commute travel. In terms of commute travel, residents exhibited a relatively higher tolerance for transfer distances. Residents demonstrated diverse choices in transfer modes, with variations in the selection of transfer modes across different time periods, and a relatively higher proportion of walking and cycling during peak hours. The new rail transit line significantly reduced the usage of private cars and taxis, with about 12% of former private car users switching to P+R (Park and Ride) or K+R (Bike and Ride) travel patterns. However, the impact of the new line on intercity rail and non-motorized travel was less pronounced.

This study reveals the significant impact of rail transit on changes in residents' travel behavior and its potential role in reshaping the Shanghai-Suzhou intercity TOD corridor. Rail transit has significantly promoted green travel in the areas along the corridor, effectively reducing traffic carbon emissions by decreasing the use of private cars and taxis. To further enhance the efficiency and service level of the entire transportation system, it is recommended to strengthen the coordinated development of transportation and land use, improve the public transit connection system, optimize the environment for walking and cycling, increase P+R facilities, and intensify the development of areas around stations along the corridor to enhance the passenger attraction capacity of intercity rail transit.

Shaping Pedestrian Mobility: Exploring Urban and Spatial Features of Cendere Valley, Kagithane

Authors: Turgay Kerem Koramaz¹; İlayda Kılıç Özokcu^{None}

¹ *Istanbul Technical University (Professor Doctor)*

Corresponding Authors: ilayda.kilic@yildiz.edu.tr, koramaz@itu.edu.tr

Livable cities, responding the needs of their citizens, should encourage social interaction, and consider environmental sustainability. In this context, walkability plays a critical role in the design of livable cities. While walkability refers to the physical, social and environmental features that enable pedestrian mobility and increase accessibility in cities, urban design includes spatial organization and planning processes to ensure walkability. Many

studies on walkability divide the basic parameters affecting walkability into two as the physical characteristics of the urban space (1) and the way it is perceived by individuals (2) (Alfonzo, 2005; Ewing and R., Handy, 2009). Then the literature address the spatial characteristics of urban design, while investigating the individuals' perceptions and walking behavior (Ewing and Handy (2009). In the literature, studies measuring, mapping or correlating walkability generally use the survey method to measure user perception and the index method to measure spatial characteristics (Fan et al., 2018; Ruiz-Padillo et al., 2018).

In Turkey, pedestrian mobility, in literature has mostly been addressed from the perspective of public space and accessibility (Ercan and Belge, 2017). Analyses of pedestrian GPS data and index values for various walkability criteria in literature focus on the examination of pedestrian mobility and spatial characteristics in Istanbul's urban macroform. Next to studies on perception and the physical characteristics of urban space, there are limited studies comparing these studies on the basis of index values based on certain standards. This study aims to quantitatively reveal pedestrian movements in urban open spaces through the physical characteristics of the urban space. The primary research question of this study is: How do the urban and spatial characteristics of open spaces shape pedestrian mobility? This question will be explored in the context of Cendere Valley, Kağıthane, where a walking path and open space arrangement have been implemented in an urban park scale. In this study, a holistic methodological approach is adopted to combine spatial and behavioral dimensions and to analyze the level of walkability, along the Kağıthane stream axis of Istanbul as the study area. Since there are different urban uses and transportation connections that affect the level of walkability in this axis, we basically examined the case area in three sub-zones to distinguish both spatial features and walkability measures.

The data to be used in the study were obtained from pedestrian counts in the site observations and published metrics, officially published by local authorities. The variables related to the spatial characteristics of the urban open space based on the quantitative metrics are obtained from Istanbul Metropolitan Municipality's open geodata portal. As fundamental findings of the study, spatial analysis is an important tool for understanding the effects of the spatial characteristics of urban open spaces on pedestrian mobility. The pedestrian density data obtained allowed the analysis of the behavior of individuals at different time periods and revealed how these behaviors are associated with spatial characteristics. By addressing the interactions between urban form and pedestrian mobility in a holistic manner, this study makes important contributions to the development of strategies to increase walkability in urban design processes.

Analysis of Regional Disparities in Public Transportation Accessibility: A Spatial Approach Based on Equal-Time Reachable Areas

Author: Kyubin Yoon¹

Co-author: Myonggu Kang¹

¹ *University of Seoul*

Corresponding Authors: mk@uos.ac.kr, peter3574@uos.ac.kr

Public transportation accessibility in modern cities significantly influences individual mobility efficiency and is a crucial factor in enhancing urban competitiveness and ensuring balanced regional development. However, disparities in accessibility persist across different areas, limiting mobility in regions with underdeveloped public transportation networks. This, in turn, restricts access to employment opportunities and educational services, exacerbating regional development inequalities and disparities in quality of life. Public transportation accessibility is particularly important as it offers a more cost-effective alternative to private vehicles and provides equitable mobility services across diverse social groups. Furthermore, it plays a vital role in shaping long-term urban development strategies.

To improve public transportation accessibility, an accurate assessment of the current level is essential. However, existing studies have primarily conducted analyses based on administrative boundaries, which include areas without residents or transit stops, thereby limiting the precision of accessibility evaluations. Additionally, most studies focus on specific metropolitan areas, making it difficult to compare accessibility levels across different regions within a country. Moreover, previous research often evaluates accessibility based on a single mode of transportation, lacking a comprehensive multimodal analysis.

To address these limitations, this study proposes a “travel time-based reachable area analysis” approach by integrating transit stops and actual residential areas within a 500m × 500m grid-based network in South Korea. This method visualizes the areas that users can realistically reach within a given time frame. Furthermore, the analysis is extended beyond grid units to administrative districts (“dong”) and incorporates data from all public transportation modes, including multimodal transfers. The study employs the following methodology:

First, establishing a 500m × 500m grid-based public transportation service area based on actual residential spaces rather than administrative boundaries.

Second, collecting and analyzing operational data from various transportation modes, including buses, trains, subways, aviation, and maritime transport, to assess interconnectivity, distances, and travel times.

Third, allocating public transportation stops to grid cells and identifying the range of reachable grids within a given time frame.

Last, comparing public transportation service coverage with regional population distributions to identify areas with insufficient transit services.

The analysis results indicate that the Seoul Metropolitan Area (SMA) possesses a more extensive transportation network than other regions. However, when considering service levels relative to population size, SMA exhibits relatively lower public transportation service availability. In contrast, regional cities demonstrate more localized mobility patterns centered around metropolitan hubs, with a narrower service range compared to SMA. Notably, certain areas exhibit disparities in public transportation accessibility relative to population density, highlighting regional imbalances.

The grid-based public transportation accessibility assessment proposed in this study enables a more realistic evaluation of mobility by focusing on actual residential areas. By analyzing reachable areas within the same travel time and incorporating population distribution, this approach facilitates the design of demand-responsive transportation services. Consequently, the findings of this study are expected to contribute to mitigating regional disparities in public transportation accessibility.

Study on Passenger Travel Characteristics in Rural Township Rail Transit of the Shanghai Metropolitan Area

Author: Yuchen Wang¹

Co-authors: Ge Chen¹; Jianzhong Huang¹

¹ *tongji university*

Corresponding Authors: 1670865568@qq.com, wyc04042022@163.com, huang03213@tongji.edu.cn

In recent years, the connectivity between key cities and adjacent municipalities within the Shanghai Metropolitan Area has intensified, rendering cross-regional commuting a prevalent occurrence. China has rapidly constructed Suburban Railways to satisfy the need for quick regional mobility. Unlike Japan Railways (JR) lines and Réseau Express Régional (RER) lines, China's Suburban Railway systems have not been standardized into a single format, incorporating both metro-style rural township rail transit and conventional Suburban Railways. Metro-style rural township rail transit, with shorter station spacing and faster speeds, is better suited to China's compact suburban urban layouts, making it an important form of transportation for promoting tight urban-rural integration and regional coordinated development. However, it is still unclear how best to construct suburban rail transit systems in terms of land use planning, spatial morphology, fundamental functionality, and integration with urban development.

With little focus on rural township rail transit, the majority of current research examines the features of passenger travel in urban rail transit systems. Furthermore, there are few studies that look at the whole travel chain of passengers in a single day, which obscures the complex links between travel behavior and spatial dynamics. Therefore, it has become imperative to define the different kinds of passengers and their patterns of behavior, as well as to optimize the functional layouts of facilities according to the needs of the local population.

This study focuses on rural township rail transit in the Shanghai Metropolitan Area, using Location-Based Services (LBS) data to create full daily trip activity chains of passengers. The study creates thorough passenger profiles for each age cohort by examining spatiotemporal behavioral features such as travel purpose, temporal patterns, transfer

modes, and activity areas across various age groups. Furthermore, the study investigates the composition and unique demands of passenger groups at distinct stations, categorizes station typologies, and develops focused methods for optimizing operational facilities.

This research not only fills the gap in rural township rail transit studies but also provides an in-depth analysis of diverse passenger travel characteristics and needs. The findings support the development of rational functional facility layouts around rural township rail transit stations, facilitate cross-regional and urban-rural mobility, and optimize the allocation of urban-rural resources and functional synergy. By leveraging the rural township rail transit network, this study further supports cross-regional activities, urban-rural interactions, and the optimization of regional functional structures. Ultimately, this study promotes the regional coordinated development of the Shanghai Metropolitan Area.

Exploring Pedestrian Comfort and Urban Mobility: A Multi-Modal Assessment of Walking Experiences at Popular Restaurant Destinations in Shanghai

Authors: Yutong Ma¹; Tongyu Sun²; Mengyue Mei¹

¹ College of Architecture and Urban Planning, Tongji University

² College of Architecture and Urban Planning, Tongji University

Corresponding Authors: mengyue_mei@163.com, 2210237@tongji.edu.cn, sty@tongji.edu.cn

Pedestrian comfort and mobility are crucial considerations in urban planning, particularly in densely populated megacities like Shanghai, where commercial districts serve as key hubs for pedestrian traffic. While existing research on walkability primarily focuses on broad urban metrics such as land use and pedestrian infrastructure, there is a noticeable gap in understanding how specific factors—such as pathway conditions, traffic flows, and environmental elements—affect pedestrian experiences in areas with high footfall. This study addresses this gap by examining pedestrian comfort and urban mobility in Shanghai's inner-ring commercial areas, specifically focusing on popular restaurant destinations, which attract significant pedestrian travel.

The research utilizes navigation data from *Gaode Map* to identify popular restaurant destinations within Shanghai's inner core, based on real-time popularity scores and number of navigation arrivals. Restaurants directly accessible from urban and community roads are selected for further analysis. The study then maps the transportation nodes within a 5-minute walking radius of each destination, categorizing them into four spatial access patterns: pedestrian, cycling, public transit, and vehicular. Empirical field observations are conducted to track actual travel behaviors, including the modes of transit and pedestrian arrival patterns.

A comprehensive pedestrian comfort audit is carried out, focusing on three key factors:

walking characteristics (speed, stride, and flow), traffic conditions (pedestrian-vehicle separation and congestion), and pathway quality (surface evenness, cleanliness, and overall maintenance). Additionally, the study integrates user-generated content from social media platforms *Xiaohongshu*, using sentiment analysis to assess public satisfaction with the walking experience. This dual approach—combining spatial audits with social media sentiment—offers a holistic view of the pedestrian experience at these popular restaurant destinations.

Preliminary findings highlight significant variations in pedestrian comfort across different transport nodes and pathways. Pathways connected to public transit and vehicular routes often face higher congestion, resulting in less comfortable walking conditions, particularly at busy intersections, overpasses, and congested corners. In contrast, destinations with dedicated pedestrian pathways and well-maintained surfaces provide more comfortable walking experiences. Environmental factors such as shading, cleanliness, and the presence of signage are also identified as important contributors to pedestrian comfort.

The findings of this study offer valuable insights for urban mobility and pedestrian-focused design. Recommendations for improving pedestrian comfort include enhanced pedestrian-vehicle separation and traffic spaces with barriers, better maintenance of walking surfaces, and the integration of urban design elements. This research presents an innovative approach to understanding pedestrian mobility by combining real-time navigation data, spatial audits, and sentiment analysis, providing actionable insights for urban planners and policymakers. Furthermore, the methodology offers potential for broader applications on creating pedestrian-friendly environments in dense urban areas like Shanghai, fostering comparative studies on pedestrian comfort and urban mobility globally.

Are Space Syntax and SNAMUTS a match made in heaven? How to combine accessibility tools of different scales and scopes to bridge conceptual gaps in planning practice

Author: Jan Scheurer¹

Co-author: Akkelies Van Nes²

¹ RMIT University

² Højskolen på Vestlandet

Corresponding Authors: akkelies.van.nes@hvl.no, jan.scheurer@rmit.edu.au

While Transit Oriented Development has been a long-standing paradigm in sustainable urbanism, there remains a common disconnect between the specific approaches of transit infrastructure and service planning on the one hand, and the internal design of local neighbourhoods on the other hand. This disconnect is partly owed to disciplinary barriers and the associated differing professional cultures, leading to an understanding of the initiatives of other disciplines as passive input rather than a call for open-ended, constructive collaboration. Accessibility tools have had some success in overcoming such incompatibilities in planning practice, yet they often originate within the thinking of particular disciplines themselves and subsequently focus on optimising outcomes specific to particular decision making tasks over others.

This contribution conducts an experiment to combine two contrasting accessibility tools representing different (if not unrelated) schools of thought and practice, and test their potential for common, synergistic applications. Space Syntax calculates the to- and

through-movement potentials of street and road network in built environments, thus measuring qualities such as spatial and functional integration of infrastructures at different scales including (but not limited to) the suitability of the public realm for active transport, while remaining largely silent on public transport (particularly off-street) and the distribution of land use activities. Spatial Network Analysis for Multimodal Urban Transport Systems (SNAMUTS) is a tool to analyse and visualise public transport network performance in relation to its land use context, taking a metropolitan or region-wide perspective down to the level of activity clusters, but providing insufficient geographical detail for relevant output at the pedestrian scale.

A combination of Space Syntax and SNAMUTS can help planners and decision makers better understand the interfaces of public transport and street-based accessibility in the context of promoting walkability, reducing car dependence and improving the wider economic benefits of urban investment. Alongside case study examples from Amsterdam, Auckland, Barcelona and Oslo, this paper demonstrates the added insight enabled by the co-application of both tools in terms of comparative accessibility performance between cities and over time, the discernment of spatial dynamics specific to each city, and how transdisciplinary policy making can capitalise on these.

Rail transit integration and land prices: Evidence from inter- and intra-city networks in the Yangtze River Delta, China

Author: Meiyu Zhang¹

Co-authors: Mi Diao ¹; Xueli Liu ¹

¹ CAUP, Tongji University, Shanghai 200092, China

Corresponding Authors: zmy138@tongji.edu.cn, diaomi@tongji.edu.cn, xueliliu@tongji.edu.cn

Over the past decades, China's rail transit systems have undergone rapid development, emerging as one of the largest networks globally in terms of operational length for both

inter- and intra-city rail systems. In recent years, China has implemented policies to enhance the integration of different types of rail transit, including high-speed railway (HSR), conventional railway, inter-city railway, suburban railway, and urban rail transit.

Rail transit, as a critical component of transportation infrastructure, enhances accessibility and fosters the development of surrounding areas. While most existing studies focus on the impact of a single type of rail transit developments—such as the opening of a high-speed railway line or the expansion of urban rail transit networks—less attention has been paid to the benefits of integrating different rail transit modes. For examples, Chang and Diao (2021) found that the opening of a new HSR line can increase the housing prices around metro stations connecting to the HSR station, while Liu et al. (2024) showed that connection to metro lines can promote the development of HSR station new towns. However, despite these findings, limited research has explored the causal impacts of rail transit integration on land prices, particularly from a regional perspective.

To fill this research gap, we assess the impact of rail transit integration on land value, using the inter- and intra-city rail networks in the Yangtze River Delta (YRD), China, as a case study. Our analysis focuses on a sample of 112 inter-city rail stations, including HSR stations, conventional railway stations, and inter-city railway stations, which were not connected to intra-city urban rail transit before 2014. We compile data on station characteristics, including station opening time, urban rail transit connection time, and station size, from the Baike (<https://baike.baidu.com/>), and collect land transaction information within a 5-km radius of these stations from 2014 to 2023 from the official website of China's Ministry of Natural Resources (<https://www.landchina.com/>).

Using a difference-in-differences modelling framework, we find that on average, integration with the intra-city urban rail transit has led to a 13.4% increase in land prices within the 5-km buffer of inter-city rail stations with urban rail transit connection relative to those without such connections. The integration effect varies by land use type with the residential land parcels experiencing a larger price appreciation than commercial land parcels after the integration. Spatially, the interaction effect also exhibits heterogeneity, with the highest appreciating rate observed in the 1.5-2.5 km buffer zone around rail stations.

This study offers a new perspective on the capitalization effect of rail transit development by focusing on network integration. The findings can provide useful insights to support the sustainable development of areas around rail transit stations.

The 15-minute city (15minC) model has emerged as a guiding framework for just and sustainable urban development, prioritizing proximity, connectivity, and diversity to enhance residents' quality of life. While widely applied in dense urban centers, its implementation in suburban areas faces particular challenges due to the lower density, insufficient connectivity, and limited diversity in the land use characteristics of such areas.

To reduce suburban distances, promote accessibility, and achieve the 15minC goals in peripheral regions, this research rethinks distance as a function of time, and proposes an approach that advocates for faster and more cost-effective solutions. The 15minC model often lacks actionable translation, as its guiding principles often remain aspirational and compass-driven rather than process-oriented, measurable, and applicable to planning documents and urban strategies.

Therefore, this study addresses these research gaps by defining a comprehensive set of Key Performance Indicators (KPIs) to explore the potential of digitalization and integrated multimodal mobility strategies as enablers of the 15minC principles in suburban contexts. Five diverse case studies are examined across six countries in Europe: Spain, Portugal, Hungary, Italy, Germany, and Turkey.

The study's methodology relies on key steps that include the identification of successful 15minC strategies, the assessment of available data sources for KPI measurement, and the primary definition of the set of KPIs. This is followed by conducting focus group workshops with local experts as a validation process, and sequentially by the refinement of the KPIs.

Preliminary findings suggest that while the KPIs provide a measurable framework for the 15minC, significant variations across case studies highlight the need for further refinement, additional data collection, and greater contextualisation in the next steps.

Accessibility to urban services by several transport modes using open data to operationalize the 15-min city concept

Author: Luis Encalada-Abarca¹

Co-authors: Ana Louro ¹; Eduarda Marques da Costa ¹; Nuno Marques da Costa ¹

¹ Centre of Geographical Studies, Institute of Geography and Spatial Planning, University of Lisbon, Portugal.

Corresponding Authors: nunocosta@edu.ulisboa.pt, eduarda.costa@edu.ulisboa.pt, analouro@edu.ulisboa.pt, luisencalada@campus.ul.pt

Recent studies have explored the "15-minute city" concept, which aims to provide essential urban services within a short distance of residents. Researchers have developed various methodologies to evaluate accessibility, including network-based frameworks

considering human mobility patterns (Zhang et al., 2022) and GIS-based approaches to measure proximity at the neighborhood level (Chiaradia et al., 2024). These studies have revealed disparities in accessibility between urban and suburban areas, as well as within a city (Akrami et al., 2024). The methodology of this study integrates open data, GIS-based tools and spatial analysis techniques to create accessibility indicators with the objective of evaluate access levels to urban services in five cities (Vienna, Lisbon, Munster, Groningen and Ankara), with the aim of operationalizing the “15-minute city” concept an assess accessibility to urban services. It focuses on measuring walking, cycling, and public transport proximity to four categories of amenities: healthcare, education, recreation and sport facilities, and retail and other services. Data collection and processing were structured around three main components: urban amenities, population data, and transport networks. Primary data sources include open platforms such as OpenStreetMap (OSM) and Google Maps, mapping approximately 27,000 points of interest. Population data from national statistical agencies were used to estimate populations served by amenities at fine spatial units, such as census blocks. Transport and road networks were derived from OSM, focusing on walkable streets, bike lanes, and public transport stops sourced from GTFS specifications. Moreover, the analytical model employs accessibility measures. Distance-based indicators calculate the percentage of the population with access to at least one amenity within 15 minutes. Diversity and density metrics are also included, assessing the variety of services available within specific areas. The analytical framework comprises several steps: defining origin units (residences), selecting target amenities, and applying average travel speeds (e.g., 4-5 km/h for walking and 13 km/h for cycling). Road networks simulate real-world conditions using network distances, ensuring higher accuracy. Amenities were categorized into four main types, enabling direct comparisons across cities. The methodological findings demonstrate that using open data is effective in producing replicable accessibility measures. Integrating detailed population data with urban networks provides granular insights for policy-making. The methodology also allows to identify significant inequalities in cities with low density and peri-urban development. The proposed approach can be applied in future studies to compare accessibility in urban areas and foster solutions for active and inclusive mobility.

Performance Analysis of 15-Minute City Zones Through Spatial and Machine Learning Techniques

Authors: Aydın Furkan Terzi¹; Ayşenur Koçyiğit¹; Koray Aksu¹; Hande Demirel¹

¹ *Istanbul Technical University*

Corresponding Authors: kocyigit19@itu.edu.tr, hande.demirel@itu.edu.tr, terzia18@itu.edu.tr, aksuko@itu.edu.tr

With the significant growth of urban populations, cities are expanding rapidly, making urban sprawl a critical global challenge that necessitates urgent attention in policy agendas. This trend leads to various negative outcomes, such as increased energy consumption from a heightened reliance on automobiles, elevated levels of air and water pollution, and severe traffic congestion that hinders mobility. The environmental affects are also significant, as ecological disruption frequently endangers local ecosystems and biodiversity. Therefore, addressing these interconnected issues is vital for fostering sustainable urban development and enhancing the quality of life for urban residents. In light of these challenges, Professor Carlos Moreno introduced the innovative urban planning concept known as the 15-Minute City in 2016, designed to address these concerns. The 15-Minute City aims to foster sustainable neighborhoods, allowing residents to conveniently access essential services and facilities within a 15-minute walk or other sustainable transportation modes from their homes. This idea is rooted in chrono-urbanism, which argues that the quality of urban life declines as the time and financial resources devoted to transportation increase (Moreno et al., 2016; Moreno et al., 2021). The adoption of this concept is projected to lead to improvements in transportation efficiency, a reduction in pollution generated by automobiles, and a significant transformation of urban environments (Olivari et al., 2023). The 15-Minute City concept, has garnered considerable attention from scholars, and its definition and scope have continued to evolve. Cities in Europe and Asia, which generally feature higher population densities, are more likely to adopt the 15-Minute City model. In contrast, urban areas in the United States and Australia often implement the 20-Minute City concept due to their lower suburban densities (Staricco, 2022). Furthermore, there are various time-based urban models, such as the 1-Minute City in Stockholm, the 5-Minute City in Barcelona, and the 30-Minute City in Sydney (Pinto and Akhavan, 2021). These varied concepts highlight a range of methodologies for characterizing urban environments under Moreno's innovative framework. All share a common objective: to create sustainable and accessible urban spaces based on the principle of hyper-proximity, which asserts that basic necessities should be reachable within a specified travel time from an individual's location (Logan et al., 2022).

This study employs spatial analyses within a GIS framework, incorporating machine learning algorithms to evaluate the effectiveness of potential 15-Minute City zones in a specific district. A machine learning algorithm, such as DBSCAN, is used during the neighborhood selection process to accurately represent building density. Eleven categories are identified to generate performance metrics: education, food, daily essentials, public spaces, small industrial areas, cultural facilities, healthcare services, social infrastructure, community services, commerce and economy, and transportation. The significance of these categories is assessed using the entropy weight method. The study area is organized into grids, which will be tested for their shapes and dimensions to accurately represent land cover/ land use. Additionally, a digital elevation model will be utilized to assess walkability. The performance values for each zone will be evaluated based on established categories, using objective weighting methods to ensure a thorough analysis. These concepts will be applied in the Küçükçekmece district of İstanbul, Türkiye due to the engagement of this district in 15-Minute City projects. By employing robust techniques and high-granularity data from reputable open-access sources, this research will help rank potential neighborhoods for a 15-Minute City within the selected district.

The accessibility of social housing units: An analysis of location and policy in Flanders (Belgium)

Author: Lisa Cochez¹

Co-authors: Eva Van Eenoo¹; Nele Aernouts¹; Kobe Boussauw¹

¹ *Vrije Universiteit Brussel*

Corresponding Authors: nele.aernouts@vub.be, kobe.boussauw@vub.be, lisa.cochez@vub.be, eva.van.eenoo@vub.be

Social housing is a crucial lever for breaking the cycle of structural poverty, although its effectiveness can vary depending on the location. Nevertheless, the accessibility of social housing, essential for reducing mobility-related exclusion, is an underexplored topic and thus far, the relationship between accessibility of social housing and mobility-related social exclusion is poorly understood. Accessibility in this context refers to the extent to which residents have access to various destinations such as jobs, schools, shops and other amenities. A lack of accessibility could partly cancel out the material benefits of social housing for social tenants in the form of decreased social and economic participation.

Using Flanders (Belgium) as a case study, we employ a set of proximity and mobility indicators to analyse the accessibility of the current social housing stock in relation to public transport, amenities and employment. In addition, by means of interviews with key stakeholders, we examine how the accessibility of social housing is currently addressed at the policy level.

The accessibility analysis indicates that social housing tends to be situated in central locations, achieving relatively high accessibility scores. However, this is not the case for all projects. We can distinguish locations with limited accessibility, while we also identify areas that are particularly favourable from an accessibility perspective, but where the number of social housing units is low. The interviews suggest that accessibility does not currently play a central role in Flemish social housing policy and is not systematically considered when housing authorities select new development sites. We conclude that systematic mapping of social housing accessibility can provide new insights on the opportunities and constraints associated with the location of social housing. In conclusion, we recommend a more structural integration of accessibility in social housing policy, taking the needs and wants of social tenants as a starting point.

Sustainable Urban Mobility Plans: a catalyst for transformative urban practices?

Author: Elisabetta Vitale Brovarone^{None}

Co-authors: Aida Shaneh¹; Francesca Blanc²; Giulia Melis²

¹ *Politecnico di Torino*

² *Links Foundation*

Corresponding Authors: francesca.blanc@linksfoundation.com, aida.shaneh@polito.it, elisabetta.vitale@polito.it, giulia.melis@linksfoundation.com

Sustainable Urban Mobility Plans (SUMP) are strategic planning tools designed to satisfy mobility needs in cities and their surroundings for a better quality of life. According to the European Commission, “A SUMP offers a comprehensive, vision-led, flexible and resilient approach by serving as a long-term mobility plan that includes packages of measures addressing short-term objectives and targets the reaching of which can be fast-tracked in response to changing needs.”(EUR-Lex - 32023H0550 -EN). However, the capacity of SUMP and other similar mobility planning instruments in bringing about effective changes towards more sustainable and just mobility practices has been questioned (Maltese, Gatta and Marcucci, 2021; Wågsæther et al., 2022; Hidayati and Tan, 2025). Aiming to shed light on the matter, this paper comparatively examines the multilevel governance framework of sustainable urban mobility planning across Europe, through the analysis of 8 case studies from the JUST STREETS project. We start from the assumption that in order to understand the effectiveness of SUMP it is necessary to consider them as part of a spatial governance and planning system (SGPS), i.e. a complex and multidimensional interaction among the urban legal framework (i.e. structure), the tools for spatial planning (among which the SUMP), the practices, and the discourses built around them (Berisha et al., 2021). This interaction shapes and determines the possibility for SUMP to improve urban mobility towards more sustainable and just mobility practices. By combining literature, policy and document analysis, the paper reviews the multilevel frameworks in which SUMP are developed and implemented, from the European to the local scale. First, the interaction between the urban legal framework (structure) and the SUMP (tools) is inquired. Then, the lens is brought closer to practices, focusing on one local case study from the JUST STREETS project. The mutual interactions between the SUMP, emerging sustainable and just mobility practices, and rising discourses on sustainable and just urban mobility is carried out. Overall, the paper sheds light on the possibility of SUMP as a catalyst for transformative practices (Albrechts, 2017) actually contributing to mobility justice, and the room for improvement in this respect.

T_03 MOBILITY (B) / 1487**Beyond the Access: Structural Vulnerabilities and Spatial Equity in a Multimodal Public Transport Network****Author:** Jeon Baekchan¹**Co-author:** Kang Myoung-Gu¹¹ *University of Seoul***Corresponding Authors:** sarakael0602@uos.ac.kr, mk@uos.ac.kr

Modern public transport networks (PTNs) are not simply physical conduits for movement; they are vital infrastructures that shape socio-economic opportunities and influence the quality of urban life. Despite this significance, notable service gaps still exist between urban centers and peripheral or rural regions, which in turn intensify socio-economic inequalities, limit access to essential opportunities, and risk disrupting balanced regional development. Conventional studies based on OD (Origin-Destination) data or those that focus solely on physical connectivity cannot fully capture the actual service gaps emerging in multimodal PTNs, where rail, bus, air, and sea transport all operate concurrently. Furthermore, analytical approaches that rely on administrative boundaries often fail to account for diverse geographical and socio-economic contexts, making meaningful comparisons across areas of varying size and jurisdiction problematic.

In response to these shortcomings, this study proposes an “operational capacity-based multiplex network analysis” that models a nationwide multimodal PTN using 500 m × 500 m grid cells in which people actually reside and utilize public transport services, rather than arbitrary administrative units or individual station points. Through the concept of “connectivity strength,” which integrates both service frequency and transport capacity, the approach moves beyond the traditional notion of accessibility to more accurately capture the actual level of service experienced by users. Building on this framework, a nationwide PTN network was constructed in GTFS format (TMAP data) for rail, bus, air, and sea modes, enabling complex intermodal interactions to be assessed from the perspective of actual user transfers. Long-distance (inter-city) and short-distance (intra-city) travel were distinguished in order to calculate key graph-theoretic indicators such as centrality, connectivity, and accessibility, revealing structural vulnerabilities in different regions and transport modes. Socio-economic data, including population, employment, and POIs, were then integrated to identify service imbalances that remain invisible under a purely physical connectivity lens. Finally, a comparison between a “Level 1” physical network and a “Level 2” operational capacity-based network revealed low-frequency or low-capacity areas struggling with significant service shortfalls, leading to the derivation of a composite vulnerability index via TOPSIS and the identification of priority areas for improvements and investments.

The results showed that many areas perceived as physically well-connected suffered severe service vulnerabilities due to limited capacities and low service frequencies. This finding suggests that OD-based or simple connectivity-centric PTN planning alone may not effectively safeguard mobility equity or balanced development. By contrast, the proposed “service-oriented” multiplex approach highlights structural gaps rooted in heavy reliance on specific rural segments or transfer hubs, indicating potential routes for innovative policymaking in multimodal public transport. Moreover, this data-driven framework furnishes practical insights into promoting balanced regional growth and improving mobility equity, while offering valuable guidance for strategic enhancements of public transport services. It also holds promise for broader application in user-centric, service-focused PTN planning and assessment models in the future.

Do similar social groups have similar mobility in a city? Social areas and mobility in Shenzhen, China

Author: Run Shi¹

¹ *Guangzhou Institute of Geography*

Corresponding Author: rainie.sh@foxmail.com

Social area analysis has been applied to analyze how urban space is spatially arranged. Related studies have divided urban residents into different groups whose socioeconomic status are similar. However, few studies have attempted to explore the mobility of these social groups, especially for developing countries where census data with travel information are not readily available. This study explores whether people in the same social area have similar work mobility and whether location matters from an aggregated neighborhood perspective. A case study is conducted in Shenzhen, China with fine-grained census and mobile phone data. The neighborhood committee based census and cell tower based mobile phone data are integrated into 500 m grid for analysis. Results show that different social areas have significantly different work mobility, and the within-group heterogeneity is also prominent. Three location factors are examined and it is found that there exist variations in the influence of spatial factors on work mobility for different social areas. Findings of this study will supplement current knowledge about social areas, location and mobility in urban China at the mesoscale. In addition, the methodology provides a feasible framework of integrating city-scale socioeconomic information and mobility data from different sources for future urban studies.

Travel Characteristic of Elderly People in Towns of Shanghai Metropolitan Area: An Urban-Rural Mobility Network Analysis

Author: Ge Wan¹

Co-author: Jianzhong Huang¹

¹ College of Architecture and Urban Planning (CAUP), Tongji University, Shanghai, China

Corresponding Authors: 2210273@tongji.edu.cn, huang03213@tongji.edu.cn

With the worsening of low fertility and ageing in China, the proportion of elderly people is gradually increasing, and the government is placing greater emphasis on addressing the social needs of the elderly. In the Shanghai metropolitan area, Shanghai is the first city in China to experience population ageing, with the highest degree. Some cities, such as Nantong, have also entered a severely ageing society. The travel needs of the elderly are increasing, so building an age-friendly and inclusive society has become a key focus in urban planning.

Current research on the travel behaviour characteristics of elderly people mostly concentrated in cities, with less attention paid to rural elderly people. In towns that serve as a link between urban and rural areas, due to the frequent out-migration of young labour forces, there is a large number of elderly people left behind. The elderly in these areas face more complex geographical, social and transportation conditions when travelling. Compared with cities that are rich in various resources, the elderly in towns deserve more attention, which is also an aspect that should be taken into account in building an inclusive society. With the development of mobile signalling data, it has become possible to analyze the travel characteristics of rural elderly people, which also provides a basis for the government to allocate urban and rural resources and build elderly-friendly towns rationally.

This study employed network analysis methods, integrating mobile signalling and traffic travel survey data. By constructing urban-rural and rural-rural population mobility networks, it deeply explored the spatial distribution characteristics of the travel frequency, distance, duration, and destinations of the elderly aged 65 and above in rural areas during their daily lives. It also investigated the relationship between these features and towns' economic and social development and summarised the main influencing factors. The research found that the elderly's travel mainly focuses on short-distance and regular daily life needs, such as medical visits, shopping, and visiting family and friends. In towns, elderly people's mobility is more limited, with a small travel radius and low frequency. However, for some elderly people with specific medical needs or whose children live in urban areas, the frequency of cross-regional travel has increased. In terms of travel modes, rural elderly people generally rely on public transportation, with less use of private cars, and this is closely related to their age and health conditions. Regarding influencing factors, this study analyzed the impact of economic conditions, transportation facilities, and social support on the travel of the elderly. In towns with higher economic levels, the travel frequency and range of the elderly are relatively larger. However, elderly people in less developed towns face problems such as inconvenient transportation and limited medical resources, which makes their travel more dependent on social support and family care. The differences in travel patterns among different towns also reflect the quality of life gap among the elderly in different regions and suggest that in future urban planning, more attention should be paid to the travel needs of the elderly in towns and the areas at the urban-rural interface.

This study provides a clearer understanding of the spatial mobility and cross-regional interaction of elderly people's travel, revealing the special needs and behavioural patterns of the elderly group in towns. The travel characteristics of elderly people in towns are influenced by multiple factors and show complex spatial distribution and social network effects. In the future, the government should carry out differentiated planning according to the characteristics of the elderly groups in different regions to build an inclusive society and cope with the challenges of ageing.

The Suburban Transformation: Rethinking Post-Pandemic Urban Futures

Author: Khaled Alawadi¹

Co-author: Abrar Aletaywi²

¹ Associate Professor

² Khalifa University

Corresponding Authors: khaled.alawadi@gmail.com, 100059705@ku.ac.ae

The COVID-19 pandemic has been a critical juncture for the fields of urban planning, urban design, and transportation studies. There has been an increase in active modes of travel such as walking and cycling, especially amongst people who previously relied on private vehicles and public transportation (Rice, 2020). A renewed dialogue has begun about what post-pandemic cities should look like. The ongoing COVID-19 pandemic has disrupted all aspects of human life and affected a variety of disciplines, including urban planning and design. The pandemic is touted as an opportunity to rethink neighborhood design and has raised challenging questions for planners and policymakers about the issues of density and mobility (de Rosa & Mannarini, 2021). There is an urgent need to design cities that accommodate pandemic-control measures while attending to people's daily needs, including access to outdoor spaces for physical, social, and mental well-being. These requirements for post-pandemic cities have positioned suburbs as a more attractive and viable alternative than compact urban areas. However, the conventional suburban model of low-density, automobile-centric development with fragmented streets cannot maintain high levels of accessibility within neighborhoods. This study offers an alternative, evidence-based suburban design model for post-pandemic cities. Quantitative examinations of case studies in Dubai and Abu Dhabi, along with illustrations of potential redesign options, show how suburbs can be made more accessible to pedestrian traffic.

The study provides a new approach to suburban studies that combines morphological mapping, network analysis, and quantified renewed scenarios for future suburban design. Morphological mapping and network analysis diagnose the accessibility levels in a variety of suburban samples. The redesigned or renewed suburban scenarios are then developed based on the lessons and quantified outcomes learned from the highly accessible suburban samples. This investigation is relevant for urban planning and design scholarship because it contributes to the evolving literature that depicts suburbs as a potent ground for innovation, rather than demonizing them. This approach or process of inquiry can be applied to urban areas worldwide to study the performance of built forms with the aim of retrofitting existing fabrics or redesigning new ones.

Modelling Tailpipe Emissions: Assessing vulnerability of emissions with a planning perspective

Author: Ahsan Habib¹

Co-author: Shane Blundon²

¹ *Dalhousie University*

² *Dalhousie university*

Corresponding Authors: sh601868@dal.ca, ahsan.habib@dal.ca

This study explores the exposure to vehicular emissions in relation to social vulnerability. It takes a disaggregate, activity-based modelling approach to estimate tailpipe emissions at the road network level. The vulnerability index was derived based on socioeconomic information from census tabulations. It is necessary to investigate the exposure of harmful emissions on vulnerable populations as they are often susceptible to chronic health impacts, creating environmental justice issues (Molchan et al., 2024). Emissions are not equally dispersed and may impact people who may not be emitting them. Therefore, this study estimates tailpipe emissions and a vulnerability index to develop an emissions vulnerability assessment for Halifax Regional Municipality (HRM) in Nova Scotia, Canada. The activity-based travel model was developed utilizing the 2022 Halifax Travel Activity Survey. The model consists of four segments: 1) Population synthesis, 2) Activity generation and scheduling, 3) Vehicle allocation and mobility assignment, and 4) Traffic and emission estimation. Greenhouse gas emission (GHG) is used as a proxy to understand exposure to vehicular emissions. The vulnerability index begins with a principal component analysis (PCA) to identify relative importance of socioeconomic attributes of individuals at the zonal level. In total, twelve attributes were considered in the development of a social vulnerability index (SoVI), focusing on four thematic areas: 1) Diversity and housing suitability, 2) Socioeconomic and mobility patterns, 3) Demography, and 4) Economic challenges. The resulting SoVI of different zones in HRM were overlayed with the vehicular emissions by utilising GIS analysis. It assesses emission vulnerabilities by classifying both vulnerability and emissions based on percentiles.

This paper identifies vulnerable areas to tailpipe emissions. The result of the SoVI shows that many of the lower income zones experience higher levels of emissions, particularly in the downtown areas. For instance, a Northern portion of Halifax exhibited the high score of 2.1. Interestingly, Halifax South end, which is adjacent to Halifax's North end, also showed a high score of 2.0, despite being considered a high-income area. In general, tailpipe emissions are highest in urban areas, followed by suburban and rural zones. Similarly, the variability of vulnerability index is highest in urban areas, while decreasing in suburban and rural zones. This correlation underscores the greater significance of vulnerability to tailpipe emissions in the urban zones within the cities of Halifax and Dartmouth.

This provides valuable insights to identify vulnerable populations that are exposed to tailpipe emissions. This study offers important policy guidelines including reduction of vehicular activity in the downtown core by diversifying public transportation. The study also reveals environmental justice issues in Canadian cities that require further climate action to reduce the impact of over-reliance on private vehicles. Such transport policies will help Canadian governments and organizations to reduce their tailpipe emission levels for vulnerable populations and aim to achieve net-zero by 2050.

Cities worldwide are embracing ambitious mobility transformation policies aimed at reshaping built environments to prioritize walkability, cyclability, and overall livability. These initiatives are part of a broader urban planning paradigm shift that seeks to reclaim space from cars and return it to pedestrians and cyclists. Policies such as 15-minute cities (Papadopoulos et al., 2023), Low-Traffic Neighborhoods (Aldred et al., 2021), and woonerfs (Cekrezi, 2022) exemplify this trend. By designing environments that reduce travel distances and support active transportation, these policies aim to address environmental challenges, enhance health outcomes, and foster social equity (Proffitt et al., 2019).

Despite their potential to create healthier, more equitable urban spaces, the success of these policies depends heavily on public acceptability. While their environmental and social benefits are well-documented—including reductions in energy consumption and emissions and enhanced transportation equity and justice—their acceptability remains underexplored. Nevertheless, understanding public perceptions is crucial, as resistance to these policies can lead to organized opposition, jeopardizing their implementation and sustainability (Marquet et al., 2024). Academic literature has so far found that the acceptability of these policies is influenced by the projection of future changes that will endure in the mobility habits of individuals. Rahman & Sciara, 2022 found that those policies that lead to forced and unwanted mobility changes to individuals can trigger resistance, and the opposite holds true -policies that align with citizen's desired behaviors garner more support-

This study focuses on the acceptability of Barcelona's key mobility transformation policies: Superblocks, School Streets, Bicycle Lanes, and Pedestrianizations. By examining multiple policies within a single urban context, this research provides a nuanced understanding of the dynamics underlying public acceptability and opposition. This approach is critical, as the literature has, until today, focused on analyzing the acceptability of single-issue policies, such as congestion charges, low-emission zones, or parking management.

The research employs a comprehensive survey targeting 2,000 Barcelona residents to investigate demographic, ideological, and experiential factors influencing public attitudes toward these policies. The survey examines variables such as perceived efficacy, distributional and procedural fairness, political trust, and projected impacts on personal mobility habits. Respondents' willingness to support policy extensions, their trust in local governance, and their views on the equity of policy outcomes are also analyzed.

This study's findings will help us test for the first time whether certain sociodemographic and ideological characteristics influence public support or resistance to urban mobility transformation policies. Additionally, we will be able to assess whether individual values and norms play any role in shaping public perceptions of these policies. By addressing these factors, the study seeks to help policymakers avoid costly trial-and-error approaches, ensuring the alignment of mobility transformation policies with public

needs and expectations.

Ultimately, this research highlights the importance of integrating public perceptions into the design and implementation of mobility policies, fostering inclusive and sustainable urban environments. It emphasizes the role of urban mobility transformations in addressing climate challenges, promoting equity, and ensuring resilience in urban systems. By advancing our understanding of public attitudes toward transformative urban planning, this work supports the development of just, safe, and accessible mobility systems critical to sustainable urban futures.

Sustainable mobility and Consolidated City. Urban Regeneration strategies for the Metropolitan City of Rome

Authors: Irene Poli¹; Enrico Losardo¹

¹ *Department of Planning, Design and Architectural Technology - Sapienza University of Rome*

Corresponding Authors: irene.poli@uniroma1.it, enrico.losardo@uniroma1.it

The critical role of cities in addressing the global climate crisis is increasingly acknowledged. The European Union (EU), one of the most urbanized regions globally, has placed urban issues at the core of its political agenda, in line with the UN Sustainable Development Goals (SDGs), as evidenced by numerous measures aimed at fostering sustainable development, such as the Leipzig charter (2007), The Urbana Agenda for the EU (2016) or the European Green Deal (2020). These international initiatives consistently identify mobility as a central issue for sustainable development, emphasizing both improved accessibility and reduced environmental impact. Confirming this awareness, the EU introduced a new strategic plan in 2009 at an inter-municipal scale, the Sustainable Urban Mobility Plan (SUMP) (COM 2009/490). This planning device, designed for a medium- to long-term implementation, aims to achieve social-economic and environmental sustainability objectives, highlighting the role of mobility in the context of the existing city as a tool to counter marginality.

This research examines urban regeneration by focusing on the strategic role of sustainable mobility within the consolidated city, defined as the urbanized territory shaped by 20th-century planning, characterized by a compact urban structure and limited public spaces and services (Garano, 2001). The significance of this portion of urbanized territory is underlined by its size, and the enormous building and housing density that characterizes it. In Italy, these strategic areas emerged during the rapid post-war growth period until the early 1980s, and now face challenges due to their original car-dependent development model. This issue is further exacerbated by the unique “genetic anomaly” of Italian cities, where industrial growth was not matched by the development of extensive rail networks (Campos Venuti, 2001).

The aim of this paper is to identify theoretical, methodological, and operational references for an innovative planning system which, through the implementation of public transport networks, can trigger regeneration processes within the consolidated city. A case study of Rome explores the interplay between the pilot project “15 Projects for the 15-Minute City,” inspired by Carlos Moreno’s model that prioritizes service accessibility and proximity (Moreno, 2024), and the mobility forecasts of the new metropolitan SUMP (approved December 2024). The latter renews and extends the ambitions of the current city’s regulatory planning (NPRG, 2008), seeking to enhance mass public transport offer through a ‘rail therapy’ identified as ‘the condition’ for implementing the city’s development strategies, based on a polycentric model (Marcelloni, 2003; Ricci, 2009).

The methodology is structured in three phases:

1. Contextualization: A diachronic analysis of the formation processes of the consolidated city in relation to mobility infrastructure development, alongside a review of the regulatory framework.
2. Case Study Analysis: An examination of Rome’s mobility plans and urban regeneration projects to inductively identify innovative strategies, tools, and guidelines for transforming the consolidated city, including synergies with other planning devices and resource transposition strategies.
3. Systematization: The development of a flexible framework that organizes the identified strategies into coherent modalities for governing sustainable mobility interventions.

The proposed framework aims to integrate planning instruments at different scales, within a strategic/structural planning system that envisions potential implementations with coherence-based guidelines and structural invariants of planning at different scales serving as a coherence framework for transformations in the existing city, capable of enabling access to different funding channels (Galuzzi and Vitillo, 2018).

Ultimately, the research underscores the central role of sustainable mobility in regenerating the consolidated city, arguing that mobility planning must form the backbone, within the broader conception of the Public City as a reference matrix for urban sustainability, of transformative processes aimed at rebalancing spatial inequalities (Oliva and Ricci, 2017).

T.03 MOBILITY (B) / 1318**Planning amidst Planetary Crisis: Rethinking Theory and Practice through Adaptive Transformations in Public Transit****Authors:** Yanyun MAO¹; Jian ZHUO²¹ *Urban Mobility Institute, Tongji University*² *Urban Mobility Institute & College of Architecture and Urban Planning, Tongji University***Corresponding Authors:** jian.zhuo@tongji.edu.cn, yanyunmao@tongji.edu.cn

The global crises of climate change, resource scarcity, and public health have profoundly reshaped the operational logic of urban spaces and the spatiotemporal patterns of transportation networks. Urban mobility systems must not only adhere to sustainability goals but also enhance resilience to uncertainty. In China, severe mismatches in the supply and demand of public transportation persist, as conventional planning methods fail to address dynamic demands and complex socio-spatial variables. Meanwhile, the rapid rise of diversified mobility options—such as shared mobility, electric vehicles, and autonomous technologies—has redefined the role of public transit within urban systems. This study reexamines the foundational role of public transportation within an adaptive planning framework, seeking to provide scientific insights to address supply-demand imbalances through theoretical innovation and methodological advancements.

This research addresses three core questions: What are the theoretical shifts required for adaptive planning under global crises? How can the key attributes of adaptive planning be characterized? What role does public transportation play in this framework? By conducting a systematic literature review, the study synthesizes the core concepts and developmental trajectories of adaptive planning, offering a context-specific theoretical definition that bridges Chinese and European planning perspectives.

Focusing on public buses as a case study, the research examines its evolving foundational role amid the proliferation of diversified mobility modes and investigates the structural causes of supply-demand mismatches. It integrates the dynamics of collaboration and competition among multiple transport modes into the planning process, expanding the boundaries of traditional transit planning paradigms. A representative Chinese city is selected for empirical analysis, employing a combination of quantitative models and qualitative methods to assess supply-demand matching and its influencing factors. The study develops a multi-dimensional evaluation system—including metrics for accessibility, equity, and resilience—to systematically assess the operational performance of public buses systems. The results inform the construction of an adaptive planning framework aimed at achieving dynamic supply-demand alignment and offering actionable decision-making support.

The findings reveal that traditional efficiency-driven planning paradigms are insufficient to address increasingly complex urban challenges under planetary crises. Public transportation remains irreplaceable as the backbone of urban mobility, yet it requires collaborative innovations in planning and operation to align with other mobility modes. Adaptive planning must move beyond static optimization, emphasizing dynamic responsiveness and multi-dimensional collaboration to bolster urban resilience against uncertainty. This study proposes a “resilience-oriented adaptive transit planning framework” centered on: (1) multi-level governance mechanisms to foster inter-modal coordination; (2) data-driven dynamic response systems to enhance service flexibility; and (3) equity-focused evaluation systems to ensure the fair distribution of transportation resources.

By embedding the principles of dynamic adjustment into supply-demand matching, this framework enhances system efficiency, user satisfaction, and resilience against both immediate disruptions and long-term trends. Theoretical advancements and empirical findings contribute to the global academic discourse on adaptive planning, offering a unified framework that integrates technological innovation, institutional reforms, and

social equity. These insights provide practical solutions for the sustainable development of ground public transit and the systemic optimization of urban mobility.

Adaptive planning plays a significant role in addressing complex urban issues and has become an important direction leading the theoretical transformation of global urban and transportation planning. Future research should explore the transformative impact in the context of digital innovation, climate change, and urban disparities between the Global North and South, extending its relevance beyond transportation to broader urban systems.

Reimagining the Safe System: A Case for Equity in Road Safety

Author: Hulya Gilbert^{None}

Co-author: Ian Woodcock¹

¹ *The University of Sydney*

Corresponding Authors: h.gilbert@latrobe.edu.au, ian.woodcock@sydney.edu.au

Road violence is a global issue, with its devastating impacts felt at the individual, community and national levels. Around the world, road crashes claim over 1.3 million lives annually, causing injuries to millions more with widespread social disruption and massive public health costs. There is a marked inequity in the prevalence of road violence across modes, cohorts and places, disproportionately affecting low and middle income countries as well as children and people walking or riding, especially among old people, a demographic increasing in many parts of the world where populations are stabilising or falling.

Recognising the massive impact of road violence, policymakers around the globe have moved towards the Safe System approach, a holistic strategy aimed at designing transport systems to anticipate and accommodate human error, ensuring that car crashes do not result in severe injury or death. This approach challenges more traditional road safety strategies where some degree of death and injury is seen as an acceptable price to pay for the benefit of car-based mobility. Importantly, the Safe System approach places the emphasis on making the transport system safe for people using it, rather than on how people can use the system more safely.

While the Safe System approach represents a much-needed paradigm shift, it continues to grapple with a number of inherent contradictions, weaknesses and limitations. The varying success rates of Safe System approaches across regions and over time highlight

how these challenges manifest differently depending on local contexts and implementation strategies. For instance, while some countries have achieved significant reductions in road trauma over the past two decades, others, like Australia, are confronting growing challenges. In 2023, Australia experienced its deadliest year on the roads since 2016, with First Nations people, young and older individuals and pedestrians disproportionately affected. Despite this, the equity dimension of road safety including within the Safe System approach remains underexplored.

The approach is further hindered by its limited attention to feedback loops and context misfits, which often result in an inability to address the deeply entrenched social, cultural, economic, political and environmental forces that perpetuate the root cause of road trauma: car dependence. These ingrained forces create a self-reinforcing feedback loop that undermines efforts to effectively reduce road trauma. For example, the framing of Safe System approaches often narrows its focus to reducing harm within a car-dependent framework, implicitly endorsing the principle that ‘any amount of vehicle driving is acceptable as long as no one is killed or severely injured.’ This reveals a lack of genuine systems thinking, despite the use of the word “system” in its title. As a result, the systemic issues that drive car dependence remain unchallenged, undermining the potential for transformative change, including the achievement of a safe, healthy, sustainable and equitable transport system.

By providing a comparative examination of the language and methodologies used within the domains of shared responsibility, safer users and safer vehicles, the paper identifies key differences and similarities within the Safe System approach where it has been implemented and explores their implications for its success. Central to this discussion is the consideration of equity, which is vital for ensuring that road safety interventions are attentive to the existing inequalities and their underlying causes across different modes, cohorts and places.

Through a proposal of actionable strategies to improve the Safe System approach, this paper argues that embedding equity into both its methodologies and language is crucial for improving its effectiveness, not only in achieving Vision Zero but also in creating healthier, more equitable and environmentally sustainable transport systems and communities.

³ *University of Groningen*

Corresponding Authors: marketta.kytta@aalto.fi, valtteri.t.nurminen@aalto.fi, tiina.rinne@tuni.fi, s.ramezani@rug.nl

For the last decades, the planning of our cities has been heavily centered around automobility. This focus has fostered a widespread reliance on private cars, resulting in numerous adverse consequences at both local and global scales. These include compromised safety, lowered physical and mental health, environmental damage, multi-leveled injustice, and the excessive use of space, time, and resources (e.g., Nieuwenhuijsen & Khreis, 2016; Miner et al., 2024).

Addressing these challenges requires a fundamental reshaping of urban systems to prioritize and enable public and active transportation (Gössling, 2016; Nieuwenhuijsen & Khreis, 2016; Miner et al., 2024). Hence, among other actions cities worldwide are investing in public transportation, with Light Rail Transit (LRT) often viewed as a promising solution for enhancing transit networks and serving as the backbone of sustainable urban mobility systems.

In 2023, a new LRT system started operating in the Helsinki metropolitan area, Finland. The new LRT enhances the transverse public transport connections and increases the reliability, capacity, and comfort of public transport, among other benefits.

Our study aims to assess the impacts of the new LRT in the Helsinki metropolitan case. We are particularly interested in the interplay of lifestyles and mobility behavior to understand how such public transport interventions impact different population groups. We also wish to see if the new LRT can decrease the car usage of the residents living in the vicinity of the new LRT.

To achieve these objectives, we employed randomly sampled Public Participation Geographic Information System (PPGIS) surveys conducted before and one year after the LRT started running. Through the survey, we collected data on participants' regular destinations, frequency of visits, travel modes, and preferences regarding mobility and neighborhood values, aiming to reveal the underlying lifestyles and mobility habits. We used comparative analysis to assess the changes in mobility over one year, and k-means clustering to identify three different resident profiles.

As a result, we found that the share of trips made by public transport increased in our study area following the LRT implementation. However, at the same time, car usage also increased in the area. Furthermore, we found one group that was especially prone to change their mobility behavior following the LRT intervention. This group, representing 43% of the participants, increased their public transport usage the most while reducing their car usage. Conversely, residents with car-centric lifestyles were the least likely to change their behavior in a more sustainable direction.

Our results suggest that more ambitious actions are needed for a large-scale sustainability transformation. These could include simultaneous push and pull methods to realize the synergetic benefits of transport interventions.

Our study provides an in-depth understanding of the effectiveness of LRT in altering urban mobility patterns and promoting sustainable transportation. By analyzing shifts in residents' mobility behaviors, the findings will offer insights for urban planners and policymakers to design more sustainable and efficient mobility systems.

Can pedestrianization trigger gentrification? Insights from

Barcelona's transformations

Author: Pablo Villar-Abeijón¹

Co-authors: Carme Miralles-Guasch¹; Oriol Marquet¹

¹ *Universitat Autònoma de Barcelona*

Corresponding Authors: pablo.villar@uab.cat, carme.miralles@uab.cat, oriol.marquet@uab.cat

In recent years, cities around the world have launched ambitious urban transformation programs aimed at enhancing pedestrian mobility and improving public spaces. These initiatives often reflect a broader movement towards creating more livable and sustainable urban environments. Barcelona, with her internationally acclaimed Superblock flagship program, is a great example of that. Pedestrian-friendly designs are celebrated for their potential to reduce air pollution, encourage healthier lifestyles, and foster community interactions. However, these projects are not without criticism, and one significant area of concern involves their social consequences. A recurring critique of these policies is their potential to drive up land prices, making certain neighborhoods more attractive to wealthier individuals and displacing vulnerable populations in a process known as gentrification.

While extensive research has examined the phenomenon of "green gentrification"; that is, the gentrification processes triggered by urban greening projects like parks and greenways, relatively little attention has been given to other forms of urban transformation. The social justice implications of pedestrianization schemes (urban interventions that convert vehicular streets into pedestrian-only zones) remain underexplored. Existing studies on the spatial determinants of housing prices suggest that walkability is linked to higher land values, which can inadvertently contribute to exclusionary processes. Yet, it is unclear whether smaller-scale interventions like pedestrianization alone are sufficient to drive significant demographic changes in urban areas.

This study seeks to address this gap by analyzing the sociodemographic impacts of pedestrianization in Barcelona. Specifically, it examines whether such projects have triggered gentrification-like changes in the social composition of affected neighborhoods. Using a self-elaborated database documenting pedestrianization projects in the city from 2012 to 2020, combined with fine-grained annual sociodemographic data, the research employs a Difference-in-Differences (DiD) analysis. This method compares changes in demographic indicators in pedestrianized areas with non-pedestrianized areas, isolating the effects of pedestrianization from broader urban trends.

The findings reveal significant trends that, though small now, are growing over time. Pedestrianized areas have attracted a disproportionate number of European and North American newcomers compared to what would be expected in the absence of intervention. They have also received a higher-than-expected influx of highly educated residents, and a reduction of the proportion of those with lower level of studies. Additionally, these areas have experienced an increase in residents aged 31–64, a demographic often associated with higher income levels. These shifts suggest that pedestrianization projects may contribute to changes in neighborhood composition, attracting new residents that are wealthier, more educated and come from more affluent countries.

The implications of these findings are significant for urban policymakers. Pedestrianization projects, while beneficial in driving modal shifts and improving quality of life, may inadvertently undermine goals of social equity and inclusion. If such initiatives disproportionately attract wealthier groups, they could indirectly raise housing prices and lead to the displacement of previous residents, exacerbating urban inequalities and raising an issue of urban justice. Policymakers need to be aware of these dynamics when implementing pedestrianization schemes and consider measures to mitigate potential adverse effects.

This research also highlights the relevance of small-scale urban transformations. While some bigger Superblock interventions were considered in the study, most of the interventions were smaller interventions spread across the city, leading to consider the significance of small-scale projects in driving broader sociodemographic shifts.

Designing policies that effectively address climate change pressures while guaranteeing the inclusion of vulnerable populations in urban life is a key challenge of contemporary urban planning. These results should not lead us to stop further pedestrianization schemes, but rather to consider which other policies need to be implemented along with them to ensure social justice.

Shaping the Future of Mobility Culture: An Expert-Driven Policy Roadmap

Author: Maxime Hachette¹

Co-author: Alain L'Hostis²

¹ AVENUES, Université de Technologie de Compiègne

² LVMT, Université Gustave Eiffel

Corresponding Authors: maxime.hachette@utc.fr, alain.lhostis@univ-eiffel.fr

Daily mobility patterns vary across regions but share key similarities, shaped by spatial, social, economic, and cultural factors. Mobility can be seen as a “culture” in itself, and in Europe, this culture is currently undergoing significant evolution. The Horizon 2020 project REBALANCE, involving six participants from six European countries until 2022, sought to explore the values and culture of future mobility. The project’s goal was to encourage a paradigm shift in mobility policy, urging greater attention to social values in decision-making and alignment with the Sustainable Development Goals (SDGs).

REBALANCE initiated discussions about the foundations of current mobility policies. By reflecting on existing frameworks, it brought together a broad network of experts and stakeholders to explore new mobility cultures and policies. The objective was to converge on a sustainable, shared vision and create a roadmap for a new mobility paradigm. What set REBALANCE apart was its focus on engaging high-level interdisciplinary thinkers who have traditionally not been involved in transport research. Philosophers, sociologists, psychologists, geographers, and legal experts played a crucial role in challenging the assumptions underlying conventional mobility paradigms. In addition to this interdisciplinary engagement, the project involved a group of visionaries and 14 transport experts. A key outcome was the creation of a Manifesto for a New Mobility Culture.

The project aimed to significantly influence European public policies on mobility and transport. It examined the evolution of mobility culture, identifying emerging trends through expert insights. These trends were translated into future scenarios, distinguishing between desirable and probable trajectories. Through surveys across European countries and extensive input from experts and thinkers, REBALANCE articulated a vision for the future of mobility. This vision was formalized in a manifesto addressed to European policymakers, calling for integration into future public policies. Supported by a roadmap containing concrete actions, timelines, and policy guidance, the manifesto offered a plan to break free from outdated paradigms. Additionally, it underscored the importance of communication in shaping mobility culture, examined the public interest in mobility issues, and proposed new methods for evaluating mobility projects to better address the necessary changes.

This presentation will focus on the roadmap and guide for future European mobility policies. It will detail the methodology employed to translate the REBALANCE vision into the manifesto and, ultimately, into the roadmap and policy guide. An innovative workshop, inspired by the Delphi method, was conducted to bring together experts, including scientists, associations, and industry representatives, to achieve a high level of consensus at every stage of the process.

Corresponding Authors: jian.zhuo@tongji.edu.cn, gaofy@tongji.edu.cn, zhaiduanqiang@tongji.edu.cn, zjn8548@163.com

(1)Background: In the context of global entry into the post-growth era, climate change and resource constraints pose unprecedented challenges, necessitating a reevaluation of conventional growth-driven development. The rapid industrial suburbanization in metropolises has led to the expansion of residential, employment and public service functions, with Shanghai being a typical case. Especially, the peri-urban zones surrounding central district are areas where spatial development conflicts concentrate, both generating and attracting a large amount of commuting traffic. However, due to their location at the end of public transport network, there is a shortage of public transit supply, causing a mismatch in commuting demand and supply. This prompts more suburban residents to commute by private cars, against the green transformation of transportation and sustainable development. In Shanghai Master Plan (2017-2035), the "Town Clusters" mode is introduced to organize suburban space, streamline industrial layout and

reduce long-distance commuting, and is anticipated to offer novel solutions for optimizing commuting patterns in peri-urban areas.

(2)Content: This research endeavors to assess the opportunities of existing green commuting options in peri-urban town clusters, including bus and rail transit. We focus on five typical town clusters located in Shanghai peri-urban areas. Our study integrates job-housing relationships derived from mobile phone signaling data, along with multi-source data on road network configuration and public transportation network. By leveraging the route-planning capabilities of online map platforms, the average commuting time cost of different transportation modes are computed. Employing key metrics such as the Public Transit Commuting Feasibility (PTCF), Commuting Time Competence (CTC) and Commuting Mode Competence (CMC), the study evaluates the distribution patterns of green commuting opportunities levels within each town cluster under diverse time thresholds and spatial extents, thereby identifying areas with sub-optimal green commuting opportunities. By means of the Geographically Weighted Regression (GWR) approach from perspectives of commuting demand and supply, the study dissects the core determinants of green commuting opportunities in peri-urban town clusters and attempts to formulate optimization strategies accordingly.

(3)Findings: Results of green commuting opportunities identification: Temporally, on weekday morning peaks, the opportunities of green commuting is typically lower compared to evening peaks. Geographically, areas in close proximity to rail transit stations exhibit markedly higher green commuting opportunities. The central zones of town clusters, benefiting from dense public transportation routes, tend to offer higher green commuting opportunities than peripheral areas. Residential communities within 3 kilometers of large industrial parks also display relatively high green commuting opportunities. At different hierarchical levels of town clusters, those with higher levels of development and greater industrial and population agglomeration generally demonstrate better green commuting opportunities. Within town clusters, central towns with nodal characteristics enjoy higher green commuting opportunities than ordinary towns. Crucial influencing factors: In terms of commuting demand, commuting distance exerts a profound impact on green commuting opportunities. Our survey in the “Nanxiang-Jiangqiao Town Cluster” reveals that when the commuting distance exceeds 10 kilometers, the proportion of commuters choosing green options drops significantly. Additionally, the uneven spatial distribution of workplaces and residences also counts. Regarding commuting supply, the density of public transportation stations and the connectivity of routes are crucial factors. Areas with high-density stations and well-connected routes exhibit stronger green commuting opportunities. Optimization strategies: Simulation results indicate that augmenting public transportation routes and frequencies, optimizing bus route layouts, and enhancing the connectivity of public transportation stations can effectively boost the overall green commuting opportunities within peri-urban town clusters.

(4)Summary: This study broadens the scope of research on green commuting and explores the evaluation methodology for green commuting opportunities within the peri-urban town cluster model, furnishes policy recommendations for facilitating the green transformation of commuting modes in metropolitan suburban areas.

Local accessibility and mobility behaviour in large-scale housing estates: comparative results from a multi-country residents' survey

Author: Thomas Verbeek¹

Co-author: Wilbert den Hoed¹

¹ *TU Delft*

Corresponding Authors: a.w.denhoed@tudelft.nl, t.verbeek@tudelft.nl

Large-scale housing estates (LHEs) present a unique setting for the sustainable mobility transition we are trying to bring about. Largely built between the 1960s and 1990s, they were typically developed on the outskirts of cities at inexpensive locations following specific spatial configurations and urban design principles, such as the provision of open green space between apartment blocks and a functional large-scale transport infrastructure focused on cars and public transit, supplemented by car-free inner areas. Furthermore, they also implemented the idea that the neighbourhood should provide everyday services, like schools, neighbourhood centres, healthcare and essential shopping. Although the design principles and ideas of LHEs were similar across Europe, they have followed different development trajectories since their construction. For example, Western European countries have developed a negative critique of LHEs, while in Eastern European countries, living in a LHE is more conventional. In several European countries, growing socioeconomic disparities in urban society become increasingly visible in LHEs, following immigration, segregation, and marginalization processes.

Today, LHEs are home to more than 40 million people in Europe alone and present a complex socio-spatial setting in which the quality and provision of urban functions and amenities, active travel use, and liveability are generally under pressure. Considering the renewed interest in proximity-based planning approaches, symbolized by the 15-minute city concept, these areas present specific challenges and opportunities. Spatially, there is sufficient population density for providing a basic level of services and amenities, but over the years, and to different degrees, they have left these areas. Given the often-peripheral urban locations and spacious layout of these neighbourhoods, many residents have become dependent on the car, as the availability of public transport has come under strain and walking and cycling infrastructure has often been neglected. Socially, many LHEs have become multicultural environments with increasing levels of deprivation, ageing and loneliness. Altogether, the ingrained spatial features and the social practices of a vulnerable local population complicate a just, accepted, and sustainable mobility transition.

Despite this diagnosis, urban planning studies have not yet formed a comprehensive understanding of mobility options and practices in LHEs, and of the interventions and strategies that could improve active mobility and local accessibility. That is why, in the European research project 15minESTATES, we focus on LHEs across Europe, critically applying the 15-minute city concept. In five case study cities –Delft (NL), Halle (DE), Riga (LV), Budapest (HU) and Sofia (BG) –we look at spatial structures, transport options and behaviour, location of functions and amenities, and people's needs, perceptions and satisfaction in LHEs. The findings will provide input for a co-creative process with local stakeholders, supported by modelling, where we will try to find concrete solutions and strategies to promote active mobility and use of local functions and amenities.

In our paper we will present the first results of a residents'survey that was carried out in the project's five case study LHEs, giving insight into current transport behaviour and mobility practices, as well as active mobility barriers and specific needs regarding local services and amenities. Through a comparative analysis we analyse the similarities and differences between LHEs in different socio-political and cultural contexts and try to identify patterns that might apply to LHEs elsewhere. In combination with qualitative research and spatial analysis carried out in other parts of the research project, we aim to better understand the challenges for sustainable mobility transitions in this specific yet widespread neighbourhood type, which has not yet received the attention it deserves.

T_03 MOBILITY (B) / 1775**Suburbia or Dead End Street? Rethinking Mobility in Central Europe**

Author: Jan Bittner¹

¹ CTU in Prague

Planetary crises of climate change, environmental degradation, and socio-economic inequalities are being accelerated by urbanisation patterns prioritising economic growth over ecological sustainability and social justice. A prominent example of such a phenomenon in the Czech Republic (and the whole Central Europe region) is suburbanisation, a long-ignored problem attributed to the idea of “free market growth.” Unlike integrated transport and land-use planning in Western Europe, the rapid post-socialist suburban growth in the Czech Republic is marked by spatial fragmentation and car dependency, deepening environmental and social concerns. This has reinforced socio-spatial inequalities, reduced access to essential services, and fostered unsustainable transport reliance. Rethinking suburban mobility strategies is urgently needed as urban areas aim for sustainable, just development models. In response, the Czech planning discourse started discussing accessibility-centred interventions to reduce car dependency and promote equitable mobility. These strategies are based on frameworks of 15-minute city, transit-oriented development (TOD), and low-traffic neighbourhoods. By integrating local amenities and enhancing public transport, planners hope to build resilient communities that reduce car reliance. However, these interventions need strong empirical support tailored to the unique socio-economic and spatial contexts of post-socialist cities. While international studies offer insights, their relevance to the Czech context is limited due to differing urban structures, policies, and economic conditions.

This paper contributes to addressing this gap by applying an advanced structural equation model (SEM) to analyse the relationship between built environment characteristics, socio-economic factors, and travel behaviour in suburban Prague. Specifically, the research examines the impact of local amenity accessibility on car dependency, measured through person miles travelled (PMT). Unlike conventional regression models, SEM captures the complex interdependencies between socioeconomic conditions, urban form, and mobility choices by incorporating latent variables and indirect effects. It offers a deeper understanding of mobility behaviours and their underlying structural relationships. The study includes a comprehensive set of amenities—such as educational facilities, healthcare services, retail, sports infrastructure, and community centres—while utilising geolocated travel diary data to provide detailed insights into individual mobility

patterns. Findings are further contextualised through case studies of selected suburban areas around Prague, assessing their implications for Czech planning practice.

The results reveal that socio-economic characteristics play a crucial role in shaping travel behaviour, often outweighing the direct influence of the built environment. Factors such as income levels, household composition, and employment status significantly determine mobility choices, including car dependency. This suggests that accessibility-centred interventions alone may have limited impact unless they are accompanied by policies addressing socio-economic inequalities. In particular, lower-income households often face constrained mobility options despite living in areas with high public transport accessibility. Therefore, strategies aiming to reduce car reliance must consider the broader socio-economic landscape to ensure that planning interventions effectively influence travel behaviour in post-socialist suburban contexts.

Urban equity and the spatial distribution of speed limits: “Fast” versus “slow” neighbourhoods?

Author: Samuel Nello-Deakin¹

¹ *Autonomous University of Barcelona*

Corresponding Author: samuel.nello@uab.cat

As evidenced by the popularity of proposals to implement city-wide traffic speed limits (typically 30 km/h or 20 mph), lowering urban speed limits is increasingly acknowledged as a key measure to foster inclusive streets, improve liveability and reduce the environmental impacts of motorised traffic (Yannis and Michelaraki 2024). By diminishing the “radical monopoly” of motorised traffic on urban streets, lowering speed limits may contribute to increase equity between transport modes and social groups (Illich 1974). However, little research has sought to assess street speed limits through the lens of urban

equity: existing research on urban speed limits tends to be rather technical and narrowly focused on their effects on traffic accidents and public health (Kravetz and Noland 2012; Cairns et al. 2015; Pilkington et al. 2018), rather than framed within broader conceptual debates related to urban equity and transport justice.

Responding to this research gap, the aim of the present paper is three-fold. Drawing upon existing reflections on the connection between transportation speed and socio-spatial justice (Illich 1974; Graham and Marvin 2001), at a theoretical level I seek to advance the idea that assessing the spatial distribution of street speed limits offers a novel and meaningful measure of urban equity. At a methodological level, I propose a method of extracting street speed limit information from OpenStreetMap data, and explore various indicators of speed limit distribution at a neighbourhood level. At an empirical level, finally, I assess the relationship between street speed limits and selected neighbourhood characteristics in Barcelona. Is the distribution of speed limits equitable between neighbourhoods, and to what extent do differences in speed limits between neighbourhoods reflect broader socio-spatial inequalities? In this respect, the present study seeks to contribute to the emerging body of literature assessing the spatial and social equity dimensions of traffic calming schemes (Aldred et al. 2021; Nello-Deakin 2024).

My analysis relies on publicly available street speed limit data from OpenStreetMap. To analyse and compare the distribution of street speeds limits between neighbourhoods, I extracted, cleaned and summarised speed limit information for all streets in Barcelona using the open software R, which I then used to calculate four proposed aggregate indicators of street speed limits at a neighbourhood level. To assess the extent to which the proposed speed limit indicators are related to key neighbourhood characteristics, I subsequently explored their relationship with selected neighbourhood level variables through bivariate correlation analysis.

My results show that average speed limits vary significantly between neighbourhoods, reflecting the existence of spatial inequities regarding the negative spatial externalities of automobility. Although my analysis shows that neighbourhoods with higher speed limits tend to have higher incomes and motorisation rates, it also draws attention to outlier neighbourhoods which combine high traffic speeds and low motorisation rates. From a distributive justice perspective, I argue that these outlier neighbourhoods can be thought of as being unfairly exposed to high traffic speeds which are mostly attributable to passing car traffic generated beyond the neighbourhood. Finally, I suggest that the proposed speed limit indicators could easily be replicated in other in other cities, enabling cross-city comparisons and facilitating the identification of leading cities in this domain, thereby providing a useful tool for research, advocacy and policy initiatives seeking to reduce urban traffic speed limits.

Is SUMP a Panacea for Dynamic Cities? Bridging Ambition and Reality: A Case Study of Istanbul**Author:** Metin Senbil¹**Co-author:** Emine Yetiskul²¹ *Gazi University*² *Middle East Technical University***Corresponding Authors:** senbil@gazi.edu.tr, yetiskul@metu.edu.tr

Sustainable Urban Mobility Plans (SUMPs) have emerged as a key framework for addressing the transportation challenges of urban areas by emphasizing sustainability, inclusivity, and environmental responsibility. Developed within the European Commission's policy landscape, SUMPs aim to integrate public transport, active modes like walking and cycling, and land-use planning into a cohesive strategy that reduces greenhouse gas emissions and promotes equitable access to mobility. Despite their promise, SUMPs face critical challenges when applied to dynamic and rapidly expanding metropolises such as Istanbul, a city characterized by rapid population growth, increasing car ownership, and sprawling urban development (Rupprecht et al., 2019; Werland, 2020).

Istanbul's SUMP illustrates how a framework designed for stable urban environments struggles to adapt to the complexities of a fast-growing city. While the plan aspires to promote sustainable modes of transport, it inadequately addresses integration with land-use policies and urban design. The fragmented pedestrian and cycling infrastructure highlights a disconnect between planning and implementation, resulting in limited utility for active mobility initiatives. Similarly, the absence of robust measures to curb private car use, such as congestion pricing or low-emission zones, undermines efforts to reduce traffic congestion and environmental impact (Przybylowski, 2018; Spadaro and Pirlone, 2021).

Additionally, Istanbul's significant investments in rail transit expansion reveal a missed opportunity to integrate new infrastructure into a cohesive multimodal strategy. The lack of alignment between metro, tram, bus, and ferry systems exacerbates inefficiencies, limiting the potential benefits of these critical developments (Yaoundé SUMP Summary, 2019; Kiba-Janiak and Witkowski, 2019). The challenges faced by Istanbul emphasize the need for SUMPs to incorporate real-time data analytics and adaptive planning tools, ensuring that policies evolve with the city's rapid changes (Wołek, 2014; Rutka et al., 2024).

Central to overcoming these challenges is the need for institutional changes in Istanbul's administrative structure. The current framework, characterized by fragmented and distributed decision-making across multiple agencies, undermines the effectiveness of transportation planning. A restructured governance model that consolidates decision-making authority under a unified body is essential. This single, centralized institution should be tasked with integrating transportation and land-use planning, ensuring a holistic approach to urban mobility challenges. Without such institutional reforms, the successful implementation of SUMP initiatives will remain elusive, and the potential of these plans will be limited by inefficiencies and conflicting priorities across sectors.

Establishing stronger connections between transportation and land use is another critical institutional shift. Urban mobility cannot be effectively addressed in isolation; it requires close collaboration with urban design and development strategies. A governance framework that formalizes the relationship between these domains can enable more cohesive policies, facilitating the creation of mixed-use developments, transit-oriented projects, and pedestrian-friendly spaces. This alignment would not only enhance the feasibility of sustainable mobility solutions but also contribute to reducing commute times and improving overall quality of life.

This study proposes a reimagined SUMP framework for Istanbul, emphasizing land-use integration and transit-oriented development. Policies such as enhancing public spaces

for pedestrians, expanding non-motorized transport networks, and introducing innovative car-use restrictions are essential to fostering a sustainable mobility culture. Moreover, effective stakeholder engagement, including citizens, policymakers, and private entities, is crucial for implementing inclusive and responsive strategies (Lindenaua and Böhler-Baedeker, 2014; Andréi and Papuc, 2021). Istanbul's experience offers valuable lessons for cities facing similar challenges, underscoring the necessity of adapting SUMP to local contexts. By aligning long-term urban development goals with flexible, innovative mobility strategies, and implementing critical institutional changes, SUMP can transcend their current limitations, providing transformative solutions for the cities of tomorrow. This paper aims to contribute to propose a vision for advancing SUMP in rapidly changing urban contexts, offering a roadmap for sustainable and inclusive mobility planning.

Opening closed practices to other ways of seeing: Transport and Urban Planning's imperative for self-reflection and re-invention

Author: Hulya Gilbert¹

Co-authors: Ian Woodcock²; Marco te Brömmelstroet³

¹ La Trobe University

² The University of Sydney

³ University of Amsterdam

Corresponding Authors: h.gilbert@latrobe.edu.au, m.c.g.tebrommelstroet@uva.nl, ian.woodcock@sydney.edu.au

To influence the formation of alternative trajectories for socially and environmentally just futures, transport and urban planners must challenge the status quo. To achieve this, they must actively facilitate a ‘cultural reform’ by bringing in new insights, knowledges, new narratives and new discourses with a commanding presence. However, the currently dominant ontologies, epistemologies, methodologies and tools of these disciplines are inadequate to open up alternative epistemic possibilities and imagine alternative pathways compatible with contemporary imperatives for equity, justice, health and wellbeing.

For transport and urban planners to achieve the cultural transformation required means seeing themselves and their disciplines differently. Rather than separate disciplines, with their individual objects and pre-occupations, they must see themselves as being not only mutually dependent but also part of the same processual entity. To enable this ontological shift entails these disciplines first to critically engage with their modes of being in the world and how they feed desires and outcomes contradictory to an equitable and climate just future.

What keeps sustainable transport and land use planning apart and how can they become genuinely integrated? While ‘integrated transport and land use planning’ is an easy phrase that has been repeated for decades, transformation begins with ‘being’ and to ‘become different’ requires seeing oneself and the world one is implicated in clearly. For instance, to what extent can we observe that meaningful change has occurred in terms of planning and building more equitable, sustainable, healthy urbanisms? Those small niches of celebrated progressive practice (we see you! We know who you are!) appear currently to be overwhelmed by a global regime of planet-destroying urbanism, cynical or perhaps just misguided at best.

In this paper, we advocate for an open-minded approach to counter-hegemonic alternatives. We argue that the framing of transport and urban planning and thus, planners - those with the agency to make change - is within a long-standing devious discursive space that is a powerful contributor constraining our self-reflective capacity and concomitantly, planners’ ability to facilitate the transition.

Acknowledging the principles of social constructionism, which assert that truth and knowledge are created and legitimised within different discourses and narratives, this position paper examines core aspects of the contemporary discursive landscape of transport and urban planning with a focus on Australia.

The settler colonial Australia’s urbanism represents a range of extremes, reflecting its ongoing struggle to address numerous contrasts and contradictions. A defining feature of this urbanism is the very high levels of automobility and the devious discourses that maintain the nation’s cultural and economic dependency upon it.

We explore some key practices shaped by these discourses and, in turn, how these practices help perpetuate their own discursive framing. In recognition of the narratives, values, assumptions and judgements that wield significant power in underpinning the discursive spaces of transport and urban planning, we illustrate how this discursive space coerces the urban and transport planning fields into operating as ‘closed practices’. By so doing, we aim to facilitate a critical discussion and encourage the self-reflection transport and urban planners urgently need to have. We conclude by describing some possible pathways for reorienting the transport and urban planning field toward embracing alternative epistemic perspectives and enabling long-overdue cultural reform.

Prosumers’ Adoption Behavior of Shared Parking Services: Implications for Sustainable Urban Planning

Authors: Doosun Hong¹; Sunghoon Jang¹

¹ *The Hong Kong Polytechnic University*

Corresponding Authors: sunghoon.jang@polyu.edu.hk, doosun.hong@polyu.edu.hk

Rapid urbanization has posed numerous challenges for major cities around the world, with a critical issue being the shortage of adequate parking spaces. As reliance on private vehicles has increased, the availability of parking spots has not kept pace. Consequently, drivers often spend significant time searching for parking, which leads to higher carbon emissions. To address this problem, the concept of shared parking services has emerged. Shared parking apps allow citizens to act as both providers, offering their unused parking spaces, and consumers, utilizing available spaces when needed. This dual engagement creates a new concept known as “prosumers.” Prosumers not only intend to share their parking spaces but also intend to use the spaces of others. However, current urban planning does not adequately reflect the behavioral intentions of prosumers, treating them as if they are the same. Recent research in behavioral economics indicates that prosumers may have different intentions when it comes to sharing their own parking spaces compared to using others’. Additionally, these intentions are influenced by various factors. Understanding these differences is essential for planning sustainable shared parking services. This study aims to investigate the behavioral intentions of prosumers regarding shared parking services. We conducted a web-based survey targeting prosumers who have actively participated in the service as both providers and consumers. To deeply understand prosumers’ intentions, we have developed model frameworks based on the extended theory of planned behavior, incorporating perceived risk theory. We hypothesize that socio-demographic variables and land use factors significantly affect these intentions. Our findings reveal a notable trend: prosumers exhibit a generally lower intention to share their parking spaces compared to their intention to utilize the parking spaces of others. Furthermore, our analysis indicates that various dimensions of perceived risk significantly influence prosumers’ behavioral intentions to either share their own parking spaces or to use those offered by others, but these effects manifest in distinct ways. For instance, perceived performance risk has emerged as the most significant factor affecting the intention to share parking spaces. This is particularly evident among older and female prosumers residing in city centers, who may have heightened concerns about the reliability, safety, and quality of the shared parking experience. Such concerns could stem from the potential for damage to their property or the apprehension about the security of sharing their spaces with strangers. On the other hand, perceived financial risk plays a crucial role in shaping prosumers’ intention to use the parking spaces offered by others. This is especially pronounced among low-income individuals living in neighborhoods where shared parking availability is limited. These individuals may be particularly sensitive to costs associated with parking, fearing that they could be overcharged or that the pricing might not align with their budgetary constraints. The financial considerations surrounding this risk factor can significantly deter them from utilizing shared parking services offered by their neighbors. Given these insights, we propose several actionable strategies that urban planners can implement to enhance the effectiveness and sustainability of shared parking services.

Perceived Barriers and Enablers to Using Transit: Understanding heterogeneity of perceptions across different groups of the population

Authors: Ariel Arosemena¹; Jill Blakley¹; Ehab Diab¹

¹ *University of Saskatchewan*

Corresponding Authors: ehab.diab@usask.ca, jill.blakley@usask.ca, ariel.rosemena@usask.ca

Improving public transit to attract new riders and retain existing ones has been seen as a major priority for many cities worldwide. This is to foster their abilities to move towards sustainable development by meeting their CO2 emissions reduction goals, while achieving a wide array of social, equity, and economic objectives. Cities strive to understand how users perceive different challenges, or barriers, to using these systems and their views of the needed interventions or solutions to improve such systems, or enablers. Several studies have indicated that perceived barriers could influence people's activity participation and well-being (Prayitno and Moos, 2022). Additionally, perceived aspects such as safety, comfort, and social interaction can play a significant role in passengers' travel choices (Trepáčová et al., 2021). These perceived barriers could also vary across different groups of users (Allen and Farber, 2018). While previous research has focused on understanding perceived barriers or enablers to using transit for specific groups (e.g., females and students), little has been done to investigate perceived barriers among different groups that can be engaged in the planning process. To address this gap, this research aims to examine the perceived barriers and enablers while understanding differences between different population groups. Two primary groups were identified: those with individual-related barriers and those who, despite not perceiving any personal barriers, perceive societal barriers. Furthermore, these two groups were broken down by gender, use of transit, and university status.

To achieve the aforementioned goals, the study uses data collected from a large online survey conducted in 2024, called the USask Mobility survey (1,600 respondents), to understand travel behaviors and perceptions of the University of Saskatchewan's population. The University of Saskatchewan is a major educational, community service, and employment center in the city of Saskatoon, Saskatchewan, Canada. In recent years, the commuting patterns of university students have received increased attention due to their large numbers and their potential for behavior transformation, as students tend to adopt new travel habits during this period of their lives (Cadima et al., 2020). A mixed methodology approach was utilized to analyze open-ended and Likert scale questions of perceived barriers and enablers collected from the survey. The initial results show significant disparities in barrier perceptions across different demographic groups, including gender, with females more likely to perceive individual-related barriers and males more likely to report society-related barriers. Nevertheless, regardless of the group, participants consistently identified transit route and system planning issues as the most common perceived barriers and enablers. This research underscores the importance of tailored transportation solutions to enhance transit use and users' retention. By understanding a wider array of perceived barriers and enablers, cities and transit agencies will be able to better direct their resources to improve different groups of users' experience while adjusting service aspects to address different groups of users' concerns, thus building a more inclusive system. In other words, the study offers cities important insights that can be used to foster the development of more equitable transit systems for diverse groups of users.

T_03 MOBILITY (B) / 1098**Operationalising Mobility Justice in Urban Street Transformations: Insights from Five European Cities****Author:** Enrica Papa¹**Co-author:** Sabina Cioboata¹¹ *School of Architecture and Cities, University of Westminster***Corresponding Authors:** e.papa@westminster.ac.uk, s.cioboata5@westminster.ac.uk

Urban streets are critical spaces for addressing the intertwined challenges of mobility, equity, and sustainability. Far from being mere conduits for movement, streets are dynamic public spaces (Bertolini, 2020) where diverse mobilities and needs intersect, and where issues of justice and equity are contested. Drawing on Mimi Sheller's (2018) foundational theories of mobility justice, this research investigates the application of justice principles in urban transformation processes, focusing specifically on streets. Despite the theoretical significance of mobility justice, challenges remain with its exploration and operationalisation in practice (Verlinghieri 2024), particularly in the context of street transformations. What is more, seeing street transformations merely as socio-technical innovations can risk obscuring their aim of bringing together the different, often contradictory interests and needs of multiple actors –an intrinsically political exercise. This study aims to highlight how theories of justice—distributive, procedural, recognition, and epistemic—can offer a lens to better understand streets not just as technical infrastructures but as inherently political spaces where power, access, and identity are negotiated. A focus on street transformations also generates reflections on their potential to catalyse systemic change by addressing the inequities embedded in urban transport systems.

More specifically, this study examines how mobility justice can be operationalised in street transformation projects across five European cities: London (UK), Amsterdam (NL), Braga (PT), Kozani (GR), and Riga (LV). Conducted within the framework of Just Streets - an €11 million EU Horizon project involving 32 transdisciplinary partners - the research evaluates interventions such as street space reallocation/reclaiming (London Harley Street, Kozani, Riga), active mobility infrastructure improvements and tactical urbanism (Amsterdam) and school zones for child-friendly mobility (London Lambeth and Braga). These initiatives aim to prioritise marginalised groups, foster equitable access, and redefine streets as inclusive spaces for social interaction, environmental sustainability, and community well-being.

The research addresses two central questions:

1. What are the key dimensions of mobility justice, and how can they be systematically applied to guide street transformation processes?
2. What practical challenges arise in operationalising mobility justice within street transformation initiatives?

To answer these questions, the study adopts a multifaceted framework of mobility justice, integrating distributive justice (equitable resource allocation) (Pereira et al., 2017), procedural justice (participatory decision-making), recognition justice (acknowledging diverse mobilities) (Sheller, 2018), and epistemic justice (valuing non-expert knowledge) (Fricker, 2007). The research draws on policy analysis, case study reviews, stakeholder interviews, and site observations to explore how mobility justice principles are applied in planning practice and implementation processes.

Findings demonstrate that streets provide a unique opportunity to address systemic inequalities through tangible, localised and context-specific interventions. Some cases highlight the importance of participatory planning processes that empower marginalised voices, ensuring that transformations reflect community needs and priorities. Similarly, street changes that incorporate diverse knowledge systems

and acknowledge diverse mobility and social needs demonstrate not only greater effectiveness in achieving equitable outcomes but also greater community acceptance of transformations. Additionally, street space reallocation cases from the five cities highlight the potential for the equitable redistribution of street resources by prioritising space for street users who had been previously marginalised. The study also highlights a number of challenges with operationalising mobility justice in practice. These include reflections on the concept of justice itself being notably absent from city planning documents, the lack of methodological frameworks and metrics for evaluating justice-related outcomes of street transformations, and limited institutional capacities for community engagement, frequently resulting in superficial consultation processes.

Finally, the study provides important reflections on the potential of localised, justice-centred street interventions to help shift urban transport planning from efficiency-driven paradigms to those prioritising equity, care and accessibility.

The Flux of Urban Mobility and Social Discourse on Bus Usage: A Text Mining Approach to Global Public Perceptions of Bus Services in the Digital Age

Authors: Yanyun MAO¹; Jian ZHUO²

¹ *Urban Mobility Institute, Tongji University*

² *Urban Mobility Institute & College of Architecture and Urban Planning, Tongji University*

Corresponding Authors: yanyunmao@tongji.edu.cn, jian.zhuo@tongji.edu.cn

The rapid evolution of urban built environments has significantly enhanced the mobility of people, goods, and information. The integration of social and technological systems in urban transportation has created a complex urban framework, presenting substantial challenges to mobility planning and policymaking. Among various transportation modes, buses are particularly significant due to their wide coverage, large capacity, and mass user base, making them essential for addressing these challenges. However, with the rise of diverse transportation options in the digital era, a critical question arises: Is there still a need for buses? Or, more specifically, should buses continue to play a central role in the evolution of urban mobility?

Buses offer several advantages, including affordability, large capacity, and the ability to serve marginalized communities, providing equitable mobility services across urban areas. However, they face significant ridership losses due to the growing popularity of new, private-oriented modes of transport, such as ride-hailing services, carpooling, shared bicycles, and rail-based transport. While multimodal transportation systems offer many benefits, the role of buses in providing emergency transportation support and maintaining connectivity for communities beyond major corridors is invaluable. In a broader sense, buses remain the backbone of urban transportation systems, supporting the development of more advanced modes and acting as a “silent enabler” that underpins urban mobility, even in an era of emerging technologies like eVTOL.

Public dissatisfaction with buses has become a key obstacle to the coordinated development of multimodal transportation systems, hindering overall transportation efficiency. This study aims to identify public perceptions and sentiments toward buses using a user-centric approach. By analyzing global data across diverse cultural contexts, this research highlights both commonalities and differences in public attitudes, providing valuable insights into universal user demands and helping identify strategies to address declining ridership.

The research employs grounded theory from a transportation sociology perspective and uses “positive search” and “negative search” strategies to collect textual data related to bus usage from international social media platforms such as Twitter, Facebook, Instagram, and TikTok. Through axial coding, sentiment analysis, and principal component analysis, this study identifies global users’ emotional inclinations and value expectations regarding bus services. Additionally, the study integrates findings from field surveys conducted in China, providing a localized perspective to the global discourse, offering a comprehensive analysis and solution framework.

The findings reveal that commuter travel is the most dominant use case for buses, while tourism and leisure are the most desired areas for service expansion. Public concerns focus on service quality instability, poor station planning, and other key issues such as unreliable schedules, inadequate coverage, overcrowding, and uncertain travel times, all of which reduce user satisfaction.

Improving urban mobility requires a deeper understanding of specific user needs. This study represents an initial step in this process by identifying the reasons behind public dissatisfaction with buses. By examining the “transport society” within digital networks, we offer a nuanced understanding of regional differences in public complaints and appreciation for bus services. Based on these insights, we propose adaptive optimization strategies for bus planning and operations, providing a public perspective to support the development of multimodal transportation systems. Moreover, we offer urban planning recommendations to enhance transportation services and contribute to the efficient, safe, low-energy, and low-pollution operation of cities. These efforts aim to resolve urban challenges and promote sustainable urban development.

T_03 MOBILITY (B) / 558**Car dependence dynamics between spatial and individual factors: a quantitative methodology addressing regional challenges in Lombardy (Italy)****Author:** Jaime Sierra Muñoz¹¹ *Politecnico di Milano***Corresponding Author:** jaime.sierra@polimi.it

Car dependence, a prevalent barrier to sustainable and inclusive mobility, emerges from complex interactions between spatial and individual determinants (Mattioli et al., 2016). While the process that relates both has always been challenging, reducing car pervasive impacts is a key aim for achieving a smarter, safer and fairer transport system. This makes the assessment of car dependence a critical issue, which is being addressed by this research as a part of a broader PhD project. This larger study develops a comprehensive framework for car dependence by systematically reviewing literature and constructing a large dataset of related indicator, enabling further numerical analysis. Within this context, the present study integrates spatial and individual insights, which are not often combined in academic approaches. It examines the results of an attitudes-and-perceptions survey categorized according to territorial car dependence levels emerging from spatial metrics. By means of a case study, this research focuses in Lombardy, Italy's most populated and richest region, characterized by a heterogeneous territorial structure.

The spatial analysis represents the first stage of the study and builds over literature-established metrics (Sierra Muñoz et al., 2024) to depict the phenomenon: from cause-and-effect indicators associations, bivariate classifications provide clusters of different car dependence levels across a regional context. These are aligned with different spatial settlement characteristics, with increasing car dependence from dense urban areas towards suburban and rural contexts. These spatial categories form the foundation for integrating individual-level insights in a second stage, which additionally categorize survey respondents based on their car dependence self-perception. Together, these spatial and subjective dimensions offer a comprehensive framework to examine attitudes and perceptions of car dependence across diverse territorial clusters.

The results highlight significant heterogeneity within and across different car dependence spatial clusters: around a quarter of respondents' self-perceived car dependence does not align with the spatial category of their residential area. The findings underscore the role of personal activities, particularly access to work in urban areas, as well as built environment perceptions and different attitudes towards use and impacts of the car. Surprisingly, respondents in suburban areas who do not feel dependent on cars often declare attachment to cars and less concern on their impacts. Conversely, their peers on rural clusters report higher car use together to dissatisfaction on its reliance. These findings illustrate how car dependence may enclose different meanings relating to space: from a practical necessity in some contexts to a deeper reliance on habitual or convenience-based car use, going further than simply feeling dependent.

The research challenges deterministic assumptions about car dependence based solely on socio-spatial factors. The nuanced interplay between spatial and personal dimensions of car dependence highlights the need for place-based approaches to studying the phenomenon. By recognizing the diverse drivers of car dependence in each context, tailored interventions can be developed to address the unique needs and rationales of each territory. For example, strategies for suburban areas might focus on reducing attachment to cars and overcoming its car-centered designs, while rural interventions might prioritize enhancing alternatives to reduce reliance.

This study contributes to broader discussions on reimagining mobility systems, providing deeper understanding of car dependence functioning across different territorial con-

texts. While car dependence sustains in a far-reaching and resilient automobility system (Urry, 2004), context-sensitive strategies represent an actionable way to mitigate it in a scalable manner. Integrating car dependence spatial and individual perspectives, as this research proposes, provides a way to bridge gaps and develop more accessible and fairer transport systems in the context of current mobility transitions.

The role of the car in a post car society

Author: jake wiersma¹

Co-author: luca bertolini¹

¹ *university of amsterdam*

Corresponding Authors: l.bertolini@uva.nl, jake.wiersma@planet.nl

The role of the car in a post car society

According to Ivan Illich in his book “Tools for Conviviality” (Illich 1973) each technical invention has its liberating effects, however, if not carefully managed, turns men into slaves of the same invention. The car is one of his favourite examples.

The original purpose of cars was (1) Leisure trips to the countryside for wealthy urbanites, and 2) supporting living /working in rural areas for farmers. In the 1950's a democratization of the car led to industrial production for a market instead of selected customers. Since then, instead of leisure trips or selective functional trips in industrialized countries the car has been used for ubiquitous, utilitarian trips like commuting and shopping, leading to the ‘cycle of car dependency’.

Although worldwide car use and ownership are rising, many governments currently are trying to shape conditions for a so called mobility transition, away from the car. However, the current ‘system of automobility’, as described by Urry, (Urry 2004) is proving extremely resilient to change. This system is not sustainable, as it needs mass production of private (e) cars, damaging the environment on macro level, and destroying the urban fabric on micro level.

In this discussion paper, we explore if and how rethinking the role of the car, starting from its original qualities, can help unlock this situation.

Key questions are: What are the essential liberating qualities of the car? Can these be again put centre stage? And: Can they be sustainable?

Our findings show that, in line with the original purposes:

- 1) A first unique quality of automobility is the possibility of leisure or social trips over longer distances to peripheral locations. This is liberating in a positive way.
- 2) A second unique quality is the possibility of functional trips to locations and/or times beyond walking/cycling/public transport range, but also special purpose such as trips carrying bulky goods, trips carrying people not able to walk/cycle/ride public transport

etc.

In the first category trips are mostly incidental. As incidental use is appropriate for sharing or renting, one feature of a sustainable automobility of the future could be the availability of renting systems for e-cars, for leisure or special trips. Renting instead of owning leads to more sustainability, as the demand for new produced private cars would drop dramatically.

In the second category trips are either incidental or daily. If people depend on the daily use of the car, renting is not very likely. However, as these daily trips are mostly individual, and covering relatively short distances, the present-day car is oversized and overpowered for this purpose. Downsizing of the car is possible. Variants of the microcar could fill this gap, leading to more sustainability, as the production and use of microcars seems to be less damaging for the environment and for the urban fabric.

The paper concludes that in a post car society the car could play two positive and sustainable roles: A rental system for leisure purposes and special functional trips, and, in a downsized form, for the societal participation of those who are daily dependent on the use of a car. The paper ends with some reflections how policy could create the conditions for such a transition.

Plugging into green mobility: public perceptions and barriers to V2G adoption

Author: Gonalo Santinha¹

Co-author: J ssica Tavares

¹ University of Aveiro

Corresponding Authors: g.santinha@ua.pt, jessicacostatavares@ua.pt

The global transition towards sustainable transportation systems is essential for mitigating the environmental and societal impacts of climate change. As a cornerstone of efforts to decarbonize the transport sector, electric vehicles (EVs) hold substantial potential to reduce greenhouse gas emissions and improve urban air quality, addressing critical global challenges. However, achieving widespread adoption of EVs is not without challenges, as unequal social and spatial access to these technologies remains a significant barrier in many regions. Vehicle-to-grid (V2G) technology represents a transformative innovation in this context, offering the potential to align individual mobility needs with broader sustainability goals. Despite its promise, the successful implementation of V2G depends heavily on public acceptance. Current research on V2G is predominantly technical, focusing on energy systems, grid integration, and battery performance. However, public perceptions and acceptance of V2G remain rather underexplored. This knowledge gap presents a significant challenge, as public awareness, understanding, and acceptance are critical to driving adoption. Furthermore, existing studies on public perceptions of EVs and V2G are fragmented, employing diverse methodologies and often yielding inconsistent findings.

This study aims to conduct a systematic review of the existing literature on public perceptions and acceptance of EVs and V2G technology. By synthesising and critically analysing the current body of research, the study seeks to provide an updated and comprehensive understanding of the factors influencing public acceptance of V2G. A systematic search was conducted across the Scopus and Web of Science databases, following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines. Manuscripts were screened using predefined inclusion criteria, and duplicates were managed with Rayyan software. Data extraction and coding were performed using MAXQDA, with its AI Assist functionality supporting thematic analysis.

The review included 17 manuscripts published between 2018 and 2024, with Europe, particularly the Nordic countries, leading contributions in this domain. Most studies focused on the benefits and challenges of V2G adoption, while motivations for its use received comparatively less attention. Private vehicle users, both EV and non-EV owners, were the most studied population group, with limited attention paid to institutional stakeholders and experts. Survey-based methods, particularly declared preference surveys, were the predominant data collection instruments, with sample sizes ranging from 306 participants at the local level to 5067 at the national level.

Findings show that V2G adoption is shaped by a combination of technical, economic, and behavioural factors. Key barriers include concerns about battery degradation, the limited range of EVs, and system complexity. These challenges are further compounded by spatial disparities, with urban residents prioritising infrastructure availability and rural residents focusing on range reliability. Trust in V2G technology also emerges as a critical issue, undermined by concerns over data security. Nevertheless, financial incentives such as subsidies and discounts, alongside strong personal commitments to sustainability, were identified as key drivers of acceptance and adoption.

These results highlight the critical need for evidence-based public policies that integrate technological innovation with public engagement and equity considerations. By addressing spatial and social disparities, policymakers can create conditions conducive to V2G adoption, fostering a more inclusive and sustainable energy transition. Additionally, this study provides a valuable foundation for future research and policy development, supporting the alignment of V2G technology with the needs of diverse communities and advancing global efforts to combat climate change.

Do car-restrictive policies shape elections? The electoral impact of implementing low-traffic zones.

Authors: Eva Van Eenoo¹; Freke Caset²; Marjolein Hantson³

¹ *Vrije Universiteit Brussel; KU Leuven*

² *Ghent University; Vrije Universiteit Brussel*

³ *Vrije Universiteit Brussel*

Corresponding Authors: marjolein.hantson@vub.be, eva.van.eenoo@vub.be, freke.caset@ugent.be

Car-restrictive policy measures such as low-traffic zones and car-free streets are increasingly implemented as cities seek to address challenges related to congestion, air pollution and climate change (Da Schio et al. 2023). While these measures aim to create more sustainable and livable urban environments, their implementation often sparks intense public and political debate. Transport stands out as a pervasive and pressing conflict in local politics (Paterson, 2007), with citizens and other sectors of society often actively resisting car-restrictive policies (Marquet et al. 2024a). This resistance contributes to a strong reluctance among policymakers to implement measures curbing car use (Unruh, 2000).

Lanzendorf et al. (2023) assert that the challenge lies not only in devising effective measures but also in garnering stronger public acceptance for the introduction of car-restrictive policies. Consequently, 'the public' becomes an increasingly influential and active participant in the ongoing debate. While the public tends to accept pull measures more easily (for instance, dedicated bicycle infrastructure and increased public transport provision), politically, push measures are much more challenging to implement. Hence, public acceptance often plays a pivotal role in determining the success of these policies, and if these can even be implemented in the first place.

The introduction of such policies can influence public opinion and, subsequently, electoral outcomes. Political parties advocating circulation measures may face backlash from segments of the electorate opposed to the changes, while others may gain support for their commitment to traffic safety and urban well-being. These dynamics raise questions about the interplay between public acceptance, policy outcomes, and political accountability.

Against this backdrop, this paper aims to contribute to the emerging work (e.g. Marquet et al. 2024b) questioning the electoral impacts of implemented car-restrictive measures. By analyzing two cities in Belgium (Ghent and Leuven) where low-traffic zones were recently adopted, we examine the electoral performance of the Greens, the political party most strongly associated with it. As such, we seek to understand whether such policies contribute to electoral gains or losses. By means of election results at the level of statistical wards, combined with a set of socio-economic characteristics, car ownership and built environment characteristics, we analyse to what extent the Green party has gained or lost at the municipal elections of October 2024. We hypothesize that higher car ownership and use is associated with lower votes for the Greens. Higher bicycle ownership, higher education level and age is expected to positively affect a vote for the Green party. In the paper, we test whether the Green party received more or fewer votes than would be expected based on the selected variables. By comparing the observed electoral results with the predictions derived from the statistical model, we assess if the adoption of low-traffic zones influences voter behaviour beyond what socio-economic and other relevant variables would suggest.

Why public transport policies work or not? A meta-analysis based on the Behaviour Change Wheel model

Authors: Jiayu Gu¹; Luyao Niu¹

Co-author: Wenjia Zhang²

¹ Peking University

² Tongji University

Corresponding Authors: luyao0160@163.com, gujiayu@stu.pku.edu.cn, wenjiazhang@tongji.edu.cn

Public transportation promotion policies are vital for reducing carbon emissions, improving public health, and fostering sustainable urban development. However, assessing their effectiveness is challenging due to inconsistent research findings and methodologies stemming from varied classification criteria (Hrelja et al., 2020). Additionally, although meta-analysis has been established as an effective method for evaluating policy outcomes (Gurevitch et al., 2018; Semenescu et al., 2020), existing meta-analyses often fail to explain why certain policies are more effective, primarily due to a lack of theoretical frameworks underlying these policies. This uncertainty can lead to the misallocation of financial resources, diminished public trust in policy initiatives, and the persistence of inefficient urban growth patterns. There is an urgent need for a clear, unified framework to standardize evaluations of public transport policies, enabling more consistent research and deeper insights.

To address the research gap, our study pioneers the use of the Behaviour Change Wheel (BCW) model to analyze public transport policies. Originally developed for public health and environmental protection, the BCW enhances policy design by systematically integrating factors that drive individual behavior change (Michie et al., 2011). This framework breaks down policies into three layers: policy, intervention strategy, and the Capability-Opportunity-Motivation-Behaviour (COM-B) model. Under the BCW model, the intervention strategies layer encompasses targeted actions that directly influence behaviors, while the COM-B layer identifies and addresses the key factors that drive or impede these behaviors.

Figure 1: Fig.1 Revised BCW model for the Evaluation of Public Transport Policies

Fig.1 Revised BCW model for the Evaluation of Public Transport Policies

The existing body of our study has extensively evaluated the impact of public transportation promotion policies using the BCW model. The policy layer categorizes public transport policies into six types: 1) Guidance; 2) Environmental and social planning; 3) Service provision; 4) Fiscal; 5) Communication and marketing; 6) Regulations, which are further

broken down into specific intervention strategies and individuals' capabilities, opportunities, and motivations within the model's deeper layers. To provide a deeper understanding of policy effectiveness, this study conducted a meta-analysis within the BCW framework, synthesizing data from 24 high-quality studies across 16 countries with over 5.59 million data points. We systematically coded each policy in those studies into the BCW model's three layers and performed stratified subgroup analyses to investigate the causal effects and mechanisms of six policy categories in promoting transit adoption.

The key findings are as follows:

1. The overall effect size of public transport policies is 0.5165. Within the policy layer, only guidance policies surpass this average; in the intervention strategies layer, incentivization, coercion & restrictions, modelling, and enablement demonstrate effect sizes above the average; within the COM-B layer, social opportunity and automatic motivation show effect sizes that exceed the mean.

2. Guidance policies are the most effective in promoting public transit adoption (n=12, d=0.881), **including incentivization, education, and coercion & restriction interventions.** They work well because they enhance reflective motivation (n=7, d=0.3418), automatic motivation (n=5, d=0.9034), and physical opportunities (n=5, d=0.4102), providing strong support for behavioral change.

3. Environmental and social planning policies are least effective policies (n=17, d=0.2093), **including environmental restructuring interventions.** These measures mainly improve physical opportunities through environmental changes (n=16, d=0.4102), but their limited impact on motivation makes it harder to sustain long-term behavior change.

4. Service provision policies provide substantial long-term benefits (n=21, long term d= 0.5285), **which combine environmental restructuring and enablement interventions.** These approaches strengthen automatic and reflective motivation (n=7, long term d= 0.6998; n=11, long term d=0.4148) and physical opportunities (n=17, long term d=0.438), leading to both immediate behavior changes and sustained public transit adoption.

From a linear infrastructure to a logistic operational landscape: the BreBeMi Motorway in Bergamo plateau

Author: Edmondo Pietrangeli¹

Co-author: Mario Paris ¹

¹ *Università degli Studi di Bergamo*

Corresponding Authors: mario.paris@unibg.it, edmondo.pietrangeli@unibg.it

Over the past decades, rural areas have experienced significant transformations driven by changing consumption patterns and lifestyles. These shifts have led to new urbanization forms, rendering the traditional urban-rural distinction less relevant. Among other dynamics, scholars in geography and urban studies pointed out the evolution of peri-urban spaces as “operational landscapes” (Brenner & Schmid, 2013, 2014). These areas are crucial in contemporary urban systems, because they are essential facilities, and they allow resource extraction, waste management, and logistics.

Logistics, in particular, has undergone profound changes since the 1980s, spurred by industrial decentralization and globalization. These changes have redefined global production systems, reducing the importance of localized production in favour of globally connected logistics nodes (Tadini, 2013). This shift facilitates the global flow of goods (Cabodi, 2001) and has led to the clustering of logistics functions. Such clusters often create logistics landscapes. These landscapes can be classified into three types based on their proximity to production sites (first mile facilities), markets (last mile hubs), or global flow infrastructures (platforms).

The expansion of logistics landscapes, particularly in suburban areas, has introduced large-scale facilities that integrate production and distribution based on transport conditions. However, this growth raises environmental concerns, including soil sealing and increased traffic pollution, resulting in significant landscape transformations. Therefore, this evolution is not just a multiplication of functional elements but an active agent of reshaping landscapes (Armondi et al., 2024) and with the research author would like to grounding this issue.

This paper examines land-use transformations along motorway corridors resulting from enhanced accessibility. These transformations arise due to improved mobility and increased land value when new linear infrastructures are established in rural areas. The analysis addresses three research questions:

1. Does the infrastructure contribute to the transformation of rural/agrarian spaces into accessible linear systems?
2. How do corridors evolve over time under new territorial pressures?
3. How the shaping of an operational landscape differs from a merely juxtaposition or sprawl of logistic functions?

The study aims to increase awareness of the role and impact of logistics functions in urban studies, contributing to innovative approaches in territorial governance at local and regional levels. It seeks to move beyond traditional methods focused on traffic analysis and soil consumption, incorporating social and spatial dimensions into the evaluation of logistics. Recent researches (among others: Paris et al, 2024) suggests that logistics platforms can drive territorial transformation and development of fixed capital in peri-urban and rural areas. However, mitigating the negative effects of uncontrolled logistics expansion, such as sprawl, is essential to achieving these benefits.

The research centers on the A35 BreBeMi motorway in the southern Province of Bergamo, Italy. This area, characterized by a rural, low-density plateau, has seen the development of several logistics platforms in recent years. After the inauguration in 2015, the area has become a hub for logistics, with multiple new facilities concentrated within 265 km². This growth aligns with increased attention to environmental and landscape concerns and shifts in urban planning paradigms toward sustainable land management.

This research is part of the project “SEW Line: Socio-Ecological Way for a Holistic Mobility Infrastructure Planning in Periurban and Rural Landscapes” developed by the University of Padua, Bergamo and Roma Sapienza within the research program PRIN2022 PNRR M4C2 funded by European Union –NextGeneration EU (DD MUR n. 1409 del 14/09/2022).

“I travel because I want to be well”: How daily travel contributes to older adults’quality of life in Canada

Authors: Ahmed El-Geneidy^{None}; Jonas De Vos^{None}; Meredith Alousi-Jones^{None}

Corresponding Authors: ahmed.elgeneidy@mcgill.ca, meredith.alousi-jones@mail.mcgill.ca, jonas.devos@ucl.ac.uk

Remaining independent, active, healthy, and mobile is essential for older adults’quality of life (Hooyman & Kiyak, 2010). However, older people’s ability to maintain their well-being as they age relies on a range of material and social factors (Hooyman & Kiyak, 2010). Research and practice have long focused on developing and implementing quality of life indicators with the goal of centering well-being in decision making (Abou-Zeid, 2009; De Vos et al., 2013; Ettema et al., 2011; Nordbakke & Schwanen, 2014). Tools and methods evaluating people’s subjective well-being have become increasingly popular in the past decades (e.g., Diener et al. (1985); Diener et al. (2010)), and travel is explored as one of the many dimensions that make up this evaluation of well-being (De Vos et al., 2013). This study uses the Aging in Place Survey to examine the factors influencing older adults’evaluation of the contribution of daily travel on their quality of life in Canada using a mixed-methods approach. The Aging in Place survey is an online bilingual survey conducted by the Transportation Research at McGill (TRAM) group. The survey gathers information on the travel needs and experiences of older adults (65 years and older) across six metropolitan regions in Canada, including Toronto, Montréal, Vancouver, Halifax, Victoria, and Saskatoon. Multiple recruitment strategies were employed to ensure a large

and representative sample as proposed by Dillman et al. (2014). Flyers were distributed at senior and community centers, the survey was advertised on social media and using senior center mailing lists, team members gave newspaper and radio interviews, and additional respondent recruitment was done through Léger, a market research and analytics company specialized in public opinion surveys. Data collection was completed in Winter 2023. The ordered probit model (N = 2,342) for agreement with daily travel contributing positively to their quality of life shows that agreement was higher among older adults who use public transit frequently, enjoy travelling independently, live in walkable areas, and are satisfied with their lives and physical health. In-depth interviews (N = 56) corroborate these quantitative findings and reveal additional considerations such as the importance of walking for mental and physical health, as well as the lasting impacts of the COVID-19 pandemic on older adults' travel-related quality of life. In addition to supportive physical and social environments, ensuring adequate transport options are available for their essential needs, leisure activities and the simple pleasure of travelling is key in enhancing older adults' quality of life now and as they age. The findings improve our grasp of older adults' conceptualization of their travel's impact on their quality of life. Though many of the quantitative and qualitative results echo each other, the thematic analysis adds important nuance to the probit model findings and uncovers new dimensions of older adults' daily travel and associated well-being, supporting the value of using mixed methods to address complex concepts. The results of this study could be of interest to policy makers and community leaders wanting to address the well-being of older adults.

Can On-Demand Transit Systems provide equitable public mobility services? A comparative study in two continents

Authors: Vanessa Stjernborg¹; Lena Hiselius¹; Subhro Guhathakurta²

¹ Lund University

² Georgia Tech

Corresponding Authors: vanessa.stjernborg@tft.lth.se, lena.hiselius@tft.lth.se, subhro.guha@design.gatech.edu

Sustainable mobility is intrinsically linked to the concept of spatial justice, which refers to the equitable distribution of resources, services, and access, often considered a fundamental human right (Soja 2010). Transport justice is vital to spatial justice, focusing on designing and developing equitable transport systems (Martens 2017). To attain sustainable mobility and transport justice, intensive work on new and innovative mobility solutions is ongoing worldwide. On-demand transit has shown great promise for improving flexibility and accessibility in public transport (Alonso-Gonzalez 2018). Today, on-demand solutions are a key component of future public mobility, where digital applications and seamless digital interfaces contribute to new opportunities for providing on-demand transit. Research, however, argues that there is often a lack of evaluation and follow-up of different initiatives and mobility solutions conducted in various contexts (Berg 2017, Stjernborg and Nilsson 2018). While on-demand transit is proven to increase transit accessibility significantly, its impact on transit equity and equality has been rarely addressed (Hwang, et al. 2024). This study aims to examine, compare, and learn from two On-Demand Transit solutions deployed in different urban and rural contexts on two continents: MARTA Reach in Atlanta and Plusresa in the region of Skåne in southern Sweden.

MARTA Reach was a six-month pilot of an On-Demand Multimodal Public Transit System (ODMTS) in Atlanta that began on March 1, 2022. The aim was to improve accessibility to jobs, healthcare, and healthy food while fostering an equitable and accessible transit system. MARTA Reach combined on-demand vehicles to serve the first/last miles, with high-frequency rail or bus routes to transport commuters on dense, congested corridors. Funded by an NSF CIVIC grant, MARTA Reach was a collaboration between researchers at Georgia Tech and the Metropolitan Atlanta Transit Authority (MARTA). MARTA operated the pilot by arranging for the shuttle fleet and drivers. The researchers at Georgia Tech developed the software technology and the user applications and maintained the backend server. The pilot program was deployed in four zones within Atlanta having distinct demographic characteristics to understand how the benefits of ODTMS would reach a diverse group of transit users.

Plusresa, which started in March 2021 in the region of Skåne, was conceived to provide public transportation for people living in rural areas. Skåne is the southernmost Swedish county, whose county town is Malmö, which is also the third largest city in Sweden. In 2021, Skåne had about 1.4 million inhabitants, with a population density of 124 inhabitants per square kilometer. The population is unevenly distributed, with the largest proportion living in the south-western part of Skåne. North-eastern Skåne, which is the focus of this study, is often noted for its natural resources and sparser habitation geography. The objective of Plusresa was to connect rural areas with major traffic routes with a focus on commuting for work and study, as well as leisure travel for a functional everyday life.

By taking advantage of experiences and reflections on the two solutions, this study aims to contribute to knowledge and strengthen the conditions for innovation within sustainable mobility. The evaluation will particularly focus on issues such as its impact on transit equity and equality, its potential for reducing social and spatial inequalities, and an assess how the needs and preferences of actual users were met. Methods include collection and analysis of documents and other material, interviews with stakeholders and other key persons involved in the two initiatives, and site visits.

The elephant in the room or how to live on Planet A in a post-car age

Author: Ammj Traore¹

¹ *Politecnico di Torino*

Corresponding Author: ammj.traore@polito.it

Car-oriented planning has not only shaped the built environment but has also profoundly influenced **societal norms**, normalising driving as the default mode of transportation. This pervasive narrative has led to well-documented consequences: sprawling effect, landscape fragmentation caused by urban infrastructure and transport network expansions, social isolation, limited public transport access, road rage, soil consumption, resource degradation, spatial **injustice**, a reinforced consumerist culture, air and noise pollution, and increased contributions to climate change, to cite but a few. The **market** and the powerful lobby of the automotive industry fuelled this narrative, inducing demand for car ownership and prioritising individual and spatially segregated mobility — car users could be considered as “flows of faceless ghostly machines”- rather than active participants in the urban fabric. The automotive sector’s scale fosters state-industry-labour **cooperation**, promoting stability but risking to prioritise industrial and economic stability over transformative mobility policies.

This article explores how to challenge this entrenched narrative in the current political and socio-economic environment, shifting towards more equitable planning paradigms. Since the 1920s-30s, driving and car ubiquity in everyday life for potentially anyone on Earth led to complete car accessibility, higher speeds, longer distances, mobility-oriented planning and comfort over community, walkability and liveability. Yet, this mobility model is neither socially necessary nor inevitable, even if it has often seemed impossible to disrupt. Additionally, the car is not defined merely by its physical properties but by the broader systems of provision and the categories that enable and reinforce its use. These **systems of frames** create specific affordances that shape choices. This is particularly evident in parking policies, for instance, which have often been reactive and operational—addressing issues only when they arise in specific locations —rather than being integrated into a systemic transformation of the urban environment. Since the last century, concepts, theories, and models of human-oriented planning have been developed, leading to the consolidation of measures such as planning standards, pedestrianisation of downtowns, walking and cycling networks, the institutionalisation of the concept of piazza, Limited Traffic Zones (LTZs), regulations on noise and air pollution, and parking management strategies aimed at discouraging car use and gain revenues for maintenance or investment in other transport sectors. Governance improvements facilitated compact urban development, echoing the naturally pedestrian-friendly environments of pre-car historic cities.

However, the growth curve of global car ownership has not yet plateaued; road networks are still expanding, although ownership of internal combustion engine (ICE) vehicles is declining. New spatial challenges, particularly for charging infrastructure, are required by the increasing adoption of electric vehicles (EVs) —battery electric vehicles (BEVs), plug-in hybrid electric vehicles (PHEVs), and hybrid electric vehicles (HEVs) - and all these types have different needs. Sustainable Urban Mobility Plans (SUMP) are adapting to promote walking, cycling, and public transport, but “**path dependence**” continues to reproduce problems originally associated with ICEVs, now translated to EVs. For instance, while EVs eliminate tailpipe emissions, they do not fully address non-exhaust pollutants, and the additional weight of battery packs exacerbates emissions (PM2.5) from tyre and brake wear, an issue that remains largely unregulated. Additionally, governments are offering incentives, e.g. tax breaks, free parking, and LTZ exemptions, increasing their accessibility and maintaining the persistent mono-functionality of roads and streets as car-dominated spaces.

This research contributes to planning discourse by emphasising the critical role of **narratives** in shaping the built environment, moving beyond the rigid notion of physical determinism. It proposes an approach to challenging deeply ingrained assumptions and fostering more equitable systems by shifting societal norms and values. The final section presents **holistic solutions** integrating land-use planning with long-term mobility strategies, supported by robust regulatory frameworks and proactive public engagement.

Interpretative challenges of car-dependency in peri-urban contexts. An experimental approach and policy implications

Author: Giulia Galbiati¹

Co-authors: Giovanni Lanza¹; Paola Pucci¹

¹ Politecnico di Milano - DASTU

Corresponding Authors: giulia.galbiati@polimi.it, giovanni.lanza@polimi.it, paola.pucci@polimi.it

In recent years, the transition towards sustainable and inclusive urban mobility models has emerged as a crucial challenge, especially in territories where car use is deeply rooted to the point of evolving into a dependency. Urban agendas and policy have long sought to rethink the role of private vehicular mobility in daily commutes against such dependency, moving beyond an approach solely based on traffic regulation and infrastructure development. Notably, concepts such as “accessibility by proximity” (Levine et al, 2019), often linked to the X-minute city model, emphasize alternative mobility options, intermodality, and infomobility platforms as pivotal in reducing reliance on private vehicles.

Despite these efforts, a weakness lies in the limited ability of such policies to reshape consolidated habits and mobility practices, particularly in highly car-dependent social and spatial contexts. Among those, peri-urban and low-density areas emerge as territories where car dependency often stems from necessity rather than choice, driven by factors such as insufficient public transport, limited shared mobility options, and dispersed services. Effective interventions against car dependency in these areas require innovative solutions addressing both choice and necessity-driven car use, rooted in a comprehensive understanding of the underlying determinants of car dependency.

However, investigating car dependency involves recognizing it not merely as frequent car use but as a process (Goodwin, 1995) wherein car usage reshapes spatial-temporal practices while generating new ones. This dynamic nature necessitates integrated qualitative and quantitative approaches to examine its determinants, outcomes, and related behaviors. While substantial research has been conducted (e.g., Sierra Muñoz et al., 2024; Fransen & Boussauw, 2022; Baehler & Rérat, 2020), much of it relies on quantitative metrics, overlooking the contextual, multidimensional, and processual aspects of car dependency.

Assuming that car dependency is not merely ‘a combination of high car use, high provision for automobiles, and scattered low-density use’ (Newman and Kenworthy, 1989, p. 124), this paper emphasizes the need to examine this phenomenon by recognizing which practices are enabled by automobile use, in which spatial contexts and under which socio-spatial conditions (Mattioli et al., 2016), which subjective and objective perceptions are related to car use (Jeekel, 2013) and which conditions related to market distortions may reinforce car dependency (Litman, 2014).

The following key research questions emerge: how can the processual features of car dependency in peri-urban areas, shaped by socio-spatial factors, individual habits, and preferences, be effectively addressed? What integrated and scalable approaches can be employed to analyze car dependency’s multidimensional characteristics in peri-urban contexts? How can this analysis inform innovative policies to promote non-car dependent mobility?

These questions are investigated in an Italian research project - RECAP (<https://www.dastu.polimi.it/prin-recap/>). The study, outlined in this paper, presents a transferable mixed-method approach to analyze car dependency determinants, outcomes and practices. The approach is tested in the Bassa Pianura Bergamasca (North Italy), a peri-urban area in Northern Italy marked by high car use due to settlement dispersion following large infrastructural and land use-related transformations. The results of the quantitative analysis of car dependency at the territorial scale combined with an accessibility assessment to daily services, reveal the diversity of situations within the same context, as well as correlations between settlement density, mixed-use development, service location, transportation availability. Building on these insights, the study conducts qualitative investigations at the local scale, involving stakeholders sharing their situated knowledge to discuss the feasibility of contextualized measures to promote intermodality and complementarity between private cars and other mobility options. This integrated methodology presented in the paper enhances understanding of the reasons behind car dependency in specific settlement conditions, offering a replicable framework to inform the design of targeted policy measures towards less car-dependent mobility in peri-urban areas.

T_03 MOBILITY (B) / 1251**Queer Mobilities: Experiences of Liveability in Barcelona and Implications for Urban Planning**

Author: Jerònia Cubells¹

Co-author: Oriol Marquet¹

¹ *Universitat Autònoma de Barcelona*

Corresponding Authors: jeronia.cubells@uab.cat, oriol.marquet@uab.cat

Planning liveable cities involves acknowledging that experiences in the public space are shaped by oppressions and privileges, such as those associated with gender and sexuality. By adopting a feminist and queer perspective, we investigate how sexual diversity affects mobility and, consequently, the access to the city and the well-being of LGBTIQ+ people. Central to this work is the participatory process involving 22 non-binary people and lesbian and bisexual women living in Barcelona.

Through in-depth interviews with people from the LGBTIQ+ community, we asked participants how they feel when walking through the city and what should change for them to feel better. In addition, interviewees drew a ReliefMap, a tool that captures their emotions in different routes and how these feelings intertwine with their unique combination of identities (gender, sexuality, racialisation and age).

Results reveal the emotional journeys of navigating the city as queer, shaped by intersecting oppressions -misogyny, lesbophobia, transphobia or racism- that influence their sense of safety and belonging. Despite experiences of disorientation and fear, participants also identified moments of joy and liberation, particularly when 'straight' paths were disregarded. Their insights suggest concrete pathways to 'queer' cities in order to

build places of greater comfort, visibility and care.

This study, focused on queer wayfinding and place-making, emphasizes the importance of participatory decision-making processes in urban planning. We contribute to the field by understanding of how LGBTIQ+ people navigate cities, often by uncovering new paths and senses of belonging, and propose directions to make their lives more live-able.

Exploring children's active commuting to school and associated social inequalities

Author: Catarina Cadima¹

Co-authors: António Ferreira¹; Kim von Schönfeld²

¹ *Research Centre for Territory, Transports and Environment (CITTA), University of Porto, Portugal*

² *Department of Civil Engineering, Western Norway University of Applied Sciences, Norway*

Corresponding Authors: cadima.catarina@gmail.com, acf@fe.up.pt, kcvschoenfeld@posteo.net

Driven mainly by the international decline in walking rates and the recognised health benefits of social and physical activity, research into children's active commuting to and from school has expanded rapidly in recent years. However, the role of parents' backgrounds, socioeconomic conditions, and perceptions of the neighbourhood environment in determining children's active commuting to and from school is not fully understood. We aim to summarise research on determinants and health consequences of children's active commuting to school. We used mixed methods in a sequential approach, starting with an online survey and then interviews with school directors and workshops with parents. The results emphasise the importance of previous cultural and personal experiences, parents' expectations, and their day-to-day lives. Recent social changes, such as housing access, declining birth rates, safety perceptions and increasing after-school activities, may change parental attitudes towards their children's mode of school travel over time. To improve walking to and from school, we believe that new co-creative approaches involving children and parents, stakeholders from health, urban planning and schools are needed to overcome these tendencies and prevent future inequalities.

Spatial and social justice “on the street” and “beyond the streets”: reflections on Barcelona’s superblocks

Authors: Gabriele D’Adda¹; Elisabetta Vitale Brovarone^{None}

¹ *Politecnico di Torino*

Corresponding Authors: gabriele.dadda@polito.it, elisabetta.vitale@polito.it

In the context of multiple and overlapping crises at a global level (e.g., ecological and climate change, socioeconomic crises, pandemics, wars), urban space has emerged as a place for experimentation with processes of transformation of city models, of how to live in and move through the city. Many cities have undertaken mobility-related experiments to promote a transition that, by limiting the use of cars in certain areas or neighborhoods, serve to free up and recover public spaces, allocating them to more diversified uses (walking, cycling, etc.) and activities (crossing, passing through, but also meeting and socializing).

Since 2016, Barcelona has also embarked on this path and the municipal government, through the super blocks model (superilles in Catalan, supermanzanas in Spanish), has developed and gradually expanded an experiment of tactical urbanism aimed at reducing traffic in certain neighborhoods of the city by creating zones with preferential pedestrian use. The explicit aim of the project is to recover public space and improve the air quality and health of the population. The super-blocks experiment, which started in the Poble Nou neighborhood and over the years has evolved and been extended to other areas of the city, has triggered opposing reactions and has been the subject of political and recently even legal struggles.

Starting as a theoretical premise from the debates and literatures on spatial justice the right to the city and the concepts of just streets, and considering the super blocks model as an experiment, also political, of constructing a model of mobility and of experiencing public space in a different way, this paper aims to investigate two issues:

First, it analyses the impact “on the street”, of the different versions and practical developments of the superblock model in terms of distributive justice intended as redesigning street spaces to serve all users –walkers, cyclists, public transport, and drivers.

Second, looking “beyond the streets”, it considers the possible side effects of the superblock model with particular attention on housing precarization and gentrification of the areas involved, and on the city as a whole. Through this twofold analysis we suggest that the experiments to build/develop more “just streets” –as the superblocks in Barcelona –should not consider “just the streets” and look beyond the streets to prevent the risks of rising housing costs –and therefore housing precarity –and gentrification.

The social impacts of urban sustainable mobility policies, case study of the East Bristol Liveable Neighbourhood (EBLN)

Author: sara melasecchi¹

¹ *University of the West of England*

Corresponding Author: sara.melasecchi@uwe.ac.uk

I am a third-year PhD student at the Centre for Sustainable Planning and Environments, University of the West of England (UWE), currently in the writing-up phase of my research.

This analysis sits at the intersection of mobility justice (Sheller, 2018)- which interrogates who gains or loses mobility privileges- and urban social justice (Marcuse et al., 2009), exposing the processes that exacerbate urban social exclusion under the guise of sustainability.

Using the Capability Approach (CA) (Nussbaum, 2011; Nussbaum and Sen, 1993; Sen, 1984, 1985, 1990, 1993) as a foundational theory, this research links the theoretical debate of the just transition with its empirical application in urban sustainable mobility. Empirically, it frames accessibility as a key capability (Vecchio and Martens, 2021) to look for mobility marginality-the condition of being unable to transform intermediary actions (i.e. transport policies) to individual benefits thus being at the margins of mobility.

As a case study, it examines the social impacts of the East Bristol Liveable Neighborhood (EBLN), an urban mobility scheme aimed at traffic reduction, air quality and driving emissions.

Through the analysis of approx. 85 documents, a Stakeholder Engagement phase and a substantial body of Primary Data generated through a year-long weekly Participant Observation exercise while volunteering at the neighbourhood's Community Centre and the Thematic Analysis of 30 semi-structured interviews (tot. n= 41) with different actors involved, the research contributes to the understanding of social justice in mitigation policies by giving voice to people directly involved and impacted by it, especially socially and economically vulnerable residents. The study creates a narrative of mobility marginality by assessing how the policy impacts different groups of people based on their resources, personal circumstances and consequent accessibility levels defined as the increased/diminished opportunity set available to individuals to achieve their desired functionings.

These findings raise urgent questions relevant to just transition and policymaking, such as the importance of place in decarbonization strategies, the issue of adaptive preferences and mobile commoning as a future sustainable urban transport strategy.

T_03 MOBILITY (B) / 824**Measuring inequalities in accessibility: how does destination choice matter?****Author:** Adam Radzinski¹¹ *Adam Mickiewicz University, Poznań***Corresponding Author:** adam.radzinski@amu.edu.pl

Measuring inequalities in accessibility is a common subject in transport research. Yet, the question of how the choice of destinations affects the results is seldom asked. The paper addresses this issue by providing an overview of existing literature and comparing accessibility to five categories of destinations typically considered in such analyses: education, jobs, healthcare, retail, and green areas. Four Polish second-tier cities — Kraków, Wrocław, Poznań, and Gdańsk — are used as case studies. For each category of destinations, accessibility scores are calculated taking into account three sustainable modes of transport: walking, cycling, and public transport. The scores are then compared to population distributions, and indicators of spatial autocorrelation are used to identify areas of insufficient accessibility. Results suggest that the degree of equity in accessibility distribution varies across categories of destinations. The share of vulnerable residents in low accessibility clusters was higher for retail and green areas than for education, jobs, and healthcare. While the results also vary across the investigated cities, it may be concluded that accessibility was more equitable for some destinations whose distribution relies more on the public sector (i.e., education) than for primarily market-driven destinations (i.e., retail). The proposed method can be useful in identifying areas of socio-economic vulnerability that require improvements in accessibility.

T_03 MOBILITY (B) / 342**Contextual Behavioural Factors into Active Transport Infrastructure****Author:** Sara Haider¹¹ *University of Sydney***Corresponding Author:** s.haider@sydney.edu.au

Active travel, including walking and cycling for transport, supports healthy, sustainable, and equitable societies. With growing populations, climate crises, and health concerns, active travel aligns with four United Nations Sustainable Development Goals: climate change, health, sustainable cities, and sustainable transport. In car-centric nations, authorities are investing in active transport infrastructure to encourage active travel. Despite these efforts, car usage in much of the developed world remains dominant.

Active travel behavior is shaped by utilitarian, psychological, and social factors, which compete with cars' perceived advantages such as time efficiency, comfort, safety, security, and societal norms. To encourage active travel effectively, infrastructure planning

and design is required to respond to the diverse travel needs and desires of individuals through infrastructure that prioritises context-specific behavioural factors aligned with individual attitudes and behaviours towards active travel.

This research examined how key behavioural drivers influence active travel across varying contexts, focusing on utilitarian factors (time, cost, distance), psychological factors (safety, comfort, security), and social factors (influence of social norms). Understanding these influential drivers helps identify active transport infrastructure attributes that best support behavioural values across different contexts.

Context including demographic and cultural characteristics as well as features of the natural and built environment, were found to affect individual active travel behaviours.

The research is conducted through a statewide survey distributed in New South Wales, Australia—a region characterised by diverse contexts such as remote low-density and highly dense urban areas with demographic diversity. The survey was distributed to 2000 participants with a representative sample split from regional and metropolitan geographical spread, gathered data on active travel patterns, attitudes, infrastructure awareness, user experiences, and preferences for infrastructure to promote uptake. The questionnaire was framed by the behavioural factors of utilitarian, psychological, and social factors that underpin active travel behaviour.

The findings highlighted relationships between contextual environments and active travel behaviour, revealing that different infrastructure solutions are effective depending on the area context. The development of a framework that integrates these contextual behaviour factors into active transport infrastructure design will facilitate place-based infrastructure strategies that optimize active travel adoption, fostering healthier, more sustainable, and equitable communities.

Determinants of individual mobility behaviour: how to influence the modal split of commuting in the Vienna city region

Authors: Hans Kramar¹; Selim Banabak¹

¹ *TU Wien*

Corresponding Authors: selim.banabak@tuwien.ac.at, hans.kramar@tuwien.ac.at

Sustainable transport is an elementary part of all climate change mitigation strategies. As one of the most prominent examples of climate-neutral efforts, the Green Deal of the European Commission explicitly strives for efficient, safe and environmentally friendly transport and mobility systems, in order to reach the goals of the Paris Agreement 2015. In that context, a research cooperation between the Austrian chamber of labour (AK Wien) and the Vienna University of Technology (TU Wien) was established in order to explore the individual choice of transport modes for daily commuting in the Vienna city region and to provide insights into the determinants and driving forces of the given modal split. On the theoretical base of current literature on mobility behaviour, a big survey

of more than 2000 commuters was set out to assess not only the actual choice of transport mode, but also requirements, limitations and reasons for these individual decisions. The results provide an interesting insight into the role of socio-economic characteristics (e.g. age, sex, education, branch of profession), local conditions (e.g. density, transport infrastructure) and the quality of transportation services (travel costs and efforts) on the decision-making of commuters, how to get to their place of work. Furthermore, the data were used to implement a complex statistical model (Bayesian Structured Additive Regression), which aims at identifying the explanatory variables of the modal split in commuter traffic. For that purpose, realistic travel times of actual commuter relations in 3 transport modes considered (car, public transport, active mobility) had to be calculated by means of a GIS-based multimodal routing system. In that way, it was possible to provide a satisfying empirical base for assessing the influence of different travel times on the individual choice of the preferred transport mode.

Both the empirical analysis and the model results indicate several interesting insights in actual mobility behaviour of people on their way to work. These results can easily be transferred into recommendations for sustainable, energy-saving and climate-friendly transport policies, which could potentially be applied not only in the Vienna region, but also in other metropolitan areas.

Modeling Access Ergonomics to Daily Life Resources using Sustainable Modes within the Eurométropole de Strasbourg

Authors: Clement Hacquard¹; Maxime Hachette²; Berk Celik³; Alain L'Hostis⁴

¹ *Université de technologie de Compiègne, Alliance Sorbonne Université, AVENUES*

² *Université de Technologie de Compiègne*

³ *Université de Technologie de Compiègne, AVENUES*

⁴ *LVMT, Université Gustave Eiffel*

Corresponding Authors: clement.hacquard@utc.fr, maxime.hachette@utc.fr, berk.celik@utc.fr, alain.lhostis@univ-eiffel.fr

Since the 1980s, many cities in Europe, including the Eurométropole de Strasbourg, have implemented policies to reduce transportation and mobility related negative impacts, especially those caused by individual cars. In the Eurométropole de Strasbourg, measures have been introduced to limit car use while promoting sustainable transport. This

includes developing public transportation, enhancing shared and active modes (walking, cycling) usage, and urban planning focused on a “proximity metropolis” model to support sustainable mobility.

Furthermore, the Eurométropole de Strasbourg has restricted motorized mobility, particularly internal combustion engine vehicles, by creating a Low Emission Zone covering its 33 municipalities. The city also supports energy transition, encouraging the adoption of electric vehicles including electric bikes through purchase subsidies.

The central question is how well the Eurométropole de Strasbourg enables its residents to access essential daily-life resources, efficiently, comfortably, and at low cost (financial cost, effort, risk, emissions, energy and time) while using sustainable transport modes. To address this, *spatial ergonomics* (Saint-Gérard, 2002) which studies the capacity for a territory to fulfil the needs of its inhabitants at least costs, and especially its subdomain *access ergonomics* (Hached, 2019) which provides an approach through mobility, offer a relevant analytical framework. This approach assesses accessibility while focusing on its conditions not only regarding travel duration but also considering daily-life resources and infrastructure quality (facilities, safety, comfort, environment) adapted to each transport mode.

The hypothesis is that a high-quality environment helps to promotes sustainable transport, especially for active modes. Mobility behaviors, including route choices, are influenced by safety, comfort, and environmental factors (Piombini, 2013). Access ergonomics integrates these factors into a synthetic access ergonomics score composed of several sub-indicators to identify socio-spatial inequalities in accessing daily resources.

Previous studies (Saint-Gérard et al., 2021) showed significant variability in access across the Eurométropole de Strasbourg; however, they did not consider emerging mobility forms, such as electric vehicles and micromobility. The rise of micromobility and intermodality requires adaptation of these analyses.

Activity-based models are used for evaluating accessibility through a trip completion rate by measuring the proportion of the trips below a certain threshold (Somranath et al., 2025). This approach however does not consider key parts of access ergonomics (safety and convenience of trips).

Our study aims to improve realism and precision in evaluating *access ergonomics*. A new methodology has been developed to overcome limitations from previous works. Multi-agent modeling is used to simulate mobility behaviors based on detailed socio-spatial profiles, considering diverse socio-economic and demographic data at a fine scale (200 × 200 m). These profiles are fed to a geographic information system to assess access conditions using various transport modes (active, shared, motorized, intermodal).

Trips are analyzed within activity chains, where each activity (work, leisure, services) can be interconnected. The model also considers resource availability and transport service schedules, identifying potential inconsistencies that impact *access ergonomics*.

The study relies on open geographic and statistical data covering the Eurométropole de Strasbourg. The synthetic population is generated using eqasim (Hörl and Balac, 2021), and user profiles are adjusted based on socio-demographic data and mobility surveys.

The goal is also to develop a tool which will generate an *access ergonomics* score for each inhabited grid square, providing a detailed and comprehensive view of socio-spatial inequalities. The synthetic score will be broken down into sub-indicators (travel time, safety, comfort, etc.) and transport modes, enabling comparison across the territory. These results will help to identify actions for improving *access ergonomics* and for reducing inequalities.

In further studies, the developed tool will be improved by considering the aspect of energy transition, especially to take its consequences into account on the *access ergonomics*.

Urban mobility lifestyles: exploring definitions, metrics, and emerging research directions

Author: Samira Ramezani¹

¹ Assistant professor, Department of planning and environment, Faculty of Spatial Sciences, University of Groningen

Corresponding Author: s.ramezani@rug.nl

The importance of lifestyle in predicting individual and groups of individuals' behaviours has been widely recognized across various fields, including transport studies, urban planning, and public health. Research on mobility lifestyles aims to inform interventions and policies that promote sustainable and health-conscious transportation choices in cities. Lifestyles shape mobility and transportation routines, influencing physical activity levels and the prevalence of certain health conditions. However, despite its significance, there is no formally agreed-upon definition, theoretical framework, or standardized methodology for measuring mobility lifestyles or policies/interventions that can encourage more sustainable/healthy lifestyles.

This study conducts a systematic literature review to examine the evolution of mobility lifestyle research, identifying key trends in definitions, measurement approaches, and research themes. The review highlights a shift from traditional transport mode choice analysis to a more holistic approach integrating underlying sociocultural, behavioural and psychological dimensions. Additionally, there is growing recognition of how mobility lifestyles intersect with broader issues of social equity and environmental justice including individual, social, and environmental barriers. Methodologically, studies have moved beyond simple segmentation approaches with sociodemographic data to include environmental and travel attitudes and residential neighbourhood preferences, the role of constraints, and big data analytics (to identify activity patterns). Despite these advancements, challenges remain in establishing a unified conceptual framework and integrating measurement techniques across different fields. This review identifies critical gaps in mobility lifestyle research and conceptualisation and calls for more interdisciplinary approaches that integrate environmental psychology, environmental justice,

advancements in mobility data analytics, and co-creative approaches is research and policy/intervention design to understand lifestyle and foster equitable and sustainable urban mobility transitions.

Assessing the Integration of Spatial and Strategic Plans in Sustainable Urban Mobility Planning: Insights from SUMP İzmir

Authors: Sila ÖZKAVAF ŞENALP¹; GÜLÇİN DALKIÇ MELEK^{None}; Ebru V. Öcalır²; Hediye TUYDES-YAMAN³

¹ *Parabol Yazılım*

² *Gazi Üniversitesi*

³ *Orta Doğu Teknik Üniversitesi*

Corresponding Authors: ebruocalir@gazi.edu.tr, htuydes@metu.edu.tr, gulcindalkicmelek@gmail.com, silaozkavaf@gmail.com

Sustainable Urban Mobility Planning (SUMP) is a comprehensive, data-driven approach aimed at improving urban transport systems through stakeholder engagement, evidence-based decision-making, and strategic scenario development. In Türkiye, SUMP projects initiated in cities of İzmir, Ankara, Kocaeli, and İstanbul, which not only included new modeling approaches, but also a thorough legislative investigation. İzmir SUMP projects stands out due to its pioneering activity-based modeling approach, and a detailed examination of policy documents and planning instruments to ensure a strong analytical foundation. This study, conducted as a part of the “SUMP İzmir Project”, evaluates the coherence between İzmir’s spatial and strategic plans and its sustainable urban mobility objectives, using the CIVITAS intervention areas as an assessment framework.

The methodology involves a detailed content analysis of the policies, and spatial and strategic plans that form the basis of İzmir’s sustainable urban mobility planning. These plans were evaluated for their alignment with 12 CIVITAS intervention areas, including active mobility, public transport, demand management, smart mobility, logistics, and environmental sustainability, as well as İzmir-specific priorities such as coastal planning and port integration. The results are presented in tables and schemes.

The findings reveal significant gaps in İzmir’s spatial planning concerning sustainable urban mobility. The findings from spatial plans can be summarized as:

- The 1/100,000 Environmental Regulation Plan (2014) acknowledges the connection between transport and urban expansion but lacks a structured approach to demand management and spatial planning that supports sustainable mobility.
- The 1/25,000 Metropolitan Environmental Plan (2012) was developed based on the Transportation Master Plan (2009) but fails to incorporate key aspects such as inclusive planning, active mobility, demand management, and urban space management. A limitation of this study is the lack of access to plans at the 1/1000 and 1/5,000 scales.
- Due to the existing planning paradigm, these numerous plans do not cover CIVITAS intervention areas as comprehensively as higher-level plans.

On the other hand, İzmir’s strategic planning efforts show stronger commitments to sustainable mobility. The findings are;

- The IMM Strategic Plan (2020-2024) promotes clean energy vehicles, cycling infrastructure, and public transport integration.

- The İzmir Green City Action Plan (GCAP, 2020) focuses on low-emission transport, sustainable logistics, and energy efficiency, while the İzmir Transportation Master Plan (TMP 2030, 2015) emphasizes rail network expansion and reduced car dependency.
 - Supporting action plans such as the Bicycle and Pedestrian Action Plan (2018), Parking Action Plan (2019), and Marine Transport Integration Plan (2019) reinforce multimodal transport solutions.
 - The İzmir Logistics Plan (LOPI, 2022) and the Sustainable Logistics Plan for the Historic City Center (2030) contribute to freight and last-mile delivery strategies.
- Additionally, climate-focused policies, including the İzmir Sustainable Energy and Climate Action Plan and the Climate Change Resilient Cities Framework (2019), provide long-term sustainability, and climate adaptation measures.

Even with these advancements, numerous challenges continue to exist:

- Many strategic plans function independently, resulting in fragmented implementation.
- Furthermore, there is a disconnect between national regulations promoting sustainable mobility and local implementation efforts.
- Public engagement mechanisms need further enhancement to better balance citizen participation with varying mobility needs.

In conclusion, İzmir's urban mobility framework reflects a strong policy commitment to sustainability; however, spatial planning remains misaligned with strategic transport objectives.

The study concludes with recommendations that may also contribute to the development of the SUMP methodology:

- Enhanced policy coordination is needed to align spatial planning with transport strategies effectively.
- Existing land-use and spatial plans at lower levels, along with population projections, are necessary to accurately capture current and future socio-demographic and spatial dynamics.
- The adoption of decision-support systems should be prioritized to inform policy and planning.

Planning for Play-Friendly City: Global Narratives and Local Interpretations in the Context of Istanbul

Author: Dzheyran Safet Karaulan¹

Co-author: Yasin Çağatay Seçkin¹

¹ *Istanbul Technical University*

Corresponding Authors: dkaraulan@gmail.com, cseckin@itu.edu.tr

The concept of a “play-friendly city” has emerged as a significant focus within contemporary urban planning and policy discourse, reflecting an increasing recognition of the pivotal role of play in fostering children’s development and overall well-being. While the promotion of spaces that encourage play and physical activity for children has gained broad global endorsement, the practical realization of play-friendly cities calls for a holistic approach, attentive to the specificities of local contexts, needs, and resource constraints. This paper investigates the global frameworks and narratives that guide cities in enhancing play and recreation opportunities for children. It analyzes key principles, shared objectives, and conceptual approaches, while also examining the diverse ways

these ideas are interpreted and applied across local contexts. The study puts an emphasis on the specific needs and conditions of different cities in the planning of playful urban environments.

The first section of the paper explores the theoretical and practical dimensions of planning for children and play. Child-focused urban planning entails the intentional integration of environments that foster physical activity, social engagement, creativity, and cognitive growth. Such efforts extend beyond the creation of parks and playgrounds to encompass a holistic, multifaceted approach that incorporates local services, fosters community cohesion, and strengthens the relationship between citizens and public spaces. The overarching goal of planning for play-friendly cities is to cultivate urban communities that prioritize children's needs, ensuring access to spaces conducive to healthy development, encompassing both structured and unstructured play, and supporting physical and mental well-being. However, achieving this vision requires cities to navigate the complexities of their unique socio-economic, cultural, environmental, and political conditions.

The second section addresses the global narratives and policy frameworks that direct the development of child-friendly urban environments. Specifically, the analysis highlights international policy frameworks that emphasize children's rights in urban contexts, with a particular focus on the right to play as a fundamental necessity. These frameworks advocate for urban spaces that enhance children's growth, safety, and well-being. Furthermore, the paper examines how different cities interpret and adapt global narratives of play to meet the specific needs of their populations. By analyzing local play plans, this section identifies common objectives, strategies, and actions, offering insights into the shared and context-specific approaches adopted by cities striving to become play-friendly.

The final section focuses on Istanbul's efforts to position itself as a "playable city", presenting an evaluative case study of the city's initiatives to implement a play-focused urban planning framework. The analysis highlights the commonalities and divergences between Istanbul's strategies and those employed by other cities, while examining the distinct socio-cultural and spatial characteristics that shape Istanbul's approach to planning for play. By situating Istanbul's experience within the broader discourse on play-friendly cities, this section underscores the interplay between global ideals and localized practices.

This paper, paralleled within an ongoing doctoral research, offers a comprehensive analysis of planning for play-friendly cities. By synthesizing insights from global narratives and local practices, it provides a deeper understanding of how urban environments can be planned, designed and managed to support the development of children, promote inclusive, vibrant, and sustainable urban spaces and communities. The study lays the groundwork for future research aimed at developing a decision-making model to assist local governments and communities in their efforts to create play-friendly cities.

Optimisation of non-motorised facilities in urban fringe sheltered housing areas: Transport Accessibility and Equity Enhancement Based on Supply and Demand Analysis

Authors: Tianxin Zhang¹; Mengde Zheng¹

¹ Xi'an University of Architecture and Technology

Corresponding Authors: 1653254667@qq.com, 2316724720@qq.com

As affordable housing expands to the urban fringe, remote locations and inadequate public transport support make it difficult for residents to travel. With long commuting

distances and sparse station distribution, non-motorised vehicles have become the main means of connecting to the metro or bus due to their economy and flexibility. However, the existing parking facilities are not planned to meet the demand, and the imbalance between supply and demand limits the travelling efficiency and quality of life, and increases the inequality in the distribution of transport resources.

The study focuses on the optimisation of transport accessibility and non-motorised facilities in urban fringe sheltered housing areas, exploring the reasons for the imbalance between the supply and demand of facilities and proposing optimisation strategies. Selecting Xi'an City's guaranteed housing projects as the research object, the study collects 473 valid samples by using a combination of resident travel surveys, typical case analysis and supply-demand relationship research methods, and analyses the residents' travel behaviours in combination with a Logit model. The study found that the non-motorised demand in the sheltered housing area is significantly higher than in other areas due to commuting distance and household income, with an average demand of 1.8 times the existing capacity. However, the construction of non-motorised parking facilities is lagging behind, making it difficult to meet the actual demand; at the same time, the utilisation rate of motorised parking spaces is less than 70%, and some of the resources remain idle for a long period of time, further exacerbating the inequity in the distribution of transport resources. This imbalance between supply and demand reveals the travelling preferences of low-income groups that are more inclined to rely on non-motorised vehicles and their intrinsic connection with the living radius.

To address these issues, the study proposes an optimisation strategy with the dual objectives of 'livability and equity': first, dynamically adjusting the number and layout of non-motorised parking facilities, with a focus on covering high-demand areas around public transport stations; second, introducing an intelligent management system to improve the efficiency of facility utilisation and management accuracy; third, strengthening the construction of public transport in remote areas to shorten residents' commuting time; and third, strengthening the development of public transport in remote areas to improve residents' living conditions. Third, strengthening the construction of public transport in remote areas to shorten the commuting time of residents; fourth, promoting policy support to transform some unused motor vehicle parking spaces into non-motorised parking facilities, and promoting the fair distribution of transport resources.

This study provides theoretical support and practical guidance for the planning of non-motorised facilities in urban fringe sheltered housing areas, and promotes the enhancement of transport equity and livability. The research results also provide a reference for housing and transport planning in other urban fringe areas, and have high promotion value. By optimising non-motorised facilities, this study provides feasible policy recommendations for achieving more equitable and livable urban fringe communities.

The Sustainability of Proximity: A Literature Review of the 15-Minute City

Authors: John Omwamba¹; Lucia Rotaris²; Giovanni Longo²

¹ *IUSS Pavia*

² *University of Trieste*

Corresponding Authors: lucia.rotaris@deams.units.it, john.omwamba@iusspavia.it, giovanni.longo@dia.units.it

The 15-minute city concept, pioneered by Carlos Moreno, aims to revolutionize urban sustainability by reducing dependency on private vehicles and promoting public transport, active and shared mobility. This paper evaluates the concept's effectiveness in reducing GHG emissions, improving air quality, and decreasing urban sprawl. Further,

it examines the concept's impact on social inclusion for children, students, the elderly, disabled, and non-drivers, and explores the model's implementation dynamics across diverse urban contexts. A systematic literature review was employed, analysing 55 relevant publications sourced from Scopus and Science Direct, using the PRISMA protocol. The papers were published between 2020 to 2024. The review highlighted reduction in CO2 emissions and vehicular usage in cities like Paris and Barcelona, attributing these reductions to enhanced cycling infrastructure, public transport networks, and strategic urban restructuring. The concept also addresses social equity by providing equitable access to services, though challenges such as the risk of gentrification of marginalised populations were noted. Furthermore, the integration of public and shared mobility solutions showed promising results in reducing car dependency and promoting sustainable urban living. However, the review identified specific gaps in the literature, including the long-term sustainability of emission reductions, socio-economic impacts of gentrification, effectiveness of shared mobility within the model, less research in resource constrained settings and the role of urban cargo transport within the 15-minute city framework. These gaps necessitate further research to understand the model's successful adaptation and implementation across diverse urban contexts. This paper serves as a reference for urban planners, policymakers, and researchers, offering evidence-based strategies and policy recommendations to advance sustainable urban development through the 15-minute city concept.

Sustainable Mobility in Coastal Regions: Challenges and Solutions from the MERCIE Project

Author: Anna Attademo¹

Co-authors: Bruna Vendemmia¹; Marica Castigliano²; Libera Amenta³; Maria Simioli¹; Michelangelo Russo¹

¹ *Department of Architecture, University of Naples*

² *Department of Architecture "Federico II" University*

³ *University of Naples Federico II, Department of Architecture (DiARC)*

Corresponding Authors: libera.amenta@unina.it, maria.simioli@unina.it, russomic@unina.it, anna.attademo@unina.it, bruna.vendemmia@unina.it, marica.castigliano@unina.it

The mobility crisis highlights the need to transition toward environmentally sustainable and socially equitable transportation systems. Over the past century, car-centric environments (Urry, 2004) perpetuated the illusion of accessibility while contributing to urban sprawl, resource consumption, and soil depletion. Dependency on automobiles exacerbates pollution while widening social inequalities (Sheller, 2018). Although it is recognized as a systemic problem, its impact on urban form remains a critical concern for planners (Boussauw et al. 2023).

Coastal and city-port regions, where global and local flows interact (Hein et al., 2023) face unique challenges that further complicate mobility systems. Water and land transport's interplay is often poorly integrated, while territorial morphologies heighten climate and hydrogeological risks (IPCC, 2021). These areas suffer from ecological vulnerabilities: biodiversity loss, water pollution, high-density residential and tourist settlements pressure. These factors contribute to heightened air pollution, unequal access to services, and degraded public spaces.

To address these challenges, the MERCIE project—Eco-Sustainable Models for Collaborative, Integrated, and Inclusive Urban Regeneration of the Land-Sea System—aims to foster sustainable mobility in coastal areas. Coordinated by the Department of

Architecture (DiARC) of the “Federico II” University of Naples and funded by the iNEST Innovation Ecosystem (NEXTGenerationEU), MERCIE identifies three goals: protect and restore biodiversity and ecosystems, ensure equitable access to territorial resources, and improve quality of life for all.

To achieve these goals, it develops a Collaborative Spatial Decision Support System (C-SDSS) demo, to facilitate decision-making processes for local authorities and public entities, supporting the sustainable transformation of territories through targeted interventions. By leveraging quanti-qualitative spatial data (citizen-science approach), the platform enables users to co-design scenarios, exploring impacts of different decisions on mobility and land-sea interface regeneration (Geertman et al., 2013). Quantitative data are derived from spatial analyses, official databases, mapping, and statistical surveys on modal share, user flows and travel times. Qualitative data, meanwhile, are developed using psychometric constructs to assess factors such as attitudes toward active mobility, the influence of perceived risk on transport choices, and the role of heritage in shaping mobility patterns. These qualitative insights are further enriched through co-exploration activities in Urban Living Lab (ULL) workshops (JPI Urban Europe, 2015), also with the involvement of local public administrations and transport management. Then, a co-design phase ensures that diverse stakeholder perspectives are integrated into the decision-making process.

MERCIE focuses on the case study of Campi Flegrei, the coastal western part of the Metropolitan Area of Naples, South Italy. This area presents a compelling case study due to its rich natural and cultural heritage, its exposure to environmental risks (most recently the bradyseism crisis which came to worldwide attention), and its dense urbanization. Campi Flegrei features a variety of hydrographical systems (sea, lakes, rivers), as well as diverse coastal typologies. It also serves as a nexus of multiple transport modes: public and private systems, railways, and waterborne routes to the islands of Ischia and Procida. The region's complexity makes it ideal for testing the methodology and exploring its potential for sustainable mobility planning.

This paper presents the preliminary findings of MERCIE and discusses the challenges associated with transferring the proposed methodology to other coastal areas. While the case study highlights the potential of the C-SDSS to address complex mobility issues in sustainable and inclusive manner, its broader applicability will be useful in knowledge and technological transfer to account for the unique characteristics of different coastal regions, after due validation and site-specific adaptation.

By addressing mobility through an integrated, collaborative, and mixed data-driven approach, the MERCIE project underscores the transformative potential of sustainable transportation systems in coastal regions to support multi-stakeholders' decision making processes.

Big Data Analysis of Pedestrian traffic in Boulevards vs. Other City Streets

Author: Avital Angel¹

¹ *Technion Israel Institute of Technology*

Corresponding Author: avital346@gmail.com

Boulevards are widely recognized as urban features that encourage pedestrian movement due to their walkable design. However, despite their perceived role as pedestrian corridors, empirical evidence supporting this notion through actual pedestrian count data remains scarce. This study addresses this gap by leveraging mobile app-derived pedestrian data collected over time in Tel Aviv, Israel. The research examines pedestrian volumes in boulevards compared to other streets, considering temporal variations. The analysis is conducted at multiple spatial scales: city-wide analysis, neighbourhood-level analysis, and a detailed street-segment evaluation. Findings indicate that, at the city-scale, boulevards experience higher pedestrian volumes on weekdays, while weekend patterns show no significant differences across most seasons. The temporal role of boulevards within their immediate context varies; some consistently function as major pedestrian pathways within their neighbourhood, whereas others do so only during specific times, such as seasonal or weekly variations. In contrast, certain boulevards exhibit pedestrian volumes similar to or lower than adjacent streets. An examination of street attributes in boulevards with positive vs. negative association with walking compared to other streets reveals that physical characteristic and network centrality measures have a stronger association with street-level pedestrian volumes than land-use configurations. The study's insights highlight boulevards' dynamic role and the need for urban planning strategies adapted to local conditions and scales.

Proxies for walkable urban design - three case studies in Lodz, Poland

Author: Malgorzata Hanzl¹

¹ *Lodz University of Technology*

Corresponding Author: mhanzl@p.lodz.pl

The ongoing debate on urban walkability features three primary perspectives (Forsyth, 2015). The first approach focuses on critical conditions of pedestrian environments, including accessibility and connectivity (Alfonzo, 2005; Moudon et al., 2006; Ewing & Cervero, 2010), traversability (Dovey & Pafka, 2020), compactness, safety (Buehler & Pucher, 2017; Lo, 2009) and inviting environment (Southworth, 2005; Moudon et al., 2006). The second group of research focuses on walkability goals, which are health, liveable and social environment or resilience. The third approach, particularly relevant to urban design purposes, aims to define proxies for normative design applications. The characteristics and scale of the environment, along with the research objectives and analytical methods, determine the specific features that researchers choose. Various contextual factors make establishing a universal standard for design attributes that facilitate walkability impossible. The actual collection of features enabling walking depends on the type of environment. The characteristic sets usually differ for central city areas, surrounding residential multifamily estates, and peri-urban areas.

In the current study, we aim to compare the discrepant conditions to define sets of features specific to the three types of urban contexts. To do this, we conduct in-depth analyses of walkability in three neighbourhoods in Łódź, Poland: central mix-use urban location, peripheral multifamily residential and peri-urban historical village.

Evaluation and Optimization of Public Service Facility Accessibility in Planning Future Community Living Circles: A Case Study of Yangpu District, Shanghai, China

Author: Su Wang¹

Co-authors: Yuchen Wang²; Shangwu Zhang²; Jianzhong Huang²

¹ *Tongji University*

Corresponding Authors: 3235987330@qq.com, wyc04042022@163.com

Contemporary urban development is gradually shifting from “incremental expansion” to a high-quality development model characterized by “stock optimization” and “people-centered” approaches. The concept of the “Future Community Living Circle” has garnered widespread attention, focusing on meeting residents’ diverse and personalized daily needs and enhancing life satisfaction through the meticulous provision of public service facilities. However, traditional residential planning based on the “per thousand population” metric often exhibits issues such as single functionality, facility shortages, and extensive spatial layouts. As urban social spatial differentiation and social segregation intensify, the quantity and quality of community public service provision struggle to meet residents’ demands for equity and satisfaction, notably reflected in significant disparities in accessibility.

Against this backdrop, the evaluation and optimization of public service accessibility for “Future Community Living Circles” have become critical topics. Internationally, the concept of accessibility encompasses rights accessibility, opportunity accessibility, spatial accessibility, and usage accessibility, with research expanding from “health care accessibility” to “social public service accessibility.” Methodologically, studies frequently employ the Two-Step Floating Catchment Area (2SFCA) method, questionnaire-based satis-

faction surveys, and the 5A framework, alongside the rise of interdisciplinary research that emphasizes the integrated planning of facility layouts from regional, spatial, and people-centered perspectives. However, existing research predominantly focuses on the quantitative supply of public service facilities and the measurement of accessibility, insufficiently exploring whether facility configurations align with residents' daily activity trajectories and travel habits, as well as lacking classification studies on the differentiated needs of various population groups (e.g., different age groups, social strata). Consequently, when assessing whether public service provision accurately meets residents' needs, it is challenging to comprehensively represent the fairness of public service facilities across different groups in terms of activity timing, travel modes, and usage preferences.

Addressing these gaps, this study takes Yangpu District in Shanghai, China, as a case study to evaluate and optimize the accessibility of public service facilities within the "Future Community Living Circle" framework. Incorporating a "place-based and people-centered" research perspective, the study utilizes Mobile Signaling Data, Points of Interest (POI) data, and survey data to construct a comprehensive, multidimensional accessibility analysis framework encompassing the entire "supply-service-feedback" process. In designing the evaluation indicator system, this research considers the usability dimension—whether the number of facilities matches the population size of different age groups—and the accessibility dimension—whether facility layouts facilitate convenient travel for various age groups. Additionally, the adaptability dimension incorporates the alignment with spatiotemporal behavioral characteristics and residents' satisfaction. Based on these dimensions, the study synthesizes the accessibility levels of each research unit, aiming to precisely assess the alignment between public service provision and the needs of residents across different age groups and to propose optimization strategies.

The findings reveal that, from a "people-centered" perspective, different age groups exhibit significant variations in facility needs, manifested in aspects such as facility operation and maintenance, types, and functionalities. From a "place-based" perspective, uneven spatial distribution of facilities leads to disparities in quantity, location, and quality. Integrating the comprehensive accessibility analysis, this study establishes an "identify-optimize-enhance" system to recognize different regional types and propose targeted optimization strategies. These strategies aim to precisely match public service facilities with residents' needs, enhance overall accessibility, and promote the high-quality development of "Future Community Living Circles."

Multiple intra- and inter-city rail-based services in India

Author: Chandrima Mukhopadhyay^{None}

Corresponding Author: cmukhopadhyay22@gmail.com

The study investigates how do the multiple modes of intra- and inter-city rail-based services (in India) take safety, green, cleanliness, and inclusivity of public transports into consideration through its planning and design and to what extent these objectives are met. Technical, financial and institutional perspectives are considered. The study also asks how these modes contribute to public health (air pollution, contagious disease), climate change (mitigation, adaptation and resilience), pandemics (social distance, hygiene) and other disasters.

The indicators are as follows including the hard and soft infrastructures, in terms of planning, implementation and maintenance:

- Safety: Speed control, Injury, Crash, sexual safety for women, Safety inside the vehicles and at the stations
- Green: Cleaner form of fuel including the use of renewable energy
- Cleanliness: Pandemic driven factors like social distance, hygiene, both inside the vehicles and at the stations
- Inclusivity: SDG5 and SDG11, for all genders, age groups, including people with special needs, taking individual need into consideration.

Multiple public transport modes that are taken into consideration are Intra-city metro rail, Electric intercity rail (e.g. Shatabdi Express- poor peoples' infrastructure), Semi high-speed rail (HSR) (e.g. Vande Bharat), Double decker rail, Delhi-Meerut Regional Rapid Transit System (Namo Bharat), and Hydrogen train (1200 HP). The study will use methods such as document analysis, semi-structured interviews, media report analysis and survey. In Design guidelines/ Document analysis, one report from each type; supported by semi-structured interviews with designer and/or planners, with construction companies and operators on procurement side, with users on benefits reaped side. In media report analysis, recent media reports will be studied on each type for a period of six months (considering these are very new kind of projects mostly under construction). If possible, some surveys will be carried out amongst users.

² Delft University of Technology

Corresponding Authors: 2410328@tongji.edu.cn, linjunting@tongji.edu.cn, enshanchen@foxmail.com

With the rapid development of global transportation infrastructure, station areas have become critical nodes in multi-scale transportation networks. However, research on the impact of multi-scale accessibility on functional configuration and development intensity in station areas remains insufficient. This study employs multi-centrality analysis to quantify the positional characteristics of station areas within regional railways, metropolitan railways, urban transit, and urban road networks. Using the Vlinder Model illustrates the hierarchical node-place characteristics of 18 European station areas. Regression analysis is conducted to reveal the mechanisms by which multi-scale accessibility features influence the functional configuration and development intensity of station areas. The findings indicate that macro-accessibility represented by regional rail networks has the most significant impact on functional configuration, while micro-accessibility represented by urban road networks has the greatest influence on development intensity. This research provides new theoretical insights and empirical support for the planning and development of station areas.

An Exploration of Route Synergy between Attractions in Xi'an's Main Urban Area Based on the Node-Place Model

Author: Wendi Dong¹

¹ *Xi'an University of Architecture and Technology*

Corresponding Author: 990306dd@xauat.edu.cn

The People's Republic of China is currently experiencing a period of high-quality, intensive urban development. It is imperative that the relationship between the transport value and tourism value of routes between attractions is given full consideration in order to ensure the efficient use of tourism resources. Xi'an, the capital city with the longest history, the largest number of dynasties, and the greatest influence in Chinese history, possesses a very high historical and cultural status and rich cultural heritage, and attracts a large number of domestic and foreign tourists to and from the city every year. This paper selects 120 public transport link routes between 15 attractions of the 4A standard in the primary urban area of Xi'an City as the object of study. It employs six indicators: attraction density, featured shop density, and the number of travelogues published on travel platforms concerning visitor experience on the ArcGIS platform. It also employs road network density, bus and metro station density, density, and density of time-consuming public transport between attractions of road connectivity to carry out the analysis of the least resistance, and quantifies them after the Max-min standardised processing, the establishment of node-place model and further analysis of the correlation between the traffic value of the line between the attractions and the tourism value of the attractions, to evaluate the development status of each line. The results of the study demonstrate a phenomenon of non-synergistic development of each route, with the traffic and tourism development of the scenic spot divided into four states: balance, subordination, pressure and imbalance, with the number ratio of 8:1:1:5. For each of these states, the study puts forward a corresponding set of differentiated development strategies. In the case of the 'balance' state, the strategy is to maintain the coordinated development of the same increase and decrease in value. In the 'subordination' state, the strategy is to improve the traffic and tourism facilities. In the 'pressure' state, the strategy is to optimise the balance between traffic diversion and tourism carrying capacity. In the 'imbalance' state, the strategy is to optimise the value structure of the scenic spot. The overarching aim of the study is to integrate transport and tourism facilities in the city. The study provides a foundation for integrating the city's development in transport and tourism, and for enhancing the organisation of public transport between scenic areas.

Hydraulic and regional planification in the Tigris and Euphrates basin : a complicated process facing geopolitical constraints

Author: Marcel Bazin^{None}

Corresponding Author: marcel.bazin@numericable.fr

The basin of these two rivers, tributary to the Persian Gulf through the Shatt el-Arab, is one of the three large fluvial systems along the « arid diagonal » of the Ancient World, between those of Nile and Indus. They all allowed massive transfer of water towards arid plains and thus, together with China, the development of the oldest states. After a quite long and eventful history, this hydrographic basin has been divided between four states by the treaty of Lausanne (1922) : Turkey, Iran, Syria and Iraq, soon after the discovery of oil-fields.

As Turkey and Iran control all the upstream mountainous part of the basin, they could seem to have a dominant position, but the renewal of hydraulic structures has begun downstream, firstly by regulation dams in Lower Iraq (Hindiya on Euphrates 1918, Kut on Tigris in 1939). Then every country has developed its own multipurpose regional planification, such as the Dez Irrigation Project promoted by the Shâh of Iran inspired by the example of Tennessee Valley Authority, or the Tabqa dam built on Mid-Euphrates course by Hafez el-Assad with the help of USSR. The latter included a geopolitical objective : the government tried to transfer the inhabitants of flooded villages towards new settlements along the north-east frontier in order to create an « Arabian belt » between Kurdish populations on both sides of it, with a limited result.

The most ambitious project was then set by Turkey on the upstream course of both rivers since 1977, the South-East Anatoly Project (Güneydoğu Anadolu Projesi = GAP) : a program of 22 dams would allow the irrigation of 1 800 000 ha, the electrification of settlements and industries, the development of major regional cities and a better integration of Kurdish population, just at the time when the revolt of the Workers' Party of Kurdistan (PKK) began. This program included also many preventive archaeological excavations.

The four governments have thus led almost independently their own hydraulic and regional planification programs, in spite of a few attempts to coordination, such as the 1980 Turkey-Iraq protocol of cooperation, extended to Syria in 1983. The latter used different means of pression to obtain in 1987 a minimum flow of 500 m³/s. during the filling of the Atatürk reservoir dam. Another protocol shared the water received from Turkey : 42 % for Syria and 58 % for Iraq.

A last episode brought a severe alteration to perspectives of cooperation : the proclamation of an « Islamic State in Iraq and Levant », alias Daesh, in april 2013 and the auto-proclamation of Abu Bakr al-Baghdadi as Caliph in june 2014 in Mossul, creating thus a « Caliphate of the two Rivers » between its metropolis Mossul on Tigris and its capital in Raqqa on Euphrates. It was gradually recovered until 2019, but the fall of Bashar el-Assad in december 2024 has left a situation of instability threatening all the planification processes in this region.

Cross-Scale Transactions and Multi-Level Governance on Spatial Gains of Commons: A Comparative Study from Türkiye

Authors: Gülşah Tırış^{None}; Hilal ERKUŞ^{None}

Corresponding Authors: hilalerkus@yahoo.com, gulsahtiris7@gmail.com

Crises and conflicts at different spatial scales have some planetary consequences. Interventions on commons spaces (state or private sector) have increased with the acceleration of privatization policies in 2008, and debates on the commons theory have re-entered the agenda. The struggles on the commons offer a new perspective of space and a new ontology of politicization in the creation of this new path as an alternative. Constructing alternative multi-scale governance models can be a solution for spatial conflicts and crises emerging from planetary urbanisation (Brenner and Schmid, 2014). Therefore the most important pathway to create innovative solutions for spatial crisis is representing roles of different actors at different scales on the processes of spatial and political gains achieved through social movements. This study examines the multilevel governance and (upward and downward) scaling of on the commons (urban, systems and natural) by comparing different cases from Türkiye after 2008 crisis and afterward. Therefore, firstly a media search was carried out between 2008 and 2023 in digital newspaper archives. Different perspectives (liberal, right-wing, left-wing) were included in scanning newspapers and keywords such as “protest, struggle, urban movement and environmental action” and synonyms like “resistance, action, activism” were searched for defining our cases. As a consequence, the scans have led to several successful and influential movements that have shaped public sentiment. These include: Validebağ Grove; Kazdağları; Çeşme Tourism Project; Gerze Thermal Power Plant; Düzce Hope Houses Cooperative; Alpu Coal Thermal Power Plant; and BÜKOOP Consumer Cooperative’s Co-operative Movement for the spatiality of food. In total, 125 in-depth interviews were conducted with locals, experts (planners, lawyers, academics, architects, doctors, engineers), NGOs (local, national, regional, global) and local governments involved in and supporting these movements between 24 April and 28 May 2024. The data were analysed by using an interpretive approach.

Findings on our cases have shown that the movements are firstly initiated by local level actors, then by national actors supporting throughout the spatial gain process. At the local scale, local people, local NGOs, and local governments (such as provincial-district municipalities and village-neighborhood heads) are typically considered the primary drivers of social struggle. At the national level, the support of professional chambers and national NGOs are particularly prevalent. An exception, the social movement in Kazdağları emerged from a regional actor’s opposition to long-standing mining activities in the region, underscoring a distinctive down-ward scaling with local NGO’s and up-ward scaling with Global NGO’s as a case for multi-level scaling. In instances where local government support was found to be robust, such as in Gerze and Alpu, success was attained more expeditiously. While up-ward scaling was observed in these areas, gains were also made, and the presence of global actors during and post-gains underscores the interplay between up-ward and down-ward scaling across multiple levels. The achievements in the cases of Validebağ, BÜKOOP, Düzce, and Çeşme show a more bottom-up scaling. Considering the views of the actors in these spaces where gains have been made, it has been determined that the interaction between different levels of scales is much higher today, and therefore shows a need for multi-level forms of governance. The main success factor of these movements, which created a new alternative to planetary urbanization processes, is that they reclaimed and shared space through cross-scale interactions and multi-level governance.

Transnational Knowledge Flow: Evidence from Chinese Planning Scholars’ Involvement in International Conferences

Authors: Ronglu Yang¹; Kang Cao¹

¹ *Zhejiang University*

Corresponding Authors: k_cao@126.com, luy395641@gmail.com

The transnational flow of planning knowledge has gradually become a research hotspot since the late 20th century against the trends of the globalization of planning and EU integration. Various interdisciplinary terms have been used to describe this phenomenon, such as “cross-national learning” and “policy mobilization” in politics study, and “knowledge flow” in management study. Some findings focus on the actors and their activities involved in the transnational knowledge flow. It is specifically highlighted that planning scholars, as the main actors and most direct participants, often disseminate their planning knowledge through academic activities like conferences, lectures, exhibitions, and competitions.

There has been an increase in terms of the number of scholars and the degree of involvement in international academic activities among Chinese planning scholars since China proposed the “Belt and Road” initiative in 2013. Attending international conferences is one of the key academic activities that effectively promotes the transnational planning knowledge flow. Against this backdrop, our research examines Chinese planning scholars’ involvement in international conferences, aiming at exploring the content and influential factors of transnational knowledge flow. Employing data crawling and natural language processing techniques, we collect and analyze two types of data. 1) A mandatory requirement was released by the Chinese Ministry of Education at the end of 2015, entitled “Information Disclosure on Temporary Official Overseas Trips”, which stipulated that an official announcement should be released online on each international academic activity made by Chinese scholars. In terms of this requirement, we search the websites of universities with urban planning programs to gather data on scholars’ attendance in international conferences. 2) We search for keywords in the Web of Science, specifically the Conference Proceedings Citation Index, to collect international conference papers published by Chinese planning scholars between 2016 and 2024.

Based on the data above, our research explores the content of knowledge dissemination, its regional distribution trends, and the influential factors during scholars’ involvement in conferences. The data analysis shows that Chinese scholars disseminate planning knowledge on many topics or issues, including natural resource management, rural governance, regional development planning, digital city construction, and cultural heritage preservation, among others. Furthermore, the transnational knowledge flow has clear regional characteristics: neighboring countries in the Asia-Pacific region are the primary areas for knowledge dissemination, followed by the United States and Northwestern Europe as the secondary regions. In addition, factors such as planning formulation, changes in national development strategies, shifts in academic trends, and economic changes have all impacted the transnational knowledge flow. Our research also reveals that although there has been some progress in the transnational flow of Chinese planning knowledge, it still faces numerous challenges, including cultural differences, language barriers, and policy differences between different countries. The findings offer useful insights for European scholars studying planning policies and practices related to European knowledge spillover and EU integration.

Enhancing Resilience in Agrucultural Water Management: A Social Network Analysis Approach to Identify Leverage Points for Climate Adaptation

Authors: Ana Escario Chust¹; Oscar M. Blanco Sierra²

¹ *INGENIO (CSIC-UPV), Universitat Politècnica de València*

² *INGENIO (CSIC-UPV), Universitat Politècnica de València*

Climate change poses major challenges to water management and agricultural sectors across Europe. Floods, drought and water pollution require the development of resilient governance structures. In the framework of the FARMWISE project, funded by the Horizon Europe programme, this study aims to analyze the resilience of actor networks within eight European case studies (CS) —Italy, Poland, Spain, the Netherlands, Finland, Sweden, United Kingdom and Ukraine —in the realms of water management and agriculture. The primary objective of this research is to identify leverage points within each network that can be targeted to strengthen their resilience against the adverse effects of climate change.

To do so, this research integrates Social Network Analysis (SNA), Leverage Points (LP), and resilience theory to comprehensively examine network dynamics. SNA serves as the methodological foundation, enabling the mapping and quantification of relationships within actor networks through techniques such as centrality measures, cohesion analysis, and cluster identification. These methods reveal structural attributes that either enhance or impede network resilience. Resilience theory is applied to evaluate the networks' capacity to absorb shocks, maintain functionality, and transform in response to environmental stresses. Additionally, the concept of LP, inspired by systems thinking and Donella Meadows' framework, is utilized to pinpoint specific nodes or relationships within the network that are strategically important for boosting resilience. These LP represent areas where targeted interventions can significantly improve the network's ability to adapt and recover from climate-induced disturbances. The interplay between SNA, LP, and resilience theory allows for a holistic analysis, identifying both structural weaknesses and critical areas for strategic enhancement to strengthen overall network resilience.

The methodology used for the research, encompasses both quantitative and qualitative approaches to ensure a robust analysis of network resilience. To achieve the research objectives, a digital tool was developed, in collaboration with TU Darmstadt. This tool, named COSMIC - Collaborative Stakeholder Mapping of Interactions and Collaborations - facilitates the visual mapping of actor networks through a structured survey, enabling the collection of essential data required for Social Network Analysis (SNA). The digital tool allows for the systematic identification and visualization of interactions among stakeholders, providing a comprehensive overview of each network's structure and dynamics. In addition to the quantitative mapping, qualitative data collection methods are employed to enrich the analysis. To do so, interviews have been conducted with the leaders of each CS to gain in-depth insights into the functioning of their respective CS stakeholder's networks. These interviews aimed to validate the information and provided context to the quantitative findings. Furthermore, focus groups with various stakeholders have been organized to validate and triangulate the information obtained from the surveys and interviews. This participatory approach (1) ensures the accuracy and reliability of the COSMIC tool and the identified LP, (2) validates whether the sample is sufficiently representative of each territorial agrosystem and (3) fosters a collaborative environment where stakeholders can already actively contribute to the strengthening of their networks.

The research is a work in progress, but the expected outcomes include detailed maps of actor networks within the selected European CS, highlighting structural characteristics that influence their resilience. The study aims to offer actionable recommendations for policymakers and practitioners seeking to fortify these networks against the impacts of climate change. The developed digital tool represents a scalable and replicable approach that can be applied to other regions and sectors, promoting informed governance strategies that enhance network resilience.

Industrial Transformation and Upgrading of Small Towns and Regional Collaborative Development: A Case Study of Zhili Town, China

Author: Hsu Ching Yueh¹

¹ *Tongji University*

Corresponding Author: hsuyuehyueh@gmail.com

Research on industrial transformation and collaborative development in small towns has garnered increasing attention against the backdrop of Chinese-style modernization. However, most existing literature focuses on medium- and large-sized cities or the transformation of traditional rural areas, lacking a systematic investigation of industrial evolution and collaborative approaches in small towns confronted with global crises and regional imbalances. Currently, the Chinese government places high importance on coordinated regional development and optimizing urbanization's spatial resources. Small towns, with potential advantages in accommodating industrial spillovers, absorbing labor mobility, and reshaping space innovatively, warrant further study on their transformation processes and pathways.

The rise and spillover of the children's clothing industry in Zhili Town, Huzhou City, China, provides a typical case for examining how small towns achieve economic growth through industrial upgrading, relocation, and regional collaboration. This study focuses on several scientific issues: (1) the processes of industrial clustering and relocation in small towns; (2) the roles of government and collaborative mechanisms among multiple stakeholders; (3) labor market disparities and social sustainability; and (4) the outcomes of coordinated regional development.

Using Zhili Town and its primary relocation recipients as the core case, the research was conducted at two levels. First, based on spatial distribution data of the children's clothing industry, local statistical yearbooks, and policy documents, it systematically analyzes the scale, land-use patterns, and economic contributions of the industry's progression from early clustering to subsequent spillover, identifying drivers of upgrading and relocation pathways. Second, through interviews, surveys, and roundtable discussions with multiple stakeholders, the study delves into the interactions and negotiations among governments, enterprises, village communities, and migrant labor groups during the relocation process, summarizing the socio-economic attributes and governance structures underpinning the industry's transformation.

The study findings indicate the following:

- (1) Under early market reforms and government policy support, Zhili's children's clothing industry rapidly clustered and relied heavily on a non-local labor force. As fire safety issues and spatial carrying-capacity pressures intensified, the local government implemented a "replacement of old, introduction of new" strategy and promoted industrial park development, creating an effective context for upgrading local industrial structures.
- (2) Relocated industries primarily moved to less developed regions, forming a cross-regional division of labor known as "front shop, back factory." Although this injected capital and technology into inland areas—boosting employment—it also increased reliance on coastal markets and investments, highlighting the need for more comprehensive supportive policies at the local level.
- (3) Mechanisms of labor commodification and decommodification differ across regions,

leading to varying outcomes for migrant workers concerning welfare, income, and flexible employment needs, thus posing new challenges for social services and governance capacities in small towns.

(4) Local governments act as comprehensive coordinators for spatial planning and industrial policy. By enhancing quality inspection centers, encouraging digital trade and brand-building, and establishing cross-regional cooperation platforms, they seek to cultivate the industrial vitality of small towns within urbanization processes and reinforce social equity and sustainability.

This research qualitatively explores how small towns can achieve balanced and high-quality regional growth through industrial transformation and collaborative relocation amid global crises and regional inequalities. Its conclusions deepen the understanding of small towns' socio-economic resilience and spatial restructuring in the "post-growth" era, offering practical policy guidance on planning, industrial cooperation, and labor governance. They also provide significant insights for the global study of innovative small-town development and regional collaboration.

Territorial Governance across borders -the Example of the Greater Region

Author: Beate Caesar¹

Co-authors: Karina Pallagst¹; Benjamin Blaser²

¹ University of Kaiserslautern-Landau (RPTU)

² Regionalverband Südlicher Oberrhein

Corresponding Authors: karina.pallagst@ru.rptu.de, beate.caesar@ru.rptu.de, blaser@rvso.de

Spatial planning, understood as "measures [taken] to develop models of a desirable, ideal state of the space and to create the conditions for its realization" (Turowski, 2005, p. 894) traditionally stops at the national border, its scope of action and the competences of spatial planners are legally bound to a nation state and its planning system. However, more and more cross-border functional soft spaces have developed across national borders. Furthermore, exercising political decisions with territorial implications in the vicinity of national borders often influences the neighbouring country's territory. Cross-border cooperation and territorial cohesion are actively promoted and supported by the European Union (EU) (e.g., by financial incentives offered by the Interreg programme). To contribute to the EU's objectives and be more efficient it is necessary to apply a place-based approach of territorial governance as defined by Van Well and Schmitt (2015, 211f.) to functional places that span across national borders. The increasing need to harmonize and coordinate spatial development in border areas is particularly relevant

against the backdrop of increasing interdependencies in the above mentioned cross-border functional areas. Several cross-border regions, e.g., the Greater Region SaarLorLux +, have attempted to supplement and coordinate national policies and programmes of neighbouring countries with cross-border spatial development concepts to contribute to a more efficient spatial development (cf. Bechtold et al., 2020). Cross-border cooperation in the domain of spatial development encompasses a multitude of stakeholders and institutions from various policy sectors and territorial specificities. A complex and ambitious project –even more so than a similar process within a single nation state –it needs to be coordinated through territorial governance. Thus, this difficult task is both time-consuming and costly (Caesar and Pallagst, 2018, p. 24; Nienaber, 2018, p. 175). It is likely that different national planning cultures clash during the coordination and development of policy processes (cf. Caesar and Evrard, 2020). In addition to explicit elements, like individual spatial planning systems and legal regulations, planning cultures comprise many implicit elements such as societal values that are difficult to grasp and address but strongly influence spatial planning practice and territorial governance across borders.

This contribution highlights territorial governance in the context of cross-border spatial development. Firstly, the concept of territorial governance is contextualised in the cross-border setting based on scientific literature. Particularly, the European Union's (EU) conceptual understanding of functional areas, cross-border interdependencies and the place-based approach are illuminating the need for spatial planning and territorial governance across-borders. This is accompanied by examples from the Greater Region SaarLorLux +. This cross-border region, also known as Großregion/ Grande Région encompasses territories of France, Belgium and Germany as well as the country of Luxembourg. Secondly, the authors dig deeper into the reasons for and characteristics of territorial governance when applied in a cross-border context. These remarks are proved with examples of the Greater Region that started its coordination attempts several years ago and recently finalized a spatial development concept. The last section concludes with a definition of territorial governance across borders and discusses its significance and challenges to come up with ideas to overcome them at the end.

A protocol to research climate adaptive governance systems for infrastructure and equity

Author: Patrick Harris^{None}

Co-author: Nicky Morrison¹

¹ *WSU*

Corresponding Authors: nicky.morrison@westernsydney.edu.au, patrick.harris@unsw.edu.au

Purpose:

This presentation presents a protocol, ideas and framework to advance knowledge and research about how built and social infrastructure has co-benefits for climate change and health equity. The focus is to identify the systemic conditions that support best practice governance behind planning and delivery of climate adaptive infrastructure to enable equity.

Background

There are urgent and critical gaps in knowledge about how to create institutional change necessary for developing climate-focused policies and programs that generate positive health and equity impacts (Haines et al., 2020, Heenan et al., 2023). The 2023 Intergovernmental Panel on Climate Change (IPCC) report confirms with 'high confidence' that climate change is impacting 'human health, livelihoods, and key infrastructure' and these 'impacts are concentrated amongst the economically and socially marginalised' (IPCC, 2023). The research protocol presented responds directly to IPCC's recommendations to focus on local institutional responses to the climate crisis (IPCC, 2023). Equity requires a focus on climate justice and institutional transformation.

Innovation in the context of international advances

Infrastructure for climate adaptation and equity requires connections across sectors (Harris et al., 2020), and integration across planning, measurement and evaluation (Giles-Corti et al., 2021, Australian Council of Social Services, 2022). Climate action is nested in a multi-scaled complex system, with each level influencing another. The IPCC recommends, with 'very high confidence' that effective climate mitigation and adaptation combine government, civil society, and the private sector, prioritising risk reduction, equity and justice, integrating decision-making processes, finance and technology, and actions across governance levels, sectors, and timeframes (IPCC, 2023). 'Governance' dynamics are at the centre of institutional effectiveness (Sharma-Wallace et al., 2018). However, our prior research has revealed the tendency for policy sectors to work in separate sectoral silos that limits effective collaboration and holistic approaches necessary to address equity and risks institutional policy inertia that obstructs, rather than supports, action (Morrison and Van Den Nouwelant, 2020, Harris et al., 2020, Harris et al., 2022, Harris, 2022). From this scholarship we present a novel institutionally focused framework.

Methodology

The research advances knowledge about the working dynamics of complex systems involved in policy change mixing new institutionalism, realism, qualitative comparative analysis and systems analysis methodology. The protocol responds to recent scholarship (Byrne and Callaghan, 2022) connecting realist analysis with systems approaches to understand and explain the conditions and mechanisms involved in complex and messy interventions (Shearn et al., 2017, Fletcher et al., 2016, Koorts et al., 2021), including equity across different localities and population sub-groups (Fletcher et al., 2016). Our

previous research has demonstrated the validity of mixing realism and institutional approaches to investigate policy systems (Harris, 2022). Here we add participatory systems mapping to facilitate local policy action (Penn and Barbrook-Johnson, 2019).

Research design

The protocol has five phases. First builds evidence of multiple case studies (Yin, 2012). Second compares cases broadly for their similarities and identify the essential cross case findings, using Qualitative Comparative Analysis (Sager and Andereggen, 2012). Third uses these findings to develop a cross-case systems map. Fourth uses participatory systems design to build context specific systems responses to that evidence, based on the additional experience of local experts and policy makers. Fifth, across the research, is critical realist analysis using relevant theoretical insights to explain the data and provide a narrative explaining the systems maps.

The protocol provides future researchers with a comprehensive suite of methods and approaches to compare multiple case studies of climate adaptive governance and systems change in the face of the climate crisis.

Territorial Transitions and Governance in Alpine Regions: The Case of Valtellina within the EUSALP Framework

Authors: Andrea Arcidiacono¹; Francesca Mazza¹; Gioele Rossi¹; Leonardo Ramondetti¹; Stefano Di Vita¹

¹ Politecnico di Milano

Corresponding Authors: leonardo.ramondetti@polimi.it, gioele.rossi@polimi.it, andrea.arcidiacono@polimi.it, stefano.divita@polimi.it, francesca1.mazza@polimi.it

This contribution stems from a collaboration in academic research, focusing on the potentialities and contradictions of governance frameworks and planning strategies in shaping the ecological and digital transitions driven by the current European Strategy for the Alpine Region (EUSALP). The study is conducted through a research-by-design approach that led us to adopt an empirical methodology applied to the pilot territory of the Valtellina mountain region, in the North of Italy.

Valtellina exemplifies the duality of Alpine territories: its exceptional productive and environmental resources contrast with vulnerabilities from climate change, socio-economic inequalities, and trans-scalar anthropic pressures. The research investigates how new forms of production, energy reorganization, and tourism diversification can integrate into coherent territorial planning scenarios. Participatory mapping of territorial dynamics and the involvement of local stakeholders reveal processes aligning with EUSALP's cohesion, sustainability, and innovation goals (EU Strategy for the Alpine Region, 2023). Flexible and inclusive governance mechanisms capable of navigating tensions between informal "soft spaces" of collaboration and formal "hard" institutional structures are highlighted as critical. Moreover, cross-border governance arrangements that transcend administrative and sectoral silos are emphasized as tools for fostering generative conflict and institutional learning.

The methodology adopts a trans-scalar, interdisciplinary, and place-based approach, actively engaging local communities, cultural associations, and territorial administrations. Results demonstrate that local actors and community-based practices catalyze the conditions needed to implement EU territorial transition objectives (espon, 2018). At the same time, university-led initiatives provide critical support in defining place-based strategies for economic innovation and socio-spatial regeneration. Policy narratives promoting social justice, renewable energy, and digitalization emerge as pivotal for rethinking governance in Valtellina and beyond, offering a spatial approach to support these transitions.

The study also integrates insights from EUSALP, emphasizing the dual role of universities in fostering public action to refine and detail territorial transition strategies while implementing place-based innovation initiatives. In this context, the concept of antifragility takes on particular importance, highlighting how vulnerabilities can be transformed into opportunities through transboundary collaborations in spatial regeneration scenarios (Modica, 2019; Modica, Solero, 2022). Mapping Valtellina's material and intangible networks contributes to a trans-scalar territorial framework that supports cohesion policies and facilitates their local implementation.

Territorial innovation ecosystems are central to the research, which identifies hubs capable of integrating public administrations, associations, enterprises, schools, and universities. These hubs connect productive activities, research initiatives, and material and digital services. Positioned within a cross-border spatial framework, they promote sustainable, resilient, and anti-fragile regional development. Key assets, such as the Milan-Tirano railway, transversal public transport networks, the Adda River's green and blue corridor, and hydropower infrastructure, are leveraged to enhance these hubs' effectiveness.

Building on recommendations from the Joint Paper on Spatial Planning (JPSP) within the AlpGov2 framework, the research underscores the importance of sustainable resource management and climate resilience (EU Strategy for the Alpine Region, 2022). It advocates for multifunctional green, blue, and transport infrastructure networks, aligning with broader European objectives such as the Territorial Agenda 2030 and the EU Green Deal (European Commission, 2024). Valtellina emerges as a pilot area for cross-border spatial planning and integrated governance models, offering lessons that can be transferred to other EUSALP regions.

Ultimately, the study outlines how cross-border spatial planning and design approaches can embed trans-scalar governance into European cohesion and transition policies. By positioning Alpine regions as laboratories for addressing complex contemporary challenges (Perlik, 2019), the research aims to develop a transferable, replicable model to tackle governance issues in fragile mountain areas. These efforts are rooted in trans-scalar scenarios of socio-spatial regeneration that respond to the multifaceted crises affecting these territories.

Reinventing Cities in Madrid: the life and death of a Parisian model of municipal land allocation?

Author: Pedro Gomes¹

¹ *Lab'URBA - EIVP*

Corresponding Author: pedro.gomes@eivp-paris.fr

Reinventing Cities (RC) is a planning and design competition organized by the C40, a global city network of knowledge exchange and policy support for climate adaptation. RC is one of the network's operational tools, through which cities sell sites deemed under-utilized, so that projects tackling C40's ten climate challenges can emerge. These projects must be led by interdisciplinary consortia, including designers, specialized environmental consultancies and developer-investors. RC thus echoes other municipal practices of land allocation for "green" or "innovative" real estate projects in Europe (Bulkeley & Kern, 2006; Candel & Paulsson, 2023; Gerber, 2016; Tambach & Visscher, 2012). RC is a version of Réinventer Paris, launched in 2014, and rapidly exported expanded rapidly thanks to Parisian Mayor Hidalgo's policy boosterism (McCann, 2013). The competition offers market-based solutions to social and environmental problems, utilizing the very high demand of public land to leverage real estate actors into changing their practices. This model sparked controversy in France, with criticism of the role given to private actors in decision-making regarding urban development projects and in urban service provision (Béhar et al., 2018).

Through RC, this model of land allocation travels to very diverse contexts, from an urban, social, economic and politically point of view. Madrid is a particularly intriguing example. The city participated in RC during Ahora Madrid's term at the helm of the City. This 'new municipalist' coalition, led by Manuela Carmena (2015-2019), held office in the aftermath of austerity responses to the subprime and Eurozone crises. Carmona's program included the fight against property speculation, the development of affordable housing and the democratization of urban policies (Janoschka & Mota, 2021). Thus, in Madrid, RC is part of a political fight against a speculative and extensive model of urbanization and against austerity policies (Davies & Blanco, 2017). In a constrained context where Carmena's office had few levers for implementing its ambitious electoral program (Janoschka & Mota, 2021), RC arguably appeared to be a credible tool for countering the speculative logics that had hitherto dominated, given the municipality's enthusiastic participation. Indeed, Madrid took part in the first two editions of Reinventing Cities in 2017 and 2019, and to date remains the second city –after Milan –with the largest amount of

sites proposed across the three editions of Reinventing Cities.

This apparent paradox –a tool travelling from a context where it uses speculative urban development as a lever for “sustainable” real estate to a context where it fights speculation –is the starting point of this presentation. I will begin by placing RC in the broader context of Madrid’s urban policies of recent decades, as a way to explain the adoption of RC by Carmona’s government. The remainder of the presentation will provide an empirical analysis of the “effectiveness” of RC in Madrid. Firstly, I will analyse the motivations of public and private actors involved. Secondly, I will document the evolution of winning projects, as well as the reasons behind abandoned projects or difficult implementation. Finally, I will broaden the scope from mere project implementation to an investigation of the potential traces left behind by the competition, be it within the municipal technos-structure or among the winning group members. The point here is to investigate whether RC contributes to transforming professional practices and the internal organization of urban stakeholders, as the CIUPs in the Paris region have done (Gomes and Pérès, 2022). The circulation of best practice in sustainable urban planning and real estate models might also be found there, beyond the scope of winning consortia and projects.

Introducing a Method for Measuring the Geographic Boundaries and Advantageous Potential Functions of the Wuhan-Xianning Cross-Border Urban Cooperation Zone ——An Investigation of an Emerging Regional Unit in the Adjacent Areas Between Chinese Cities

Author: Zhuoran SHAN¹

¹ School of Architecture and Urban Planning, Huazhong University of Science and Technology

Corresponding Author: 371760860@qq.com

With the rollout of China's national strategy promoting metropolitan area integration, a plethora of urban planning practices spanning administrative boundaries are flourishing across the country, sparking considerable academic interest in a novel type of intercity adjacent regional unit—which we designate as “cross-border urban cooperation zones.” The main contribution of this paper lies in addressing the gap in existing literature regarding methodologies for delineating the geographical scope and boundaries of cross-border urban cooperation zones and forecasting their potential advantageous functions. Using Wuhan, the largest metropolis in central China, and its neighboring city of Xianning as a case study, the research leverages land-use data, corporate data, socio-economic data, mobile phone signaling data, and transportation data. By employing social network analysis, GIS spatial analysis and spatial statistics, as well as landscape pattern index methods, the paper not only devises a “four-dimensional, three-step” framework for identifying the geographical scope and boundaries of cross-border urban cooperation zones but also formulates a calculation method for assessing their potential advantageous functions, rooted in potential indicators, evaluation matrices, and advantage indices. Through these methodologies, the study successfully outlines a 384.8 square kilometer Wuhan-Xianning cross-border cooperation zone, analyzes the divergent land-use growth patterns and population dynamics on either side of the administrative boundary, portrays the natural environmental features of a major lake straddling the two cities, unveils the spatial distribution of manufacturing zones, residential areas, cultural and tourism spaces, and agricultural/forestry lands within the cooperation zone, and highlights the road and railway infrastructure of the cross-border cooperation zone situated at a pivotal node of a regional transportation corridor. Additionally, the paper forecasts the region's most promising future functions in terms of ecological landscape, technological innovation, and healthcare and wellness services. Consequently, the paper conceives a comprehensive spatial planning blueprint for the sustainable development of the region, emphasizing the pivotal roles of ecological connectivity, clustering of scientific research and industries, and the enhancement of healthcare and sports facilities. The research findings will be partially incorporated into the implementation of the upcoming version of Wuhan metropolitan area's territorial spatial planning.

Resources as Mediators: A Case Study of Neighbourhood Conflict in Dingshan, Nanjing

Author: Jinyi Wang¹

¹ *School of Architecture, Southeast University*

Corresponding Author: arteston@qq.com

Chinese metropolises have concealed numerous conflicts during the era of rapid urbanization, highlighting an urgent necessity to resolve these issues in the context of new-type urbanization. This study focuses on a neighbourhood conflict over a road within Dingshan. Residents of a gated community consider this road to be their internal segment and intend to erect a gate to restrict access. Conversely, this road serves as a vital route for external residents, who regard it as public space, asserting their right to pass through. The conflict between the two sides has persisted for nearly three decades since the establishment of the gated community, triggering multiple group confrontations and even violent clashes.

After the mass production of urban space, a bottom-up regeneration process emerges during its utilization, with the dominant actors shifting from governments and real estate developers to urban residents. The spatial competition and neighbourhood conflict are intense forms of urban regeneration, in which the characteristics of space transcend

mere commodities, as described by the theory of spatial production, and become symbolic representations of rights. Therefore, the 'capital' narrative used to explain spatial production proves inadequate in the context of spatial regeneration. This study employs Giddens's structuration theory to analyse the situation, pointing out that resources, as mediators of structure and agency, encompass various forms beyond capital, including knowledge and the body, and examines these dynamics within the neighbourhood conflict of Dingshan.

In the initial phase since the 1990s, after the construction of the road, the property rights remained ambiguous. However, residents from both within and outside the community reached an informal consensus that the road would be shared, permitting pedestrian and bicycle access, while without clarifying whether cars were allowed. Over the next decades, the increasing volume of vehicles and people contributed to the gradual accumulation of contradictions.

From 2017 to 2020, residents within the community took an initiative action to establish an owners committee, replaced the property management company with strict regulations, closed the gate, and reinforced the physical boundaries using communal funds. During this period, residents outside the community attempted to pass through by disputing and fighting, resulting in the intermittent opening and closing of the gate.

From 2020 to 2022, during the COVID-19 pandemic, the government officially decided to close the community gate. In light of public health concerns, residents both inside and outside the community temporarily agreed to this measure. After the pandemic, the Municipal Planning Bureau clarified that the road was publicly owned. Consequently, the accessibility of the road led to a conflict between external residents advocating for social justice and internal residents defending their property rights, resulting in a violent confrontation. The incident prompted intervention from higher-level government authorities, who deployed armed police to calm the situation and stationed a police car at the gate, preventing its closure and car access. Subsequently, both sides have largely accepted this resolution imposed by the higher authorities, and the police car remains in place to this day.

Throughout the case, both groups of residents utilized various resources, including capital, knowledge, and the body resources, to engage in the conflict. This situation illuminated the tensions between national and local governance, as well as among different levels and branches of government. The government's actions, which involved the downward distribution of knowledge resources and the upward reclamation of physical (violent) resources, significantly influenced the conflict dynamics. Additionally, this case reveals issues such as the ambiguity in land rights confirmation and regulation, the evasion of institutional responsibility, and inadequate information release.

The materials and data for this study are derived from the author's ethnographic research conducted over the past three years.

An Overview of Urban Policymaking through Institutionalisation for Development of the Cities in Turkey

Authors: Deniz Özgül^{None}; Ebru Kerimoğlu^{None}

Corresponding Authors: kerimoglu@itu.edu.tr, dnz.ozgul5@gmail.com

Institutions enable organised and collective efforts to address common concerns and achieve social goals (Dovers, 2001). Institutional innovations can occur at various scales when the context in which people and decision-makers operate changes and impose new constraints on them. Climate Change and environmental challenges are today the main drivers of institutional change at all levels (Hamdouch & Zuideau, 2010). The impact and struggle of urban policies on these changes create new forms of urban man-

agement, and policies are constantly discussed and updated (Rotmans et al., 2000). Institutional capacity adequacy is a necessary condition not only for crisis management but also for all stages of urban development today, with institutional capability and governance being substantial factors in the development of cities. For relevant institutions, cross-sectoral integrated thinking, flexibility of resources, clarity and transparency constitute strong institutionalised capacity (OECD, 2016). Integrated, comprehensive and flexible management of social, cultural, demographic and environmental changes cannot be possible without updating management patterns and policies. Policy actors have different political and technical capacities to select and reorganise new instruments within existing institutional arrangements (Mukherjee et al., 2021). Changing political and structural conditions can lead to different policy effects of the same institutional arrangements. The design of policies and their provisions under specific circumstances significantly impacts the patterns, processes, and outcomes of incremental and endogenous policy change in the actual policymaking (Ahn, 2024). Economic developments and production processes in the world are usually reflected in urban areas, and related environmental, social and institutional processes accelerate the change in urban areas. Ensuring urban economic sustainability and developing efficient interventions for all developments are at the centre of urban policies. This can only be achieved through institutionalisation. Institutionalisation ensures effective use of resources by providing a transparent and systematic control cycle. It can be achieved and sustained by developing institutional capacities, fostering collaborations, creating and utilizing new funding sources, and adopting flexible management models. This study aims to emphasise the importance of institutionalisation in contemporary urban policies and related implementation tools. In the case of Turkey, in addition to the institutions and legal regulations responsible for making urban policies, institutionalisation and institutional transformation efforts are discussed through institutional capacities, funding sources, collaborations and awareness. Within the purpose of the study, the main questions are: Are the capacities of local governments, which have endeavoured to update their policies and institutions as a reflection of urban politics in recent years, sufficient to create the order they envisage, make and implement policies? Which implementation and legal tools are used in urban development to reflect policies on the city? Central and local institutions within the legal hierarchy in urban practices are examined concerning the subject. The institutional change efforts of local governments have been evaluated through interviews with urban planning agencies, most of which have been established in the last few months, and municipal unions and their approaches and policies have been put forward about urban politics and institutionalisation. It can be said that organisations with strong institutional capacity are capable of carrying out the most effective and innovative practices. Individual skills seem to be effective in this regard. Collaboration and institutionalisation awareness are open to discussion. It is a necessity for policymakers to update their agendas, understand the developments, and work towards developing innovative policies by overcoming legal constraints. Local governments' efforts for urban policymaking should updated on the axis of institutionalisation, away from the shadow of populist urban politics. Efficient institutional capacity includes human and intellectual capital, awareness, collaborations, innovative, flexible and horizontal management models.

T_04 GOVERNANCE (A) / 257**Typologies and Dynamics of Urban Growth Projects in Ethiopia: A Discursive Analysis****Author:** Han Gao¹¹ *Southeast University***Corresponding Author:** gaohanseu@outlook.com

Ethiopia is one of the fastest-growing economies and urbanizing countries in sub-Saharan Africa. The rapid expansion of existing urban areas and the significant increase in the number of new towns highlight the remarkable trends in Ethiopia's urban growth. This urbanization process is accompanied by large-scale urban projects aimed at promoting long-term urbanization and modernization in the country. The objective of this study is to identify the typologies of Ethiopia's urban growth projects and analyze the dynamics underlying these projects through a discursive approach.

First, the study synthesizes existing research on emerging towns to outline a "toolbox" for facilitating urban spatial growth in the Global South. Second, it examines Ethiopia's urban growth typologies by tracing urban policy documents and urbanization actions. Third, through comparative analysis, the study situates urban growth projects within broader political-economic processes and historical contexts to analyze the dynamic mechanisms driving these projects.

The study identifies three main types of urban growth projects that Ethiopia has consistently implemented, spanning both the EPRDF and the current Prosperity Party administrations: (1) New City Development Driven by Place-Based Spatial Policies: These projects adhere to the logic of spatialized economic policies, creating new growth poles with statutory legitimacy. Specific examples include tourism-oriented eco-cities, urbanization strategies integrated with industrial parks, and satellite cities. (2) Large-Scale Urban Renewal Initiatives: These projects focus on upgrading existing urban centers through substantial investments in infrastructure and commercial projects, thereby reshaping the conditions for urban capitalization. Representative cases include recent corridor development plans in major cities. (3) Reconfiguration of Spatial Governance Areas: This involves reorganizing unstable administrative boundaries to redefine the strategic rules governing political and economic activities. Examples include Shager City surrounding Addis Ababa and multiple economic zone initiatives.

Furthermore, through discursive analysis, this study compares these three types of policies using both diachronic and synchronic approaches to explore their discursive contexts, spatial practices, and power relations, as well as the similarities and differences among the projects. The findings reveal the following: (1) All three types of projects respond to Ethiopia's historical-geographical conditions, particularly issues related to ethnicity and land tenure, reflecting paradigms of urban spatial production and reproduction informed by Global North experiences. (2) The continuity of authoritarian governance ensures the knowledge production and implementation of diverse urban growth projects, reinforcing their top-down and state-driven nature. (3) Despite the continuity of the three types of urban projects, their underlying developmental logics have evolved across political-economic periods. Specifically, there has been a shift from the developmentalist, rural-urban equalization logic of the EPRDF era to the scalar reorganization and entrepreneurial urbanism of the Prosperity Party period.

The cautious revival of national spatial planning: lessons from the Netherlands

Author: Jochem de Vries¹

Co-author: David Evers²

¹ *University of Amsterdam*

² *University of Amsterdam/Planbureau voor de Leefomgeving*

Corresponding Authors: j.devries1@uva.nl, d.v.h.evers@uva.nl

Abstract

In various European member states, there has been a call for enhancing national spatial planning (Yang et al., 2024; Breach, 2024). The housing crisis is an essential driver behind these calls (ESPON, 2024), but not the only one. Protecting essential ecosystem services, promoting renewable energy, climate adaptation and, lately, reserving space for military use have also been cited as reasons for introducing or enhancing national planning. Conversely, the lack of national planning is often blamed for urban sprawl and/or the uncontrolled proliferation of datacenters and logistical facilities.

Dutch national spatial planning was long heralded as a European forerunner. However, this reputation gradually declined after the turn of the century. In the era of neoliberalism, the Dutch planning system was subjected to far-reaching decentralisation and deregulation (Roodbol-Mekkes, van der Valk and Altes, 2012; Zonneveld and Evers, 2014). In the past decade, subsequent national administrations have asserted the intention to 'reclaim control' to tackle the country's major spatial challenges.

In this paper, recent attempts at a comeback of national spatial planning in the Netherlands are assessed against theoretical and historical notions about the success and failure of national spatial planning strategies. The paper claims that the effectiveness of Dutch national spatial planning can only be understood in the institutional context in which it was developed and executed. For the institutional analysis and the analysis of the emerging strategy, we draw on Ostrom's IAD-framework, the concept of policy arrangements (Arts et al. 2006) and the concept of planning doctrine (Faludi and Van der Valk, 1994).

The renationalization of spatial planning –by means of the 2020 National Environment and Spatial Strategy (NOVI) –is occurring under entirely different circumstances than when it was denationalised around 2000 (Evers, 2024). The legacy of decentralisation, rise of populism, consolidated power of commercial actors are all factors to be reckoned with. The case offers insight into the relationship between institutional conditions and the success- and fail factors of national strategic planning. As such forces are present elsewhere in Europe, and Dutch national planning's history is generally seen as exceptional, the Dutch case can be seen as an extreme case to learn from in different contexts.

Ethnographies of Institutional Learning within Social Innovation Encounters: the case of Turin (Italy)

Authors: Nadia Caruso¹; Saskia Gribling¹

¹ *Politecnico di Torino*

Corresponding Authors: saskia.gribling@polito.it, nadia.caruso@polito.it

The contribution addresses questions of institutional learning within planning policies, proposing Social Innovation (SI) as a conceptual companion to investigate the region of Piedmont in Northern Italy. The term is extensively used and extremely hyped (Vigar *et al.*, 2020). Yet, the project urges to examine the socio and spatial distribution of emerging inequalities and disadvantage patterns. It focuses on the importance of spatial infrastructures in addressing these issues with a local, pragmatic, and civic answer.

Given this framework, the research investigates what institutions could learn from these social practices of cooperation by implementing analysed experiences in planning tools and policies. Thus, the public administrations could have a pivotal role in stabilising community-based activations, which may, otherwise, lose their *momentum* and effectiveness.

The paper focuses on the peculiar regional case with a specific zoom on the metropolitan area of Turin. During an initial mapping phase, the metropolitan context has shown a high-intensity concentration of civic activities, which partly sustain themselves thanks to philanthropic operations of private foundations and bank institutions and *ad hoc alliances* with public bodies. The analysed activities fall under a definition of SI that enhances territorial development and a general social value through everyday actions for the territory and its local communities. SI is always localised and grounded in a specific context, making the concept decline in its operative actions. In-depth interviews with emblematic actors carrying out these local activities have confirmed a first hypothesis: the Turin case works thanks to an endured cooperation fostered in twenty years of conciliated collaboration between strategic visions and “real-world projects” (Ponzini and Santangelo, 2018).

The research explores how these SI realities exist, work and sustain themselves by placing their operations in the broader network of formal and informal relations with different actors they have established throughout the years. Research shows that a wide and heterogeneous net is already established within the Turin territory and that, thanks to its recognition, the Municipality increasingly involves these emergent actors in its public strategies, generally proposing a collaborative cooperation model. Therefore, this contribution proposes focusing on the drifts during these encounters.

By shifting the question to ‘how and if public Institutions learn from SI projects?’ the research addresses the Social Innovation discourses towards enabling learning patterns that could be test ground for similar local realities and thus endure civic initiatives and let them become stabilised within normative planning frameworks. To do so, partial results from an ongoing institutional ethnography will be discussed. The role of ethnography affects the research on the epistemological and methodological levels since it will ground the research in the middle of things by proposing to exceed an *a priori* definition of Social Innovation. By drawing on STS (Science and Technology Studies) methods, the proposal aims to shift knowledge production *in media res* and grounds the research in practice. The ongoing institutional ethnography intersects social innovation practices with policy instruments that specifically address and form the issues. This grounded perspective would facilitate assessing how and if institutions learn from the practices. Moreover, the research inquires to what extent the processes of stabilisation of SI practices within planning tools are welcomed or not, becoming governmental tools. Combined with the previous collection of data retrieved from the mapping, the micro-social perspective given by the ethnographic account will thus sharpen the reconfiguration of social and planning innovation landscapes.

This contribution is part of the broader research project RESISTING - Reconnecting Social Innovation with Institutions in Urban Planning, funded under the National Research Program of National Interest (PRIN NRRP 2022), within Italy’s National Recovery and Resilience Plan. RESISTING studies three different Italian regional contexts.

Regional planning for no net land take: Designing strategic planning processes in peri-urban Austria

Author: Philip Krassnitzer¹

¹ *University of Vienna*

Corresponding Author: philip.krassnitzer@univie.ac.at

Reducing land take is indispensable for climate protection, biodiversity, flood prevention and food security. Land take –understood as the conversion of land to artificial surfaces –is a pressing issue in the peri-urban areas, where agricultural land and housing developments meet and pressure for land reallocation is particularly high. This dissertation project explores the role of peri-urban regions in achieving soil protection goals and highlights the need for integrated strategic plans. It examines their potentials to foster soil conservation and socio-spatial transformation. This research focus on the process level: How can strategic planning processes be designed to reduce land take and encourage social-spatial transformations in peri-urban regions?

Austria has an extraordinarily high rate of land take, consuming approximately 11 hectares per day. The increasing scarcity of high-quality soils highlights the urgency of immediate action. Environmental organisations and renowned experts advocate for a 'no net land take target'. This means land take should not exceed 'reverse land take'—the conversion of artificial surfaces back into (semi-)natural land (ESPON, 2024). Land take is especially high in peri-urban regions, where land policy instruments are applied less frequently and less effectively. Structural deficits, such as fragmented competencies and the lack of quantitative targets, hinder the implementation of sustainable and just land policies. Addressing these challenges, scientists and planners need to engage also with (and improve) existing instruments and processes.

Sustainable land policy requires coordination across all planning levels, instruments and stakeholders. Regional planning bridges national objectives and local land-use planning and coordinates intermunicipal planning actions. In this context, integrated strategic plans —such as regional programs and concepts —are gaining importance by the coordination of regulatory measures and actions for the transformation of the existing fabric. As soil protection is an ongoing regional responsibility, planning concepts need to be long-term oriented, robust in their objectives and flexible in their implementation. Using planning culture (Othengrafen, 2014) as an analytical framework, this research examines three strategic planning processes and their impact on land consumption:

1. The “Regional programme Pongau”(2024) is a formal instrument that sets spatial regulations for municipalities while integrating a regional strategy for bioeconomy and circular economy.
2. The “Regional guideline for the region of Mödling”(2023) was developed through a communicative planning process and evolved into a legally binding regional program.
3. The “Action program for activating vacant properties and town recovery”for the region of Strudengau Nord (2024) prepared a regional strategy to support funding instruments for building revitalization and brownfield redevelopment.

These cases illustrate different approaches to soil protection and spatial transformation at a regional level. They vary in their combination of development impulses and regulatory determinations. Each case is innovative in showing a different way towards implementation of methods and also in its process organization. Given that each region is unique, with its own set of potentials and challenges, planning processes need to be tailored accordingly. Designing planning processes must be taken as a creative task. By comparing these cases, this research aims to identify key learnings for developing task-specific strategic planning processes that contribute to no net land take.

Metropolitan Governance for Just Retrofit-Led Regeneration: A Comparative Analysis of London and Barcelona

Author: Lucia Cerrada Morato¹

Co-authors: Cecilia Lopez Conde ¹; Marc Marti-Costa ¹

¹ *Institut Metropolí*

Corresponding Author: luciacmorato@gmail.com

Metropolises are increasingly spaces of stark inequalities, characterized by significant disparities in access to resources, housing, and opportunities. While traditional academic literature highlights the positive impacts of the metropolitan scale in fostering economic growth through agglomeration effects (Scott & Storper, 2015; Glaeser, 2011), recent scholarship identifies a critical gap: the lack or weakness of redistributive governance mechanisms in metropolitan areas as a major driver of growing urban inequalities (Brenner, 2019; Moore-Cherry et al., 2021). These inequalities are particularly pronounced in housing, where access to adequate and affordable living conditions remains a pressing challenge (Rolnik, 2019).

This study argues that the redistributive capacity of metropolitan entities is significantly influenced by their governance structures. Specifically, the balance between metropolitan leadership and municipal autonomy, alongside the interplay between public and private actors, determines the potential for addressing inequalities through urban policies and initiatives. To explore these dynamics, a comparative analysis of two prominent metropolitan regions—Barcelona and London—was conducted. These cities offer distinct governance models and policy frameworks, providing valuable insights into how metropolitan governance can advance a more just approach to housing retrofits and regeneration.

The analysis focuses on the scope of metropolitan plans and policies in promoting equitable housing retrofits, particularly through the lenses of redistributive justice and sustainability. Housing retrofits—upgrading existing residential buildings to improve energy efficiency, affordability, and livability—represent a critical intersection of environmental, social, and economic goals (Sovacool, 2021). Using qualitative methods, including policy document analysis and interviews with key stakeholders, the study examines how governance structures in Barcelona and London enable or constrain the pursuit of ambitious and redistributive retrofit agendas.

Findings reveal that metropolitan governments play a pivotal role in supporting municipal administrative units within their jurisdiction by acting as coordinators that provide technical and financial resources while setting broader strategic priorities. Both Barcelona and London demonstrate the capacity of metropolitan entities to establish ambitious retrofit policies addressing housing inequalities. However, key differences between the two cases underscore how governance dimensions shape policy outcomes.

In Barcelona, the metropolitan governance model, while claiming municipal subsidiarity (Blanco et al., 2019), operates through a high degree of centralization in decision-making and implementation, advancing overarching redistributive goals in practice. Con-

versely, London's governance model emphasizes metropolitan leadership while relying on strong municipal subsidiarity for policy implementation. Additionally, the role and responsibility of non-government actors in retrofit implementation vary significantly, with London granting a more substantial role to private entities. These differences highlight tensions between subsidiarity and metropolitan authority, the recalibration of municipal needs, and the negotiation of roles between public and private sectors in delivering housing retrofits (Perry & Harding, 2002).

The study concludes that metropolitan governance is crucial for setting equitable housing agendas. However, its effectiveness hinges on balancing local and metropolitan priorities, fostering inclusive partnerships, and addressing structural power dynamics. Understanding these governance dimensions is essential for designing metropolitan policies that reduce inequalities and promote sustainable urban development.

Governing tactical urbanism. Innovation in decision making processes and planning approaches in the case of Genoa, Italy.

Author: Carla Baldissera¹

Co-authors: Giovanni Lanza¹; Paola Savoldi¹; Laura Galluzzo²

In recent decades, an increasing number of cities worldwide have incorporated tactical urbanism into their urban planning strategies challenging traditional governance schemes and well-established planning approaches.

Some local administrations have developed structured tactical urban planning programs, defining criteria and priorities for implementing tactical experiments through a comprehensive, citywide approach. Otherwise, others have implemented individual

transformations isolated one from another. The different interpretations of tactical urbanism vary according to the needs and objectives: it can be employed as a demonstration tool by the citizens, as a response to an urgent need, or as a test bed for structural transformations that the administration may implement.

This contribution explores the experience of Genoa, an Italian city currently experimenting with tactical urbanism through a first pilot test. This initiative is intended as the starting point for developing an urban-scale strategy aimed at scaling similar interventions across different neighbourhoods citywide.

The pilot project involved the municipal administration in collaboration with the Departments of Urban Planning and Design of Politecnico di Milano as scientific consultants to support the whole decision-making process: from the selection of the suitable areas, thanks to a qualitative-quantitative study conducted by the university, to the design and implementation of the interventions through a participatory process involving residents and local stakeholders.

The combination of interdisciplinary expertise was crucial in addressing the project's various phases. This collaboration facilitated inputs such as accessibility analysis, interviews, design, participation. The process required a continuous trade-off between the findings of qualitative-quantitative research, the aspirations of the population, and the technical, economic and administrative feasibility of the proposed interventions as assessed by the municipal administration.

The incremental nature of the process provided a learning-by-doing opportunity for the actors involved in its implementation, particularly the municipal administration, which for the first time is facing a dynamic, uncertain planning process characterised by an innovative *modus operandi*: a more rapid, shared and participatory planning process, both in the identification of the areas on which to intervene and in the definition of the entities of the transformations. Adjustments, and thus changes, were necessary during the project, both in terms of the tools and methods utilized and the process.

This paper will present the experience conducted, discussing its process, adjustments and implications for the project. Some limitations and strengths will emerge: a flexible timeline that underwent continuous adjustments due to political changes, the involvement and turnover of different referents within the municipality; a slow, but constant dialogue between various levels of the administration (municipality and town hall); a continuous interaction between different expertise within the administration (involvement of several directorates) and the university.

In the context of an administrative apparatus confronted with an experimental scenario, these elements, far from being of minor significance, have facilitated the conceptualisation of suitable recalibrations and adjustments to the adopted approach. These reflections are fundamental in enabling the administration to adopt a working method applicable in other contexts and to develop an urban strategy.

City-to-City Learning for a Climate-Neutral Future: Insights from the NetZeroCities Twinning Learning Programme

Author: Lita Akmentina¹

Co-author: Luiza Schuch de Azambuja¹

¹ *FinEst Centre for Smart Cities, Tallinn University of Technology*

Corresponding Authors: lita.akmentina@taltech.ee, luiza.schuch@taltech.ee

With cities facing complex and systemic challenges, city-to-city (C2C) collaborations are increasingly recognised as an effective mechanism for municipal capacity building and transfer of knowledge and practices (Moodley, 2020). C2C exchanges have become a widely occurring phenomenon facilitated by city networks, funding programmes, and projects. It is positioned as a form of peer learning –an organised yet dynamic process between municipalities for mutual learning among cities that face similar challenges (Hoetjes, 2009; Enseñado, 2024). Despite the popularity of different C2C learning programmes, there is still limited understanding of how the learning takes place, its impact, and the experiences of the participating city practitioners (Haupt et al., 2020; Moodley, 2020). Therefore, using the example of the NetZeroCities Twinning Learning Programme, this study explores the process, forms, outcomes, and enabling conditions of C2C learning, supporting replication and knowledge transfer among cities striving to achieve climate neutrality.

NetZeroCities is a platform supporting the EU Mission: Climate-Neutral and Smart Cities. This platform is designed to help European cities build capabilities and ways of working to advance systemic change through innovation, including piloting (i.e. Pilot Cities Programme) and C2C learning (i.e. Twinning Learning Programme) programmes. While the Pilot Cities Programme enables the testing and implementation of innovative approaches for rapid decarbonisation through single-city or multi-city Pilot Activities, the Twinning Learning Programme makes it possible for other cities to learn from Pilot Cities. This Learning Programme is an expert-facilitated C2C learning programme pairing Pilot Activities with selected Twin Cities and enabling a structured mutual learning experience. This study explores Cohort 1 of the NetZeroCities Twinning Learning Programme, which takes place from September 2023 until May 2025 and involves 37 Twin Cities paired with 25 Pilot Activities (implemented in 53 Pilot Cities). It analyses (1) the overall structure and outcomes of the Programme and (2) three in-depth case studies (Pilot and Twin pairings) involving 8 cities from 7 countries. The study employs a primarily qualitative approach combining analysis of Twinning Learning Programme (Cohort 1) documentation and participants' feedback (from cities and facilitators), direct observations during C2C learning facilitation and process documentation, and analysis of the Programme outputs and deliverables.

The preliminary results show mixed outcomes. On the one hand, cities are satisfied with the Twinning Learning Programme and actively share knowledge and practices, especially during face-to-face interactions. On the other hand, the Programme is designed with a greater focus on Twin Cities, enabling structured and result-driven learning from the Pilot Cities while facilitating largely interest-driven learning from Twin Cities. Therefore, it limits the depth of mutual learning that is additionally impacted by the prior matching of cities (alignment of learning interests, climate ambitions and portfolio of actions, and contextual factors). Furthermore, the in-depth cases show that depending on the learning interests, cities engage in different forms of learning; for example, some cities emphasise technical learning while others primarily pursue conceptual or social learning. The participating cities also show different levels of preparedness to activate and engage with their local ecosystem during the Twinning Learning Programme, which is crucial for ensuring learning and knowledge transfer on institutional and societal levels and creating organisational memory. Finally, follow-up research will allow to assess the sustainability of established C2C collaborations and the longer-term impact of the Programme.

T_04 GOVERNANCE (A) / 628**Are You a Stakeholder or a Streekholder? Formal and informal planning in the Flemish-Dutch Delta****Author:** Alankrita Sarkar¹¹ *Delft University of Technology***Corresponding Author:** a.sarkar-4@tudelft.nl

Grenspark Groot Saeftinghe (Borderpark Saeftinghe) is a transboundary region located within the Flemish-Dutch Delta, a significant river delta shaped by the Rhine, Meuse, and Scheldt rivers. The territory of Flemish-Dutch Delta spans provinces in the Netherlands and Belgium, including Antwerp, East Flanders, West Flanders, Zeeland, North Brabant, and South Holland. As a region of strategic importance, it hosts major international ports such as Rotterdam and Antwerp, serving as a critical gateway to Europe's hinterland. Saeftinghe exemplifies the challenges and opportunities inherent in transnational governance and spatial planning. The region faces increasing environmental pressures, such as sea-level rise and pollution from port activities, which threaten its ecological and socio-cultural resilience. As one of the largest tidal areas in western Europe, Saeftinghe holds an importance in the European level as well. Thus, the value of this region has been recognised historically from an economic, ecological, political viewpoint. Situated within the environmentally sensitive estuary, this region exemplifies greater challenges with sea level rise and extensive pollution from the port activities. Despite these hurdles, it creates opportunities for experimentation in the dialogues, both the local and transnational levels.

Since the Flemish-Dutch Long-Term Vision for the Scheldt estuary was established in 2001, cross-border planning initiatives have sought to address these challenges through multi-level collaboration. Central to these efforts is the INTERREG project Grenspark Groot Saeftinghe (GGS), initiated in 2016, which brings together 11 key organizations, including the Port of Antwerp-Bruges, EGTS Linieland van Waas and Hulst, and governmental authorities from both Dutch and Flemish territories. In addition to formal stakeholders, local citizen groups, referred to as "streekholders" (a term coined by Grenspark Groot Saeftinghe - GGS), have played an active role in preserving the region's socio-cultural identity. These grassroots initiatives have complemented formal governance structures, creating a dynamic interplay of interests, power dynamics, and collaborative efforts. The GGS framework highlights the complexities of navigating such diverse and, at times, conflicting objectives to achieve a sustainable future for this region.

This paper explores governance and planning at two interlinked scales: the Saeftinghe region and the broader Flemish-Dutch Delta. By examining how governance frameworks integrate both formal and informal actors, the study sheds light on the interscalar dynamics that underpin sustainable spatial planning in transnational contexts. Particular attention is paid to the intricate relationships among stakeholders, including governmental bodies, port authorities, environmental organizations, and streekholders. The analysis highlights how these actors navigate the tensions between environmental conservation, economic development, and social cohesion, ultimately shaping the region's trajectory.

Saeftinghe's experience offers valuable insights into the challenges of coordinating cross-border planning, managing competing interests, and fostering resilience in transboundary territories. Navigating through these conflicting interests and power dynamics, this article delves into the intricate web of relationships among the

streekholders and stakeholders to understand the interplay between nature-port-society in Saeftinghe and the impact of it in the Flemish-Dutch Delta. This study contributes to the broader discourse on interscalar governance and cross-border planning by illustrating how the interplay of nature, port, and society in the Flemish-Dutch Delta provides a pilot case for sustainable methodologies and strategies. It aims to find the potential of multi-level and collaborative governance frameworks in addressing the complexities of transnational territories.

Public-Private Partnerships in Urban Regeneration Projects: the Italian context and the case of “Porta a Mare” in Livorno

Author: Paula Vale de Paula¹

Co-authors: Jorge Manuel Gonçalves¹; Rui Cunha Marques²

¹ *CiTUA, Instituto Superior Técnico, University of Lisbon*

² *RCM2+, Department of Industrial Engineering and Management, Lusófona University*

Corresponding Authors: rui.marques@ulusofona.pt, jorgemgoncalves@tecnico.ulisboa.pt, paulavaledepaula@tecnico.ulisboa.pt

Urban regeneration has been included in the urban planning of different cities, either as a response to observed urban degradation and decline or to give new functions to obsolete areas and control urban growth. Despite its enormous importance in today's urban contexts, urban regeneration is not a simple task, and, in many cases, urban regeneration projects are complex, involving different types of risks and high investments. Furthermore, it is known that the public sector, as the provider of several types of infrastructure and public services, does not have the resources to meet all of today's urban demands. In this sense, the actions of the private sector through Public-Private Partnership (PPP) agreements can be strategic in urban regeneration and the development of urban regeneration projects.

In the Italian case, Public-Private Partnership arrangements can be of three types: contractual, institutionalized, and negotiable. Urban Regeneration, in the Italian context, aims to increase the value of the existing.

However, implementing PPP arrangements in urban regeneration projects is controversial, and the initial objectives are not always achieved. Despite sounding good in theory in many cases, these projects do not meet their initial objectives, do not achieve the public service objectives proposed, and have negative consequences, both in financial and social terms.

Therefore, it is important to better understand best practices to make these partnerships work more effectively. Best practices can be observed if the Critical Success Factors (CSFs) are being followed. Despite this, studies about CSFs in PPPs in urban regeneration projects are limited. Studies that analyze specific contexts or cases, which could benefit the understanding of these practices, are also limited.

In this sense, this study aims to analyze the Italian context concerning PPP agreements in urban regeneration projects and a specific case of an urban regeneration project carried out through a PPP agreement - the Livorno Port project called “Porta a Mare”. The “Porta a Mare” project, carried out through an institutional PPP, aimed to regenerate a sprawling industrial area and give it new urban functions.

To this end, the study uses a previously established framework, which considers clusters related to the external environment related to the PPP projects - a country's enabling environment that facilitates or does not facilitate the implementation of partnerships and the exogenous factors found in that country - and the internal environment of the PPP projects - referring to the partnership itself and its different phases - the preparation

phase, the procurement phase, and the contract management phase.

The analysis was based on primary data, resulting from interviews with the players involved, and secondary data, extracted from laws, regulations, official documents, scientific articles, and promotional documentation.

The results highlight the CSFs that have been well met and the factors that should be better developed in the Italian context and the specific case study. Furthermore, the study demonstrates the complexity of PPP arrangements in urban regeneration projects and the results obtained from these practices, including their social, economic, urbanistic, and architectural impacts.

The analysis of the Italian context and the case study based on the framework provide a better understanding of the CSFs for PPP agreements in urban regeneration, contributing to the literature on the topic and potentially assisting public and private managers in improving these practices.

Impacts of rapid policy changes on sustainable urban development: a dynamic assessment based on China's Urban Green Action and SDGs

Author: Jingjing Li¹

Co-author: Xiangrong Wang¹

¹ *Beijing Forestry University*

Corresponding Authors: wxr@dyla.cn, ljj213bjfu@outlook.com

Achieving sustainable urban development is a critical pathway for advancing the Sustainable Development Goals (SDGs) (Klopp and Petretta, 2017), and the implementation of effective and sustainable policies is essential to achieving this objective (Lowe et al., 2022). In this context, China has launched a series of the Urban Green Action (UGA) plans, such as the Eco-Garden City, the National Forest City, the Park City initiatives. These plans include a number of policies and corresponding indicator systems designed to provide nature-based solutions to the socio-environmental challenges associated with rapid urbanization (de Jong et al., 2016). However, research suggests that in China's top-down governance system, rapid policy changes are often key drivers of urban change and development (Jia et al., 2020). While previous studies have extensively explored the implementation effects of the China UGA policies (Zhang et al., 2021, Wang and Cheng, 2024), there remains a lack of in-depth analysis on whether rapid evolution of these policies impacts the long-term sustainability of SDGs.

To address this gap, the study examines the relationship between dynamic changes in UGA policies and sustainability urban development. Specifically, it evaluates the sustainability of these policies by analyzing their effects before and after implementation. The study focuses on addressing two key research questions: 1) Are there differences in SDGs-oriented sustainable urban development at different stages of UGA policy implementation? 2) To what extent can these differences be attributed to shifts in the three sub-three UGAs polices, namely the Eco-Garden City, the National Forest City action and the Park City initiatives?

Using Hangzhou City as a case study, this study quantitatively analyzes the impacts of the three sub-three UGAs on the SDGs across three implementation phases (2005-2009, 2013-2017, and 2019-2024). An indicator system aligned with the United Nations 2030

Agenda for Sustainable Development (UN-SDGs) framework was constructed, featuring 21 indicators across three dimensions of economy, society and ecology. Propensity Score Matchin (PSM) and Difference-in-Difference (DID) models were employed to systematically assess how shifts in the sub-UGAs influenced the sustainable development of Hangzhou City.

The findings reveal the following: 1) Overall, Hangzhou's coherence in sustainable development has improved significantly between 2005 and 2024, reflecting the positive role of the three sub-UGA policies in promoting the city's long-term development. 2) Notable improvements in social and ecological indicators were observed after 2008, suggesting a strong correlation between UGA policy shifts and progress towards the SDGs; 3) Although rapid changes in UGA policies have had complex impacts on long-term SDGs progress, the continuous improvement and enrichment of indicator systems have contributed to improvements in social indicators and the balanced development of economic and ecological dimensions.

The study reveals the dynamic relationship between policy changes and urban development, highlights the importance of developing coherent and long-term effective policies, and provides valuable insights for refining the implementation strategies of UGA plans to enhance urban sustainability.

What's the planner's role in policy making for sustainability? Using Q methodology to explore how public planners perceive their scope of action

Author: Eva Purkarthofer¹

Co-author: Dominic Stead¹

¹ *Aalto University*

Corresponding Authors: eva.purkarthofer@aalto.fi, dominic.stead@aalto.fi

In the context of planning, sustainable development is a ubiquitous yet vague goal which can be pursued through a broad range of policies and policy mixes (Griggs et al., 2017; Gunder & Hillier, 2009). Neither of these policies are unavoidable or self-evident. Rather,

they represent conscious or unconscious choices, determined by different knowledges, path dependencies, institutional frameworks and the actions and interactions of individuals. Consequently, they are the outcome of the dialectic between agency and structure (Giddens, 1984).

This contribution aims to explore what role individual public planners play in the creation of policies geared at sustainable development –or more precisely how they perceive their influence. The literature suggests that there are different ideal types of actors: the “doers”, who strive for pragmatic solutions; the “entrepreneurs” who use creativity and networking skills to tap existing potentials; the “bureaucrats” who aim for inclusion, dialogue, and improvement of rules within an established system; and the “neutrals” who focus on their technical expertise or their own careers (Purkarthofer and Stead, 2023).

These theoretical actor types will be contrasted with the data obtained through an online Q questionnaire in which public planners are asked to sort statements about their work practices and perceived influence. Q methodology is able to elicit, evaluate and compare subjective viewpoints (Robbins and Krueger, 2000) and is therefore suitable to delineate a nuanced picture of planners’ self-assessment regarding their role in the policy making process. The study invites public sector planners from four countries (Austria, Finland, Italy, United Kingdom) to participate.

Investigating the leeway of planners contributes to shed light on the question where policies aimed at sustainable urban development become concrete and how agency plays a decisive role in defining actions in a specific context. Such a view enables us to move beyond blanket statements such as “agency matters”/ “structure matters” and towards an empirically informed view of how planners perceive their role and agency in policy making. A better understanding of planners’ scope of action can reveal new perspectives on sustainability leadership (Purkarthofer, Halko and Mäntysalo, 2024), the tensions between technocratic modes of governance and the complexities of places (Raco and Savini, 2019) and help to reflect on the (changing) role of the planner (Fox-Rogers and Murphy, 2016).

Similar Networks, Different Discourses: Comparing interpretive frameworks for climate adaptation in Dutch water and road infrastructure planning

Author: Cheyenne Raskeyn¹

Co-authors: Jos Arts ¹; Margo van den Brink ¹; Tim Busscher ¹

¹ *University of Groningen*

Corresponding Authors: c.a.raskeyn@rug.nl, t.busscher@rug.nl, jos.arts@rug.nl, m.a.van.den.brink@rug.nl

Infrastructure networks face significant challenges due to climate change (Tavasszy et al., 2016). Road networks, in particular, are vulnerable to extreme weather events, potentially leading to disruptions such as flooding or subsidence, especially when multiple climate drivers interact and amplify each other (KNMI, 2023). Despite road infrastructure being recognized as critical infrastructure (OECD, 2019), climate adaptation in this sector remains underexplored (Tavasszy et al., 2016). By contrast, the water infrastructure sector in flood-prone European countries has prioritized climate adaptation on political and policy agendas, shifting towards integrated flood risk management (Restemeyer et al., 2024).

Although road and water infrastructure sectors are often managed by the same authorities (e.g. the Netherlands), cross-sectoral learning remains limited and difficult (Arts et al., 2016). These difficulties can potentially be explained due to differences in the policy paradigm in which both sectors operate. Hall (1993) described a policy paradigm as an interpretive framework of ideas that enables or constrains the way in which policy problems are perceived and how they should be governed, how policy goals are formulated and which policy instruments are used for attaining the formulated goals. Within this definition four interrelated components of policy paradigms can be found: an interpretive framework, policy objectives, an instrument logic and the role of governance institutions (Kern et al., 2014).

This study is focused on the interpretive frameworks of both the water and road infrastructure sector. Based on Hall's (1993) conception of policy paradigms, we define the interpretive framework as a set of ideas and perspectives through which policymakers perceive, define, and address policy problems. This framework influences the selection of policy goals, the preferred instruments for attaining these goals and the role employed by governance institutions. Therefore, it enables and constrains the policy choices made within a prevailing policy paradigm (Hall, 1993; Capano and Howlett, 2024).

The aim of this study is to analyse the ideas, values and perspectives that shape the different climate adaptation discourses of water and road infrastructure providers in the Netherlands and to deepen our understanding of what constitutes an interpretive framework as part of policy paradigms. We deliberately focus on the Netherlands as both water and road infrastructure has received international acclaim and are considered advanced (Arts et al., 2016; OECD, 2014; WEF, 2019; Zevenbergen et al., 2013). To this end, we will employ a Q-methodology consisting of several steps (Busscher et al., 2022). First, we analyse policy documents from both the water and road infrastructure sector and select a series of statements. Second, we develop a matrix accommodating the statements using a 7 point Likert scale. After that, we conduct interviews with professionals from both sectors to fill out the Q-sort by letting respondents prioritize the statements. Finally, we analyse the data using Ken-Q-analysis software.

The expected outcomes of this Q-methodology analysis will provide insights into the different discourses or interpretive frameworks on climate adaptation within the water and road infrastructure sectors. By identifying distinct groups based on shared viewpoints, the study will reveal clusters of professionals who align with particular discourses. These groups may differ in their perceptions of climate risks, preferred adaptation strategies and the role of governance institutions in implementing adaptation measures. The findings will contribute to a more nuanced understanding of policy paradigms and highlight potential barriers and opportunities for cross-sectoral learning. Additionally, the study is expected to inform policymakers about the diversity of adaptation discourses within infrastructure sectors, offering pathways for fostering collaboration and integrating perspectives across policy domains. Ultimately, this research will deepen our understanding of the different discourses and interpretive frameworks guiding the transition to climate adaptive infrastructure networks.

With enhanced inter-city connectivity and extended urbanization, cities were expanding beyond their traditional city limits to become global city-regions through metropolisation (Scott, 2001). It has led to the bursting open of city-region boundaries, where cities and city-regions in proximity merge into vast, complex, and often cross-border territories (Brenner, 2019). These processes pose challenges for governance and planning across jurisdictions worldwide (Harrison & Gu, 2021; Loh & Goger, 2020; Yan & Growe, 2022). Against this backdrop, critical questions arise: How do supra-regional and intra-regional public actors navigate rescaled territories and engage with relational networks? What dynamics and hidden politics shape the governance of such complex regions during the metropolisation process in different geopolitical contexts?

To address these questions, we employed social network analysis to examine historical state-local political interactions in two cross-jurisdictional metropolitan regions: the Yangtze River Delta (YRD) in China and the Metropolregion Rhein-Neckar (MRN) in Germany. The findings, based on content analysis of regional policies and key-insider interviews, reveal that regional territories have emerged as platforms for accommodating diverse interests, and supra-regional actors (e.g., the State and higher-level governments) act as strong drivers for collective actions in both metropolitan regions. Intra-regional actors (multi-level governments) perform multiple brokerage roles, including liaison, coordinator, gatekeeper, and representative, within regional governance networks.

To further understand the mechanisms behind these dynamics, we compared the continuities, discontinuities, and underlying cartographic representations in three versions

of trans-regional plans in YRD, approved by China's central government, with two versions of trans-regional plan in MRN, supported by the State Treaty co-signed by three German states. The results highlight dynamic institutionalization in both cases, along with state-orchestrated regional cooperation in establishing legally binding plans across jurisdictions. However, a key contrast emerges: while the megaregional practices of the YRD exemplify government entrepreneurship, the MRN case underscores the influential role of global enterprises in shaping regional development.

Our paper contributes to the existing literature on cross-jurisdictional governance and explores the combination of territorial and relational perspectives in analyzing and comparing state-local interactions and governing roles in different cases. Ultimately, these understandings of dynamic geopolitical processes in governing complex regions call for more systematic research and international comparisons across multiple cases.

Navigating Conflicts and Paradoxes. Analyzing the Interaction of Urban Regeneration, Local Governance, and Public Policy in the Tirana Riverside Project

Author: Doriana Musaj¹

¹ *Polis University*

Corresponding Author: doriana_musaj@universitetipolis.edu.al

The covid-19 pandemic of 2020 hit Albania just three months after the earthquake of 29 November in the Durrës area, with 54 victims and hundreds of buildings damaged. The two crises reshaped the terrain of the political agenda toward the territory in terms of both more centralizing planning policies and the decision-making processes of rebuilding and renewal. The author believes that, for urban renewal and regeneration projects to work successfully, we need to design plans that takes into account the social, cultural, and historical background of the neighborhood or the area under rebuilding. The research underscores the importance of comprehending tensions generated during urban planning and the rebuilding process in Albania. It delves into the complex interaction between urban regeneration, urban planning policies, and the instruments used by

the government and the center. Using theoretical frameworks based on urban regeneration experiences, the complex landscape of conflicts within the territory, stemming from the transformation of technical disputes into political discussions, was examined. The study chosen for this research article, is a case study-research, located in Tirana, Albania. Identified as the "Tirana riverside" project by Stefano Boeri, which involves a 29-hectare urban regeneration plan of a new "green neighborhood" as a response to the earthquake. The new neighborhood is designed to be self-sufficient, equipped and designed as a smart city that will be able to cope with both seismic and pandemic emergencies. The project aims to create a resilient urban environment that reflects the diverse needs of its residents while fostering a sense of community and connection to nature, including the Tirana River as an integral part of it.

This study employs a mixed-methods approach, integrating qualitative and quantitative data from empirical research to elucidate the intricate relationship between technical and political instruments utilized in urban planning and renewal. It examines the public policy tools applied during the urban regeneration process, as demonstrated in the case study.

The results that come from the juxtaposition of empirical data with those from primary sources (neighborhood residents), and secondary (official documents) reveal not only the complexity of the process of reconstruction and renewal with urban development (social, economic and cultural), but also emphasize the importance of the involvement of stakeholders in the planning process. The tensions generated during the process of expropriation and reallocation of residents, have been the focus of interviews with residents to also address the *sui generis* conflict for the area under study.

This study adds to the ongoing conversation about urban renewal and regeneration processes, the decision-making models that go along with them, and urban planning policies by using real-life data from Tirana Riverside. In summary, this study highlights the importance of embracing the complex nature of urban planning, positioning these complexities as catalysts for innovation rather than obstacles to progress.

Governing climate adaptation: technical and institutional en-

ablers from Bologna's transformational case

Author: Vittore Negretto¹

¹ *Iuav University of Venice*

Corresponding Author: vnegretto@iuav.it

This paper examines governance structures and institutional learning in urban transformation processes for climate change adaptation, focusing on Bologna's experience within the European Urban Initiative. This program has funded 22 innovative projects across European cities, and Bologna's TALEA is currently in the early stages of its journey, laying the foundation for future physical and social transformations of urban space.

The TALEA project addresses the pressing challenge of urban heat islands, a growing concern for Mediterranean cities facing increasing climate impacts. At its core, the project introduces the concept of "green cells"—100x100-meter interventions embedded within the dense urban fabric to integrate targeted greening solutions. These interventions aim not only to mitigate urban heat effects but also to strengthen overall urban resilience. However, the project's significance goes beyond its technical aspects; it prioritizes a participatory and collaborative governance approach. Public authorities, research institutions, implementation partners, and local communities actively contribute to co-designing and co-creating these transformations, emphasizing an inclusive and sustainable vision for urban planning.

TALEA's governance model is built on multi-level collaboration between local authorities, research institutions, and international city partners, facilitating the exchange of knowledge and best practices across borders. The project serves as a case study for trans-boundary planning and policy transfer, as partner cities in France, Romania, and Latvia engage in knowledge-sharing and explore the applicability of Bologna's approach within their own urban contexts. This highlights the role of flexible governance structures and informal networks in advancing adaptation solutions beyond rigid institutional frameworks.

While urban greening has become a priority in European policies and national strategies, integrating these interventions into public and private urban transformation processes remains a challenge. Bologna's experience illustrates the interplay between soft knowledge—such as governance processes, participatory co-design, and stakeholder collaboration—and hard knowledge, including the technical design and implementation of greening measures. Both dimensions are crucial for the success of transformative urban actions.

By examining the relationship between regulatory frameworks and participatory governance, this paper explores the enabling conditions and institutional barriers that shape the implementation of urban greening projects in dense Mediterranean cities. It raises key questions for broader European applicability: What lessons can Bologna's early experiences offer to other cities embarking on similar initiatives? What challenges arise in the initial phases, and how can they be effectively addressed? What governance structures and innovative solutions can support cities in overcoming barriers and driving long-term urban transformation?

This paper contributes to the broader discussion on governance and institutional change in urban planning by exploring how multi-level collaboration, participatory governance, and transnational learning shape urban adaptation to climate challenges. By reflecting on these dynamics, it seeks to deepen our understanding of governance mechanisms that can accelerate sustainable urban transitions across Europe.

Public-Private Joint Ventures in Urban Development: Identifying and Governing Value Tensions

Author: Paul van den Bragt¹

¹ *Delft University of Technology, Department of Management in the Built Environment, section Urban Development Management*

Corresponding Author: p.vandenbragt@tudelft.nl

Urban development in the Netherlands increasingly addresses a wide range of societal challenges, including housing shortage, sustainable energy transition, social inequalities, and climate change adaptation and mitigation. As a result, development processes have become increasingly complex. This complexity has led to a renewed interest in Public-Private Partnerships (PPPs) as governance strategies in Dutch urban development to leverage the strengths of both public and private sectors in pursuing shared objectives and creating public value (BPD, 2023; Hümmels, 2017; Kort and Klijn, 2011; Ten Have et al., 2017). A trend that aligns with the New Public Governance discourse, which advocates for more networked forms of collaboration between public and private actors to address today's wicked problems, emphasizing the importance of cooperation, co-production and shared responsibility rather than hierarchical control or purely contractual relationships (Ansell and Torfing, 2020; Krogh and Triantafillou, 2024).

However, concerns persist about potential tensions between public and private values within partnerships. Public-Private Joint Ventures (PPJVs), in particular, face criticism for governance designs that distance local politics from operational decision-making, benefiting progress and efficiency on the one hand, but potentially undermining values such as democratic legitimacy, transparency, and accountability on the other (European Commission, 2004; Reynaers, 2014). Another critique is that the differing organizational cultures and objectives of public and private actors can lead to conflicts over priorities and decision-making processes, potentially undermining the effectiveness of the partnership and putting public goals or values at stake (Van der Wal, 2008). However, studies identifying and providing overview of the key value tensions in urban development partnerships are lacking. Furthermore, the dichotomous market versus state perspective and respective value differences are primarily theoretically grounded, and –certainly in the urban development context –has been demonstrated to a limited extent empirically.

Great scholarly attention has been given to critical success factors for the performance of PPPs across sectors, often categorized into two main groups: those based on contractual governance (e.g. clear contracts defining allocation of risks and responsibilities, application of sanctions, performance metrics) and those rooted in relational governance (e.g. trust, communication, openness) (Warsen et al., 2019; Koppenjan et al., 2022). Still, there remains a significant gap in understanding the contractual and relational governance conditions that drive the performance of networked PPPs that go beyond contractual relationships, which are particularly evident in urban development. Moreover, there is limited empirical evidence of how contractual and relational governance elements relate to value tensions.

The aim of this contribution is twofold. Firstly, by identifying the key value tensions specifically within PPJVs through a literature review and semi-structured interviews with professionals experts. Secondly, it aims to explore how these value tensions become evident and relate to contractual and relational governance conditions in Dutch urban development.

The findings reveal that PPJVs can mediate value tensions while maintaining effectiveness by finding the right balance between contractual governance and relational governance. Structured agreements play a role in aligning financial objectives with societal goals through balanced risk-sharing and contractually defined goals, while keeping contracts as light as possible preserves efficiency, effectiveness and the ability to navigate based on relational norms. Contractual control mechanisms such as an independent director, external audits and internal checks can safeguard public values like transparency and accountability, reduce the likelihood of opportunistic behaviour and mitigate value tensions. Contractual and relational governance conditions relate to how value tensions are evident in urban development, and can simultaneously provide opportunities and actionable perspectives to address them. By elucidating this interplay, the paper informs

the design of effective governance structures for contemporary urban development challenges that support public value creation.

Multi-Level Collaborative Governance for Environmental and Climate Adaptation: Insights from EU-funded Projects

Author: Stefano Magaudo¹

Co-authors: Federica Di Pietrantonio¹; Serena Muccitelli¹; Carolina Pozzi¹

¹ *Department of Architecture, Roma Tre University*

Corresponding Authors: serena.muccitelli@uniroma3.it, carolina.pozzi@uniroma3.it, stefano.magaudo@uniroma3.it, federica.dipietrantonio@uniroma3.it

This contribution presents a critical reflection on the implementation and outcomes of several EU-funded projects (Life and Interreg), developed by the authors, which have supported the establishment of an innovative collaborative and adaptive environmental governance that have stimulated a governance system by integrating formal regulatory frameworks with voluntary agreements and community-driven initiatives that operate across multiple levels of governance.

Specifically, this governance framework is structured on two interrelated levels. At the regional level, governance mechanisms include “Pacts”, open and permanent working groups where relevant stakeholders share common environmental and adaptation goals by signing a voluntary agreement, and “Environmental Contracts”, voluntary governance tool that engage institutions, local authorities, associations, and citizens in a participatory process to promote the sustainable management of a water basin, integrating water resource protection, hydrogeological risk prevention, ecological and landscape enhancement, and socio-economic development (Bastiani, 2011). Examples include the “Pact for Biodiversity” developed within the Life Greenchange project (2018 -2023), the “Pact for Pollinators’ Adaptation to Climate Change” from the Life BEEadapt project (2022 -ongoing) and the “Agro Pontino Coast Contract” developed through the Interreg Med Coasting project (2018 -2019) and through regional funding programs. At the local level, “land stewardship agreements”, a voluntary governance tool that fosters collaboration between landowners, public institutions, and local organizations to promote the sustainable management and conservation of natural and cultural landscapes through long-term, participatory commitments (Sabaté et al., 2013), have been promoted by Life Greenchange project, Life BEEadapt project and by the Interreg EuroMed Coastrust project (2024 -ongoing).

This contribution explores this multi-layered governance system from the perspective of the research group actively involved in these processes, highlighting critical tensions, challenges, opportunities and potential trajectories emerging from the intersection of institutional structures and community practices fostering transformative action for environmental sustainability and climate adaptation.

One of the key challenges in implementing collaborative governance is ensuring the sustained engagement of diverse stakeholders. While actors are often involved in the strategic planning phase, difficulties arise in securing long-term participation during the implementation and management of interventions. This underscores the need for governance mechanisms that go beyond formal agreements and embed inclusive, bottom-up decision-making processes.

To address these challenges, the research group has experimented with innovative approaches aimed at enhancing active engagement of local stakeholders. In this framework, Pacts and Environmental Contracts (at regional level) act as catalysts for adaptive and collaborative land stewardship practices (at local level). In particular, land stewardship agreements activate mechanisms of continuous collaboration and interaction among public institutions, associations, and economic actors while promoting innovative models of territorial management.

Specifically, this contribution presents the methodological approach and preliminary results of the EU Interreg Coastrust and Life BEEadapt projects, that starting from a climate change adaptation action program, are now developing community empowerment processes and testing innovative governance solutions that strengthen capacity to manage socio-ecological transitions of institutions and communities.

Collaborative governance through the Mediterranean: Framing a Community of Practice for Wetland Contracts

Authors: Elisa Avellini¹; Romina D'Ascanio¹

Co-authors: Anna Laura Palazzo¹; Giancarlo Gusmaroli²; Stefano Magaudo¹

¹ *Department of Architecture, Roma Tre University*

² *Mediterranean Wetland Initiative (MedWet)*

Corresponding Authors: g.gusmaroli@ecoingegno.it, romina.dascanio@uniroma3.it, elisa.avellini@uniroma3.it, stefano.magaudo@uniroma3.it, annalaura.palazzo@uniroma3.it

Wetlands are vital ecosystems, supporting 40% of global biodiversity while providing essential services such as flood regulation, carbon storage, and water purification. Despite their significance, wetlands rank among the most endangered habitats worldwide. Over the past 50 years, more than 35% have been lost due to urbanization, agricultural intensification, and pollution. In Europe, nearly half of all wetlands have disappeared since the 20th century, with the Mediterranean region facing particularly acute threats. These challenges are exacerbated by the intensification of agriculture and inadequate water management, intertwining ecological and governance concerns that demand innovative and collaborative solutions.

Wetland Contracts have emerged as effective tools for governing wetland areas. Although they are formally recognized only in France, Belgium, and Italy, Wetland Contracts provide a structured yet flexible framework for stakeholders, including landowners, local governments, and private organizations, to negotiate shared goals for wetland preservation and sustainable use. They exemplify bottom-up governance by aligning biodiversity conservation with sustainable practices such as eco-tourism and agriculture. The WE GO COOP project adopts a dual-level approach to strengthen and expand the use of Wetland Contracts. This strategy combines upscaling the tool through the creation of a Community of Practice (CoP) at the Mediterranean level and downscaling it to new contexts, including Croatia, Portugal, Albania, and regions in the South and Middle

East Mediterranean. Simultaneously, the project aims to reinforce the tool in countries where it has already been tested, such as Italy, Greece, and Spain. This transnational cooperation allows WE GO COOP to address wetland challenges at scale while ensuring the adaptability of its governance models to diverse local contexts.

At the core of the project's upscaling efforts is the establishment of a Community of Practice (CoP), a transnational network of policymakers, researchers, practitioners, and local communities. The CoP fosters dialogue, knowledge exchange, and the dissemination of best practices, supporting the development and implementation of participatory governance tools like Wetland Contracts. It represents a collaborative space where stakeholders can bridge gaps between scientific research, policy frameworks, and community action, facilitating multi-level and multi-stakeholder collaboration.

One of the project's milestones was the first thematic seminar, "Framing the Community of Practice," held in Rome. This event provided a platform for stakeholders to discuss shared challenges, define governance objectives, and explore strategies for enhancing wetland management. The seminar highlighted the critical need for tools that enable collaboration across sectors and levels of governance, while integrating diverse perspectives into decision-making processes.

A key deliverable of the project is the development of a virtual collaborative platform designed to support the CoP's activities. The platform serves as a centralized repository of information and resources on signed Wetland Contracts at the Mediterranean level, together with relevant guidelines and handbooks. It facilitates continuous interaction, capacity-building, and the sharing of knowledge among CoP members, regardless of their geographical location. By integrating these resources into an accessible digital space, the platform enhances the effectiveness, scalability, and transferability of collaborative governance practices.

This work presents the first results of the project and illustrates how the virtual platform functions as a pivotal tool for advancing wetland governance. By enabling the CoP to access, share, and co-create knowledge, the platform plays a central role in addressing the ecological and socio-economic challenges faced by wetlands in the Mediterranean and beyond.

Establishing the foundations for a Transnational Network for Integrated Spatial Planning. Preliminary efforts and insights

Authors: Yannis Paraskevopoulos¹; Stefanos Tsigdinos¹; Sofia Tsadari²; Dionisia Koutsi²; Ioannis Chatziioannou³

Co-authors: Thanos Vlastos ¹; Efthimios Bakogiannis ¹

¹ *Department of Geography and Regional Planning, National Technical University of Athens*

² *commonsplace co-op*

³ *National Technical University of Athens*

Corresponding Authors: koutsi@commonsplace.gr, stef.tsigdinos@gmail.com, ioannis.gits@gmail.com, vlastos@survey.ntua.gr, ebako@mail.ntua.gr, parask.yannis@gmail.com, tsadari@commonsplace.gr

Planning cities and communities is a rather complex matter, encompassing different dimensions and aspects (urban, transport, environmental, etc.). The traditional approaches dealt with these aspects in isolation, thus ignoring interdisciplinary effects and interactions. In contrast, recent approaches prioritise integrated solutions that holistically deal with urban space. To that end, there is a compelling need to promote initiatives that bring “Integrated Planning” to the forefront. In this context, this study aspires to establish the foundations for fostering an Integrated Network that brings together various stakeholders including individuals and organisations/associations. This network will be a conglomerate of local communities comprising diverse members (policy, academia, civic society and planners) that will cooperate and share knowledge. Herein, Integrated Planning is defined as a concept entailing Urban, Mobility, Participatory and Evidence-based planning and “integration” is envisioned under a threefold framework: a) Discipline-based, b) Method-based and c) Role-based.

However, when it comes to establishing such a holistic and diverse network, a robust conceptual framework outlining the organisational model and the basic principles should be developed. Furthermore, successful and active networks necessitate “room” for allowing their members interact and exchange experiences and insights. Finally, a transnational, cross-cultural and cross-sectoral community shall be based on a participatory learning approach, fostering inclusivity and strong bonds between the members. Bearing upon those key points, this presentation will focus on the activities performed to articulate a coherent Charter entailing the vision, mission, and strategic objectives of this Network. More specifically, this Charter will detail the governance structure, roles, and responsibilities of various stakeholders, and establish clear protocols for decision-making processes. Next, this presentation will also demonstrate the “Virtual Knowledge Hub” consisting of a Wiki-Repository and an Open Learning Platform that is addressed to multiple target groups such as academics, students, learners, researchers, practitioners, policymakers, local administrators, etc. Last but not least, there will be a brief description of the Participatory approach guide, a step-by-step guide with material and resources that will horizontally run all activities of the Network, to promote inclusion and democratic participation in all Network’s activities and especially in the knowledge co-creation and sharing process.

Through establishing a robust conceptual and organisational framework, this research study will lay the proper ground for a Transnational Network for Integrated Spatial Planning destined to promote “Integrated Planning”. Apparently, this endeavour represents the first attempt to establish such a network, clearly oriented toward fostering “Integrated Planning”. Although challenging, this initiative would be very crucial for all aspects of planning, i.e., research projects, planning schemes, educational activities, and civic engagement, going beyond traditional approaches and embracing a new planning culture. This Network is expected to be a platform for intermingling different voices related to planning and a game-changer towards sustainability and inclusivity.

T_04 GOVERNANCE (A) / 1759**Enhancing Land-Use Governance in Estonia: The Need for Standardised Terminology and Data Integration****Author:** Kärt Metsoja¹**Co-author:** Evelin Jürgenson¹¹ *Estonian University of Life Sciences***Corresponding Authors:** evelin.jyrgenson@emu.ee, kart.metsoja@emu.ee

Despite numerous initiatives at the European level to reduce land take, built-up areas continue to expand more rapidly than population growth throughout Europe (Schiavina et al., 2022). Legal and policy frameworks at the EU, national, and local levels outline land protection, soil management, and ecosystem restoration obligations. Moving forward, cities will increasingly need to redevelop within their existing footprints rather than expand into greenfield sites (Decoville and Feltgen, 2025). However, the effectiveness of measures to improve land-use efficiency depends on coherent implementation, robust governance structures, and sufficient monitoring capacities.

In Estonia, an ongoing research and development project is underway to create a comprehensive understanding of land-use needs by integrating economic, environmental, and social perspectives (R&D project: Land and soil use). The study has highlighted significant discrepancies in how stakeholders interpret key land-use concepts. A fundamental prerequisite for effective governance is a shared and standardised understanding of these terms. Political objectives often conflate land cover, land use, and land condition, leading to terminological ambiguity—an issue already noted in previous research (Marquard et al., 2020). This lack of clarity may result in inconsistencies in policy implementation and monitoring. Additionally, it is crucial to identify which national or European data sources are best suited for specific monitoring tasks, as a universal “one-size-fits-all” solution does not exist.

For example, the Corine Land Cover database indicates approximately 26km² of land artificialisation in Estonia between 2012 and 2018. In contrast, the LULUCF data from the climate report for the same period shows an increase of 101 km² in the settlement area, highlighting a fourfold discrepancy (Jürgenson et al., forthcoming).

Similar inconsistencies arise when comparing land take and soil sealing, two key concepts in urban development. While land take refers to converting natural or agricultural land into built-up areas, soil sealing covers the soil with impermeable materials, such as concrete or asphalt (Prokop et al 2011). These differences matter—not just in technical definitions, but also in how we measure and manage urban expansion, infrastructure growth, and environmental protection.

Estonia clearly needs an integrated data approach that extracts the most valuable insights from different datasets while maintaining a clear distinction between land use, land cover, and ecosystem conditions. For example, suppose certain land-use features (such as roads and buildings) are updated frequently at the national level, the integration process should prioritise this high-resolution data while using broader European datasets to supplement areas where national data has worse temporal resolution.

The added value of Section 106 Agreements and CIL in England

Authors: Kaio Nogueira¹; Yiquan Gu¹; Angelique Chettiparamb¹

¹ *University of Reading*

Corresponding Authors: k.m.nogueira@henley.reading.ac.uk, a.chettiparamb@reading.ac.uk, yiquan.gu@henley.reading.ac.uk

Land Value Capture (LVC) mechanisms, such as Section 106 agreements (S106) and the Community Infrastructure Levy (CIL), are widely regarded as crucial tools for funding urban development by redistributing the value generated through public investments in England. While much of the existing literature has focused on the economic implications of these instruments—particularly their effects on developers and landowners—limited attention has been given to their equity outcomes or their contributions to spatial and social justice within local contexts. This study directly addresses this research gap by examining how S106 and CIL contribute to equitable development across England, with a specific focus on justice and fairness in the distribution of public benefits.

To address this, the paper applies Nancy Fraser's three-dimensional framework of social justice—redistribution, recognition, and participation—integrated with concepts of spatial justice (Fraser, 2008). This combination allows for a comprehensive analysis of the geographic distribution of benefits, the cultural-status implications of LVC policies, and the decision-making processes shaping their implementation. While S106 agreements focus on site-specific impacts, such as affordable housing and infrastructure provision, CIL operates as a broader, flat-rate tax to fund community-wide infrastructure. However, disparities in policy design, market conditions, and institutional capacity raise concerns about whether these mechanisms are capable of achieving their intended equitable outcomes.

This study adopts a mixed-methods approach, using the Digital Land database, which records 22,786 developer contributions across 62 local authorities in England between 2010 and 2025. The research addresses two core questions: (1) What types of benefits have been funded through S106 and CIL across Local Planning Authorities (LPAs)? (2) How are these benefits distributed spatially within selected LPAs, and what does this reveal about spatial justice? Geospatial analysis will map the distribution of benefits, while qualitative interviews with decision-makers in 20 LPAs will explore the institutional and procedural factors influencing these outcomes.

Existing research indicates significant disparities in how benefits are allocated. Stronger

housing markets more effectively leverage S106 contributions, even in conjunction with CIL, while weaker markets struggle to capture similar value (Lord et al., 2022). In such cases, the justice potential of these instruments seem to be conditioned to local contingencies and market dynamics. By linking the variation in public benefits to differences in local market conditions, institutional frameworks, and decision-making processes, this study sheds light on the challenges and opportunities for designing LVC policies that promote more equitable urban development.

Ultimately, this research contributes to the broader understanding of if and how LVC mechanisms can address systemic inequalities and promote justice in urban development. By examining both spatial and social dimensions of equity, it aims to inform the design and implementation of LVC policies that better balance economic objectives with the principles of justice and fairness in England.

Construction of Regional Multi-dimensional proximity Network from the Perspective of Collaborative Agglomeration

Author: Guyue Sun¹

Co-author: Hong Jiang¹

¹ *Southeast University*

Corresponding Authors: geniesun0110@163.com, jianghongseu@163.com

This study focuses on the construction of regional multi-dimensional proximity network and the application of collaborative agglomeration between regions, aiming to rethink the regional construction model and promote fair distribution of resources.

This study focuses on the construction of multidimensional proximity networks in regional areas and the exploration of their application in fostering regional collaborative agglomeration, with the ultimate goal of reimagining rural network models and ensuring equitable resource distribution.

By integrating complex network theory with the direct application of multi-dimensional proximity principles, the study delves into the network structure characteristics across various proximity dimensions in regional settings through the utilization of correlation network models and other analytical tools. These dimensions encompass geographical proximity, social proximity, institutional proximity, and cognitive proximity. In constructing these multidimensional proximity network at the regional scale, geographical proximity networks take into consideration factors such as water network density, settlement scale and hierarchy, spatial integration, and spatial accessibility. Meanwhile, social and institutional proximity networks encompass political policies, village regulations, clan relationships, social organization ties, and industrial development policies. The cognitive proximity network, on the other hand, captures the subjective cognitive level of villagers through comprehensive questionnaire surveys. Geographical proximity facilitates collaborative development by leveraging geographical similarities, while social and institutional proximity strive for consistency in technological advancements and development directions. Cognitive proximity embodies the internal

driving force of development and seeks ideological alignment. The study endeavors to identify whether the village is suitable for collaborative construction, thereby providing a scientific foundation for rural area development. The study is aimed at developing a versatile methodology for delineating regional clusters across a vast array of urban and rural areas, transcending administrative boundaries to foster coordinated regional development centered around cultural or industrial hubs.

The study uses Xinghua City, Jiangsu Province, China, as a case study. This study area, characterized by its dense water network and frequent inter-village communication within the Lixiahe region, serves as an exemplary context for studying rural multidimensional proximity networks. Study has found that in areas with high geographical proximity, due to geographical or spatial similarities, there is no necessary connection in village development, and the overall distribution shows a “core—correlation—edge” distribution. Villages with high social and institutional proximity have a high sense of cultural belonging and corresponding industrial development directions, such as having a unified fishery industry chain from aquaculture and processing to packaging and e-commerce sales, and have high potential for collaborative development. Villages with high cognitive proximity have a higher acceptance of village cooperation and collaborative development due to the influence of villagers’ education level and economic cognitive ability, and their high support can promote further agglomeration and collaborative development of villages.

Strategic metropolitan governance for resilience in practice: The Barcelona Metropolitan Commitment 2030 and the governance model in the German Metropolitan Region Rhein-Neckar

Authors: Oriol Estela Barnet¹; petra schelkmann²

¹ General Coordinator of the Barcelona Metropolitan Strategic Plan, Spain; member of the ARL International Working Group “Resilient Metropolitan Regions

² Director Planning of the Verband Region Rhein-Neckar, Germany; chair of the ARL International Working Group “Resilient Metropolitan Regions

Corresponding Authors: petra.schelkmann@vrrn.de, oestela@pemb.cat

The Metropolitan Commitment 2030 is a strategic framework led by the Metropolitan Strategic Plan of Barcelona (PEMB) which aims to create a more sustainable, equitable, and resilient metropolitan region by 2030, aligning with global objectives such as the United Nations’ Sustainable Development Goals (SDGs). At its core, the Commitment integrates a mission-oriented approach, which focuses on tackling complex, systemic challenges through collaborative, goal-driven efforts. Rather than addressing issues in isolation, this approach defines 8 specific missions—multidimensional objectives that engage diverse stakeholders, including public administrations, businesses, academic institutions, and civil society. These missions act as guiding beacons, fostering innovation, coordination, and shared responsibility across the metropolitan ecosystem.

The metropolitan region Rhine-Neckar is one of 12 officially recognised European Metropolitan Regions in Germany since 2005. The region is characterised by its unique regional cross-border governance with innovative integrated governance models and is fully responsible for the cross-border regional planning (land use planning) which belongs to the region in accordance with the State Treaty between the three Federal States Hesse, Rhineland-Palatinate and Baden-Württemberg. Therefore the region is also described as a pioneer of co-operative federalism in Germany. The case study

shows how transnational cooperation is organised and implemented in the metropolitan region and how well this model works in practice with regard to resilient spatial and governance structures.

Youth participation in Structural Transition in Lusatia, Germany: Race Up Together or Race to the Bottom Alone?

Authors: Rafael Maximiliano Flores de Leon¹; Tihomir Viderman²; Silke Weidner²; Hendrik Weiner²

¹ *BTU Cottbus Senftenberg*

² *BTU Cottbus-Senftenberg*

Corresponding Authors: weidner@b-tu.de, hendrik.weiner@b-tu.de, viderman@b-tu.de, floreraf@b-tu.de

The involvement of young people in urban development is mandated by the UN Convention and has become a normative goal in regional and urban planning. This goal resonates in particular with the debates on urban commons, which emphasize the importance of engaging young people in shaping shared urban spaces, extending the concept of commons beyond lived experiences to the domain of shared urban futures. The way futures are imagined, articulated, and enacted reflects governance structures, public spaces, and the lived realities of urban dwellers. Futures are bound to places and frame how humans collectively or individually settle their space. In regions undergoing structural transition, youth participation is recognized by stakeholders as vital for crafting regional futures because it is young people who will inherit the region that is designed today. Yet, in practice, youth participation often falls short of its promise due to systemic and cultural barriers.

This paper examines youth participation in Lusatia, Germany, focusing on structural transition policies and their mechanisms on the side of institutional frameworks, as well as the perceptions, concerns, and aspirations of young people as they navigate the structural transition in their region. Drawing on qualitative data from regulatory frameworks, interviews, and focus groups, it situates youth participation at the intersection of urban realities and imaginaries, revealing a disconnect between policy frameworks and young people's lived experiences. Policies often emphasize abstract notions of economic and social restructuring, framed through quantitative metrics, while young people primarily engage with ramifications of structural transitions through direct interactions with their immediate environment. It is through everyday life experiences of the multiplicity of patterns and rhythms of urban space that they shape their understanding of structural transitions and their sense of agency within them.

Key findings highlight that young people frequently identify the lack of cultural capital as an obstacle to meaningful participation. They lack the means to effectively translate their experiences into the structured discourses of participatory processes. Many struggle to engage with institutionalized frameworks that focus on technical conceptualizations of urban space and temporality. Two concerning tendencies may be observed. First, a growing acceptance among youth that their voices will not be heard. Despite strong interest in participatory governance, young people express skepticism rooted in past experiences of limited follow-through and a perceived disregard for their input. This skepticism, coupled with a perceived disinterest in institutional participatory processes,

perpetuates cycles of disengagement. Second, the opposition to welfare benefits, which many young people perceive as overly generous and discouraging hard work. Referring to their own economic conditions, which they perceive as precarious, they argue welfare benefits unfairly reward those who do not contribute. This criticism reflects growing resentment toward the welfare system and risks fueling a broader decline in social protections. Combined with falling trust in planning processes, these attitudes create fertile ground for radical-right mobilization, particularly in the context of rising extremism in the region.

While positive regional changes, such as environmental improvements and economic diversification, are acknowledged, these are often overshadowed by uncertainties about individual prospects and future stability, which are frequently tied to inherited traditional views of employment and family life. The findings underscore the importance of meaningful participation in empowering youth to engage in structural change, ensuring that by playing an active role in shaping shared futures, they collectively redefine the commons as spaces of mutual interest rather than competing individual priorities.

Spatial Planning and Experimental Governance: A Bioeconomy Framework for Sustainable Transformation

Author: Palmira De Almeida¹

¹ *University College Dublin, School of Architecture Planning and Environmental Policy*

Corresponding Author: palmira.dealmeida@ucdconnect.ie

Spatial planning is a complex process deeply rooted in institutional contexts, playing a pivotal role in facilitating societal transitions towards sustainability. The governance structures shaping planning are influenced by a network of institutions, regulations, and procedures, which determine the decision-making processes around land-use and spatial configurations. Planning institutions are central to local and infrastructure development. Transformative policy agendas, such as the bioeconomy, hold promise for designing and planning pathways towards enhanced sustainability. However, the implementation of sustainability visions and goals by institutions is often hindered by rigid frameworks, fragmented governance, and a lack of cross-sector coordination. These challenges stem from different views on sustainability, limited control over the private sector, and slow political decision-making. The governance frameworks provide the necessary structures to put policy visions like the bioeconomy into practice, enabling their application across diverse contexts. Therefore, implementing alternative governance frameworks that prioritise sustainability is crucial and could enhance the planning system's effectiveness. Experimental governance (e.g. testbeds, innovation districts, and living labs) and strategic spatial planning can help dismantle entrenched practices, foster learning, and enable institutional flexibility. Experimental governance often involves collaboration between stakeholders from the public, private, academic, and non-profit sectors to drive sustainable transformations. These collaborations aim to facilitate co-creation through decentralised decision-making and action processes, raising questions about interests, conflict resolution, and power dynamics. This paper examines the relationship between planning systems and sustainable transitions, focusing on the bioeconomy as a key driver for change. It explores how experimental governance can contribute to institutional reform, overcoming conflicts, and the promotion greater coherence in policy implementation, helping to actualise visions like the bioeconomy as a workable solution for ongoing sustainability challenges at different scales of governance.

Civic initiatives, urban regeneration and urban planning participative processes: from collaborative to prefigurative frames.

Author: Carla Tedesco¹

Co-authors: Medea Ferrigno ²; Stefania Marini ¹

¹ IUAV University of Venice

² Università IUAV di Venezia

Corresponding Authors: ctedesco@iuav.it, smarini@iuav.it, mferrigno@iuav.it

This paper explores the possibility of scaling up experimental practices emerging from civic initiatives by incorporating them into participatory urban planning processes linked to the construction of wider urban/territorial strategies. The hypothesis of this paper is that in order to enable this scaling up of civic initiatives, participatory processes need to be rethought and innovated, moving from a collaborative planning framework (Healey, 1997; Forester, 1999) to the concept of prefigurative planning as proposed by Davoudi (2023).

Focusing in particular on the practices of reuse of abandoned spaces and buildings and their transformation in 'creative hubs', the main idea underlying this paper is that re-generated spaces can be seen as "forerunning practices" (Tedesco, 2023), where future transformations are prefigured and enacted in the present.

Using Beauregard's (2013) distinction between site, context and place, this idea is tested in terms of whether it is possible to identify different roles played by this type of reused space within participatory urban planning processes.

This theoretical framework is applied to some case studies in Italian cities that are carrying out urban planning processes for the design of new urban master plans.

In particular, within these processes creative hubs are considered to be places, but their potential to scale up innovative practices is often not considered: they are not recognized as potential triggers for broader urban regeneration strategies but are instead treated both as project sites and places where institutions can organize meetings with citizens.

On the other hand, the Italian case studies highlight the importance of planning frameworks in supporting the transition from localised experimental practices to broader visions. For those seeking to promote innovative urban change - whether as activists, designers, administrators or public officials - it is essential to broaden participatory processes to better incorporate grassroots innovation. In particular, effective scale-up requires moving away from the traditional sequential approach of plan-project dynamics. Instead, projects need to be allowed to anticipate and inform the vision of planning tools, rather than being limited to temporary experiments.

Formal participation in environmental assessments. Examining the case of large-scale linear infrastructure projects.

Author: Philipp Kerschbaum¹

¹ *TU Berlin*

Corresponding Author: philipp.kerschbaum@tu-berlin.de

Environmental assessments (EAs) serve as key instruments for evaluating the socio-environmental impacts of large-scale infrastructure projects (Hanna and Arnold, 2022). They are essential for the implementation of energy and mobility projects as part of a sustainability transformation. Public participation is a crucial component of EAs, offering opportunities for stakeholders to engage, shape their environment, and influence decision-making (Sinclair et al., 2022).

However, formally implemented public participation in EAs is often criticised as insufficient –too late in the process, with no possibility to alter a project, and not designed for everybody, just to name a few (Doelle and Majekolagbe, 2023; Elling and Nielsen, 2018). This contribution investigates how legally regulated participation processes in EA procedures align with the criteria of “good” participation outlined in the literature. The goal is to develop a systematic approach for identifying gaps in legal participation frameworks and EA practices that can be applied across different countries.

The contribution focuses on environmental impact assessments of linear infrastructures in Germany where railway, road, and power grid projects undergo a formal approval process called the Planfeststellungsverfahren. These processes are complex, time intensive, involve numerous stakeholders and have to deal with diverse spatial impacts (Gharehbaghi et al., 2022).

The research follows three steps: First, key elements of public participation in EAs will be identified through a structured literature review of key publications. Second, the legal foundations of planning approval procedures and publicly available guidelines from permitting authorities will be analysed to determine at what process stage which form of public participation is mandated. Current debates on streamlining and the simplification of planning and assessment processes (given their potential impact on public participation) will also be considered. This analysis will be conducted through systematic, category-led document review and expert interviews.

Two outputs are expected: First, a process visualisation of the stages of planning and assessment showing when forms of formal public participation occur. Second, a list of criteria for good public participation and whether they are met by just fulfilling formal

requirements. It is expected that processes that only fulfill the minimum formal requirements, fail to meet essential participation criteria in EAs. The identified gaps provide a basis for further research on non-formal participation methods and their potential to enhance the quality of environmental assessment.

Rethinking Policy Learning in Urban Policy Mobility

Author: Byeongsun Ahn¹

Co-author: Yuri Kazepov¹

¹ *University of Vienna*

Corresponding Author: byeongsun.ahn@univie.ac.at

The question of how policy learning affects the localization of globally circulating policies has been central to our understanding of urban policy mobility. Within the policy mobilities literature, scholars from various disciplines, ranging from anthropology to geography and sociology to urban planning, have captured the interconnected urban processes and outcomes of global policy circulation, wherein policy actors learn and move policy ideas from place to place through global networks of policy communities.

Yet, this understanding of policy learning in urban policy mobility only limitedly describes the policymaking behaviors and learning activities of policy elites that primarily occur in the earliest moments of its overall experience. In practice, their localization in the actual policymaking context will feature more complex adaptive dynamics and interactions, in which various learned lessons and their (uneven) deliberation flow constantly between its constitutive stages. It entails multiple forms of knowledge exchange between a diverse range of policy actors from different governance levels with varying capacities to influence specific components of the whole policy cycle. Together, they will have a special consequence for the localized process and outcome of urban policy mobility.

In these reflections, this article explores diverse patterns of policy learning and their implications for policy outcome as an international 'best practice' not only travels to and arrives in a city, but also lives through multiple interrelated stages of its life cycle. The purpose is to highlight how multiple types of learned lessons, drawn from diverse sources of knowledge, become (differently) enmeshed, streamlined and articulated into the local formulation and implementation of a traveling policy practice, extending beyond the initial encounters of policy elites with its simplified narrative of success. It argues that the way in which the specific capacities of policy actors intersect with prevailing contextual circumstances at the local level will have a significant influence on the translation of learned lessons into concrete substances for policy outcome.

The case of participatory budgeting for climate change adaptation (*Wiener Klimateam*) from Vienna, Austria, adds an empirical dimension to this theoretical approach. The empirical findings presented zoom the relationship between policy learning and policy outcome in *Wiener Klimateam* into five separate –yet interrelated– stages of its overall budgeting cycle (issue-framing; instrument selection; participatory process; output implementation; and evaluation) vis-à-vis the actors, sources, types and effects of policy learning. By doing so, the discussion of these findings connects the recent theoretical advances in the literature on policy learning within the broader policy sciences with the remaining issues and gaps in extant research on urban policy mobility.

Ways of learning in urban governance experiments: Insights from the Vienna Climate Team "Wiener Klimateam"

Author: Anna Caroline Aigner¹

¹ TU Wien

Corresponding Author: anna.aigner@drei.at

In the face of pressing social and environmental challenges, experimental interventions –such as real-world laboratories, urban living labs, niche experiments and demonstration projects– are increasingly being recognised as important drivers of transformative urban change. In particular, experiments with co-creative governance are expected to trigger learning processes that challenge inflexible administrative structures by promoting adaptable and solution-oriented strategies.

Although learning is considered a central component of these urban experiments, it is rarely explicitly and systematically investigated in the scientific literature. There is a large discrepancy between studies that focus on urban experiments and those that explicitly address the learning processes in these experiments.

Addressing this research gap, the paper uses the example of the Vienna Climate Team (*Wiener Klimateam*) –an innovative governance experiment for the co-productive development of climate-relevant projects– to examine how the process design and project structure of an experimental process influence different forms of learning at different levels. The Vienna Climate Team is characterised by the active involvement of different actors, from municipal departments and districts to political decision-makers and citizens and has explicitly placed the promotion of learning processes at the centre.

Methodologically, the research is based on a qualitative case study that includes document analysis, participant observation and focus interviews with institutional actors involved in the experiment. To capture the multi-layered learning processes in the context of urban governance experiments, the study draws on theoretical concepts of social learning, transformative learning, organisational learning and process learning.

The results show that learning processes manifest themselves differently depending on

the design of the experimental arrangements in various phases of the process. The study highlights various learning arenas that were created by the specific structure of the Vienna Climate Team and analyses their influence on individual and collective learning processes. The analysis identifies three central learning strands: learning collaborative decision-making, transdisciplinary co-productive collaboration and communication, and internal administrative learning processes and institutional change.

Based on the insights gained, concrete tactics for the effective design and implementation of co-creative governance experiments are derived. The proposed analysis will not only advance the theoretical discussion of learning in experimental governance approaches, but also provide practical insights for the design of urban transformation processes. It emphasises the importance of consciously and systematically integrating learning processes into the design and implementation of urban governance experiments and contributes to the further development of the theoretical discussion on learning in experimental governance approaches.

Institutional and community learning for transformative urban practices: Experiences from Area Based Initiatives in Trondheim, Norway

Author: Rolee Aranya¹

Co-authors: Cinthia Freire Stecchini¹; Ami Joshi¹; Mirkeivan Sayyar Kavardi¹

¹ *Norwegian University of Science and Technology*

Corresponding Authors: cinthia.f.stecchini@ntnu.no, rolee.aranya@ntnu.no, amikjoshi@gmail.com, mirkeivs@stud.ntnu.no

The article builds on two generations of Area Based Initiatives (ABIs) in Trondheim from 2013, that are being implemented in neighborhoods where the Municipality has identified quality of life challenges as well as urban physical degradation. The first program of this kind was implemented in the twin-neighborhoods of Saupstad-Kolstad from 2013 – 2021 and with three new ABIs ongoing in the neighborhoods of Tempe-Sorgenfri, Lademoen and Møllenberg from 2024. ABI as a methodology for urban regeneration has been adopted and promoted by the Norwegian Housing Bank and the State (including the Ministry of Municipal Affairs) for various urban neighborhoods that fare poorly on national quality of life statistics.

Goals of the ABIs in Trondheim have widely acknowledged that cross sectoral and public-private- civil society based partnership models for urban regeneration, such as in the Norwegian ABI model, require both institutional and societal learning and capacity building. Municipal staff involved in the first and second generation of ABIs in Trondheim often reflect more on the “internal” municipal learning than the tangible projects in the localities. Goals of the first generation ABI in Saupstad-Kolstad included: Contribution to interaction, collaboration and coordination across disciplines and sectors; Dialogue, communication and local anchoring and participation in connection with all public activities, competence development and learning.

This article is based on interviews with the municipal staff that have been involved in both generations of ABIs in Trondheim, supplemented by other documentations and evaluations of the first ABI completed in 2021, to present narratives that reflect learning -institutional, inter-institutional and community based -and analyse them in terms of the limits and potentials of their ability to be transformative.

The paper is position in literature related to territorial social innovation (e.g. Van Dyck and Van den Broeck, P., 2013), earlier discussion on the transformative potential of ABIs (e.g. in Hovik et al, 2024) and concepts of critical pedagogy applied to place-making and

urban renewal projects (e.g. in Natarajan and Short, 2023).

Some of the findings from the interviews indicate that sustainability of community learning was dependent on the permanence of collective organisations and on individuals. Initiatives involving youth for example were dependent on their continued presence in the neighborhood, while initiatives involving housing cooperatives have led to more continued learning. Some of the barriers to achievement of community learning have been the gap between the strategic goals of the program to build local responsibility and the perception of the community actors that the support and resources made available would support long-term direct transfers. In terms of inter and intra-organisational learning, the impact of the first generation of ABI has been the acceptance of iterative engagement with community groups, anchored in neighborhoods rather than as sectoral engagement at city level. However, despite the demonstration of the benefits of cross-sectoral, place-based engagement in the ABI, the project management group has still had to use substantial resources for anchoring the second generation ABIs internally within the municipality and among the various public and private institutions in the city, putting in doubt the sustainability of organisational learning.

Transformative planning or a vicious circle - cities running ahead or running alone?

Authors: Christian Lamker¹; Marian Counihan¹

¹ *University of Groningen*

Corresponding Authors: m.e.counihan@rug.nl, c.w.lamker@rug.nl

The world becomes urban, the majority of people live in cities, and we speak of an 'urban age'. Planning as transformative action, especially towards and in a future post-growth society, involves motivating and engaging urban imaginaries. While some of them remain hidden in urban theory and associated role perceptions of planners and policy-makers, so do we see imaginaries driving cities to action. Supported by European and international frameworks, new models from research, or funding mechanisms, some cities seem to lead the discourse around core questions of the urban future. For post-growth planning, this could be the application of Kate Raworth's doughnut economics in cities like Amsterdam, but also some local initiatives within URBACT. Beyond these examples, a wide range of networks mushrooms to foster local actions, participation, and democracy, such as the European Capital of Democracy.

Against much emphasis on 'the urban', cities as a spatial form occupy only a little part of our common space while their impact reaches way into its surroundings here now in the same way as elsewhere and in the future. Both from a spatial and a relational perspective, cities are not closed, but deeply intertwined with hinterlands, remote areas, and the systems necessary for their own existence and reproduction. They are more than a set of buildings: sites for democracy, places for active citizenship and opportunities for making and claiming rights. But what are the limits to making urban politics within the territorial limit of a city? We build this contribution on an interdisciplinary seminar

series on the question “Where is Urban Politics?” in Groningen in 2024 and 2025, crossing boundaries between philosophy, urban politics, and spatial planning. We use post-growth thoughts to complement critical questions about how we can positively re-gain democracy and governance in cities while not leaving our common foundation beyond cities out of sight. Literally said, not running alone somewhere, but moving together collectively. What needs to change in the self-understanding of planners and city makers, to achieve this?

Discourses of green transition challenging institutionalised spatialities of planning and governance

Author: Raine Mantysalo¹

Co-authors: Pia Bäcklund²; Vesa Kanninen²

¹ *Aalto University*

² *University of Helsinki*

Corresponding Authors: pia.backlund@helsinki.fi, raine.mantysalo@aalto.fi, vesa.kanninen@helsinki.fi

In Finland, the established institutional frameworks and practices of spatial governance have generated a fairly stable regional order of core-periphery relations. Now this order is being challenged by the green transition and associated new technologies and market opportunities. Areas formerly peripheral have emerged as new centres of attention for green investments. What are the institutional and practice implications of these shifts in regional economy to spatial governance, both at the national and local level? How is this development understood in the central government, and brought forward to guiding and incentivising regional development? How do local governments in affected regions react to these changes and navigate amidst them, in view of tapping into the scales, networks and institutional resources they bring forth?

Drawing on Discursive Institutionalism and Practice Theory, we conceptualise institutions as dynamic systems evolving through the interplay of ideas, norms, and policies. New ideas of spatial governance, e.g., related to the green transition, rarely institutionalise so as to replace former institutions, but rather generate a new institutional layer of spatial governance and lead to hybridisation of spatialities. By examining accounts of local and national planning interactions, we identify patterns of institutional and policy adaptation and spatial reconfiguration in accommodating to the green transition and related sustainability discourses. We contribute to spatial planning and governance research by offering conceptual tools to sort out the complex geographies of established and emerging spatial discourses in the era of green transition.

Coastal Governance in the Adriatic-Ionian Region: A comparative analysis of Spatial Planning Systems and Integrated Coastal Zone Management implementation

Authors: Giulia Motta Zanin¹; Donato Casavola²; Erblin Berisha²

¹ *Polytechnic University of Bari*

² *Politecnico di Torino*

Corresponding Authors: erblin.berisha@polito.it, giulia.mottazanin@poliba.it, donato.casavola@polito.it

Integrated Coastal Zone Management (ICZM) is an essential tool for ensuring sustainability and effective governance in coastal areas, particularly in regions facing high anthropogenic pressure and environmental vulnerabilities and uncertainties such as the Adriatic-Ionian Region. However, the implementation of its principles and recommendations still shows great difficulties.

This study conducts a preliminary comparative analysis of coastal planning systems in seven Adriatic-Ionian countries—Albania, Bosnia and Herzegovina, Croatia, Greece, Italy, Montenegro and Slovenia—within the framework of the ICZM Protocol in the Mediterranean.

The research aims to explore how the selected countries have engaged with the Protocol, analyzing both ratification status and subsequent actions. Through a comparison of national responses—whether through direct Protocol implementation or alternative coastal management strategies—the study reveals patterns of convergence and divergence in coastal policy approaches. This comparative analysis yields insights into effective coastal governance practices across the Adriatic-Ionian Region.

The study employs a comparative methodology based on seven case studies, providing a tentative evaluation of policy documents, legal frameworks, and spatial planning instruments related to coastal zone management. It also examines the key actors and stakeholders involved in decision-making processes, emphasizing their role in shaping coastal governance.

The preliminary findings highlight the challenges and opportunities associated with sustainable integrated coastal management in the Adriatic-Ionian Region, contributing to the broader discourse on coastal governance and the influence of international legal frameworks on national policy development. The study also provides recommendations for future research and reflects on the prospects for greater integration and coordination among coastal planning systems in the Adriatic-Ionian Region.

Patterns of establishing and conducting cross-border cooperation: Insights from Poland's borderlands

Author: Sylwia Dołzbłasz¹

Co-authors: Andrzej Raczyk¹; Małgorzata Leśniak-Johann¹

¹ *University of Wrocław*

Corresponding Authors: malgorzata.lesniak-johann@uwr.edu.pl, andrzej.raczyk@uwr.edu.pl, sylwia.dolzbłasz@uwr.edu.pl

Border areas exhibit unique characteristics in the formation of cooperative relationships, influenced by the interplay of international and national conditions at central, regional, and local levels. Additionally, the existence of the border as a barrier in many dimensions, including spatial, economic, socio-cultural, plays a very strong role. Under these conditions, the initiation and subsequent continuation of cooperation are critical elements. The purpose of the study was to identify patterns (paths) in establishing and maintaining relations as well as formulating the scope of joint projects undertaken within the framework of cross-border cooperation. Specific objectives included identifying approaches to forming project consortia, defining the project scope, understanding the rationale for continuing joint activities, and identifying the characteristics of an 'ideal' cooperation partner. This study is embedded in the cooperation studies pursued in the context of cross-border multi-level governance. The results obtained are intended to support the governance policies of cross-border areas and the exploitation of their potentials.

The spatial scope of the analysis covered all land borders of Poland, including the internal borders of the EU and the Schengen Zone (with Germany, Czechia, Slovakia, and Lithuania) and the external ones (with Ukraine, Belarus, and Russia), which are excellent examples of bordering and debordering processes. Additionally, the studied borderlands, understood as areas on both sides of the Polish border, are characterized by great diversity due to environmental, economic, and cultural features.

Mix Method Approach was used. Thus, a two-stage exploratory sequential research design included quantitative data analysis of 1577 cross-border projects and 2307 organizations that implemented them as well as 26 in-depth interviews with selected entities (using content analysis). Projects implemented under the European Territorial Cooperation 2007-2013, the European Neighborhood and Partnership Instrument 2007-2013, Interreg 2014-2020 and the European Neighborhood Instrument 2014-2020 were taken into account.

T_04 GOVERNANCE (A) / 123**Cross-Border Data Management: Enhancing Collaboration and Sustainable Development in Border Regions****Authors:** Nataliia Yehorchenkova¹; Oleksii Yehorchenkov¹¹ *SPECTRA Centre of Excellence EU at Slovak University of Technology in Bratislava***Corresponding Authors:** oleksii.yehorchenkova@stuba.sk, nataliia.yehorchenkova@stuba.sk

Border regions, often characterized by unique socio-economic dynamics and shared governance challenges, require robust data management systems to foster cross-border collaboration and sustainable development. This research investigates the purpose and implementation of data management practices in border regions of different countries, focusing on their potential to address cross-border challenges and leverage opportunities for growth.

The study adopts a mixed-method approach, combining qualitative analysis of governance frameworks with quantitative assessment of spatial, demographic, and socio-economic datasets from selected border regions. Key objectives include identifying barriers to data sharing, understanding the impact of legal and technical discrepancies, and exploring innovative solutions to enhance data interoperability and standardization.

Principal results reveal significant challenges in data management stemming from disparities in legal systems, technological infrastructure, and data governance policies. These factors hinder efficient data sharing and joint decision-making among cross-border stakeholders. However, case studies demonstrate that emerging technologies, such as geographic information systems, blockchain, and big data analytics, can bridge these gaps by enabling integrated data platforms. Stakeholder engagement and capacity-building initiatives were found to play a crucial role in overcoming institutional and technical barriers.

Analysis of recent research underscores the relevance of data management to cross-border governance. Xue et al. (2024) emphasize the importance of cross-border interactions in advancing sustainable development, highlighting the role of collaborative data management in achieving global sustainability goals. Krüger et al. (2024) propose a framework for cross-border governance, identifying critical factors such as institutional alignment and shared data systems, which support this research's focus on governance improvement. Kurowska-Pysz et al. (2018) examine sustainable planning strategies for cross-border cooperation, advocating for enhanced spatial data integration and collaboration between border cities. Leibenath (2008) offers theoretical insights into the gaps in cross-border governance and spatial development, underscoring the need for robust data-sharing protocols and interoperable technologies to bridge these divides.

The research concludes that effective data management in border regions not only facilitates sustainable development but also strengthens governance by enabling informed policymaking, efficient resource allocation, and enhanced social cohesion. Recommendations include the development of standardized data-sharing protocols, investment in interoperable technologies, and the establishment of cross-border data governance frameworks. These measures are essential for transforming data into a strategic asset for border region development and integration.

Beyond Formal Structures: The Role of Institutionalised Support Centres in Cross-border Cooperation Governance in Italy

Authors: Marco Del Fiore¹; Luca Cestaro¹

Co-author: Loris Servillo ¹

¹ *Politecnico di Torino*

Corresponding Authors: marco.delfiore@polito.it, luca.cestaro@polito.it, loris.servillo@polito.it

The European Union has witnessed a significant evolution in cross-border cooperation governance in recent years, encompassing various institutional mechanisms and arrangements. Interreg programs, Macroregional strategies, the b-solutions project, and more complex institutional cooperation structures such as Euroregions and European Groupings of Territorial Cooperation (EGTC) demonstrate that the territorial collaboration landscape has become increasingly articulated and mature. With its strategic geographical position, Italy participates in numerous cross-border initiatives along its Alpine and maritime borders, highlighting the growing importance of institutionalized cooperation frameworks.

While research has extensively analysed formal cooperation structures and their legal frameworks, the role of support organizations and informal networks in facilitating cross-border cooperation remains understudied. These entities, including cross-border information centres, civil society organizations, and advisory bodies, operate as binational or multinational non-profit organizations. They are characterized by their cross-border focus, institutionalized nature, and advisory function supporting the Four Freedoms of the European Single Market, serving as vital intermediaries between different levels of territorial governance.

This paper examines the interaction between formal cooperation structures and support institutions in Italian cross-border regions through a multidisciplinary approach, combining a taxonomic analysis of existing realities in the national case with specific case studies. The research investigates how these organizations support cross-border cooperation in three key areas: strategic planning, stakeholder engagement, and administrative and cultural barrier reduction. The study explores the contribution of various institutions, including Euradria in the Italian Slovenian context, ARGE ALP in the Alpine area, the TEIN network, and research centers such as Eurac and Informest.

The findings reveal that support organizations are crucial facilitators for successful cross-border cooperation, particularly in providing information, technical assistance, and stakeholder coordination. The analysis of Italian cases demonstrates their significant contribution to overcoming administrative, cultural, and operational barriers that often hinder cross-border initiatives. Furthermore, the research highlights how these organizations enhance EU cohesion policy implementation by providing specialized expertise and facilitating multilevel governance processes. The study contributes to the theoretical understanding of cross-border governance mechanisms beyond more formal and institutional frameworks. It provides evidence-based recommendations for strengthening the institutional framework of cross-border cooperation, ultimately improving the effectiveness of European territorial integration.

Crossing Invisible Lines: Navigating Governance and Cooperation Across Subnational Boundaries

Author: Anna Growe¹

Co-author: Evelyn Riemer¹

¹ Kassel University

Corresponding Authors: evelyn.riemer@uni-kassel.de, anna.growe@uni-kassel.de

Border regions often face particular challenges, especially with regard to governance structures, institutional framework conditions and interregional cooperation. These problems concern both international borders, as addressed in the context of EU initiatives such as INTERREG, and intra-national borders, for example between federal states. While national borders have long been addressed in research, the focus on intra-national borders has so far been less pronounced.

The so called “(economic) region of the centre”- located at the interfaces of the three federal states of Hesse, Lower Saxony and North Rhine-Westphalia - illustrates the complexity of intra-national borders as social and institutional constructs. Due to the federal administrative structure in Germany, the federal state borders are of great importance for planning processes. It is obvious that formal planning processes are influenced by the federal state borders. However, non-formal planning processes - such as regional development processes - are also strongly influenced by the federal state borders, even though common problems exist in border areas along the federal state borders, which in principle should also be addressed together.

As part of the Strategic Regional Development Concept (SREK) in the cross-border region between Hesse, North Rhine-Westphalia and Lower Saxony, several analyses were carried out to examine the interactions between key players such as regional management, economic development agencies and chambers of industry and commerce. Based on qualitative interviews with economic and planning actors in the study area, social and semantic network analyses were conducted and statements were made about key topics and actors as well as their interactions within and across federal states.

The results show that interactions often end at administrative borders, while cross-border cooperation is hampered by institutional fragmentation and a lack of policy coordination. While the EU explicitly addresses national borders in the context of the INTERREG programme, in other EU programmes such as the LEADER initiative, intra-national borders already pose enormous challenges for the development and implementation of innovative governance models in (intra-national) border areas.

The presentation discusses the methodological approaches of network analysis with regard to their theoretical foundation and possible applications in regional science. The results of the analysis show the challenges for central key actors and their interactions in intra-national cross-border interactions. From a network perspective, the article shows how governance structures and political coordination in border regions are structured and challenged by federal state borders.

Strategic Regional Planning and the Role of Regulatory Instruments: Insights from the Emscher Transformation

Authors: Benno Schroeder¹; Martin Schinagl²

¹ *TU Dortmund University*

² *Leibniz Institute of Ecological Urban and Regional Development*

Corresponding Authors: benno.schroeder@tu-dortmund.de, m.schinagl@ioer.de

Strategic regional planning is driven and implemented by a network of institutional actors with diverse interests embedded in a specific institutional setting (Purkarthofer et al., 2021). This contribution examines the relationship between such planning actors and their respective institutional context, particularly regarding the impact of regulatory instruments on decision-making processes and the orientation of regional spatial planning.

The TEMPUS case study project focuses on the Emscher transformation, a long-term infrastructural and ecological process to convert a river formerly used as an open sewer in Europe's largest industrial region into a near-natural watercourse. This serves as an example to investigate the relationship between regulatory instruments such as the European Water Framework Directive and the strategic decision-making of institutional actors that shaped the outcome of the river conversion.

The primary focus lies on the water management association *Emschergenossenschaft*, whose structure and actions are significantly affected by legal frameworks. Acting as a governance instrument, the association operates within an institutional context, enabling the realization of complex regional strategy formation (Wiechmann, 2008). One objective is the further development of the process model (ibid.) to explain such strategizing processes. In these processes of strategic planning, conflicting spatial interests across various levels, scales, and territorial boundaries are mediated and reconciled (Mäntysalo et al. 2019). On the one hand, the *Emschergenossenschaft* is a product of the institutional context that created it; on the other hand, it functions as an autonomous entity and a driver of transformative action (Zimmermann, 2023). How regulatory instruments influence regional development depends on the extent to which organizations comply with and implement these regulations.

This contribution examines the impact of specific regulatory instruments, particularly the legal framework governing water and wastewater management, on actors' behavior within the strategic regional planning process of the Emscher transformation. As a key outcome, it aims to formulate hypotheses on the interplay between the institutional setting—especially regulatory instruments—and actors' strategic decision-making in the context of the Emscher transformation.

Mobilising Territorial Actors: a comparison between two development policies

Author: Andrea Di Bernardo¹

¹ DIST, Polytechnic and University of Turin

Corresponding Author: andrea.dibernardo@polito.it

The proposal draws on Italy's National Strategy for Inner Areas (SNAI), a place-based policy designed to address the multifaceted development challenges faced by Italy's inner areas, which are often characterized by demographic decline, geographic isolation, and inadequate access to essential services. SNAI represents a novel policy framework in Italy that emphasizes the importance of participatory development, particularly through its co-design phase, which seeks to involve local communities and stakeholders actively in shaping developmental trajectories. This approach underscores a combination between top-down policy implementation and a more inclusive, bottom-up model aimed at fostering local development of marginal areas, through the improvement of essential service such as health, education and mobility.

Central to the research is a qualitative evaluation of the SNAI's co-design phase implemented in an inner area of Aosta Valley, a mountainous region in Northwestern Italy. This case study highlights critical limitations both in the national application of the policy and within the specific local context. Using qualitative research methods, the study examines the participatory frameworks employed by the SNAI and compares these with the LEADER approach implemented by LAG EVV operating in a mountainous territory in the neighbouring region of Piedmont, to identify key lessons and transferable practices. Rather than suggesting a wholesale integration of LEADER principles into the SNAI framework, the analysis focuses on specific mechanisms, such as fostering local networks and leveraging community assets, that could potentially strengthen the participatory dimensions of SNAI.

Stretching from the Mediterranean Sea in the south-west to the Danube plains in the north-east, the Alpine region is one of the most complex and heterogeneous territories in Europe. While there are numerous contributions dealing with the development dynamics of the peri-Alpine lowlands and the inner-Alpine highlands, so far hardly any attention has been given to these territories in between. We argue that these interface territories constitute a specific spatial category, which is generally perceived either as peripheral from a mountain perspective or as suburban from a core city perspective. Putting them at the centre of territorial development and policy analysis can help to address spatial development challenges.

Alpine interface territories connect mountainous and inner-Alpine areas with pre-Alpine lowlands. They are characterised by highly dynamic flows and interdependencies as well as by controversial stakeholder claims that meet in a rather limited spatial framework (Chilla & Streifeneder 2018). Organising sustainable spatial development in this geographical context requires rethinking spatial governance and planning from a functional, soft perspective (Allmendinger et al., 2015; Faludi, 2018; Cotella, 2023) that goes beyond traditional administrative and sectoral boundaries and employs multilevel, integrated strategies and actions.

The proposed contribution draws on the results of the ESPON InTerAlp project (Chilla et al., 2024) to explore the functional and governance interlinkages, at first through a pan-Alpine overview and then through selected case studies. The analysis shows that, on the one hand, the spatial governance and planning systems of the Alpine countries do not dedicate particular attention to Alpine interface territories. On the other hand, the empirical evidence collected in the cases of the Alpine Rhine Valley, the Turin Metromountain area, and the Munich-Tyrol area shows that there are promising episodes of dedicated functional governance exist that could inspire more decisive progress and, overall, a more integrated sustainable and inclusive development of the Alpine region.

T_04 GOVERNANCE (A) / 1531**Consultocracy in urban regeneration. The case of Poland****Author:** Przemysław Ciesiółka¹¹ *Adam Mickiewicz University in Poznan***Corresponding Author:** przemko@amu.edu.pl

Urban regeneration has become a leading spatial development direction due to the social, political and economic changes brought about by transforming the post-socialist system in Central and Eastern Europe (Hlaváček et al., 2016). It was characterised by rapidly changing management and planning contexts in line with the Western solutions model (Scott, Kühn 2012). A long-term and comprehensive view of urban development processes was adopted, opening up new possibilities for managing complex change and addressing many problems associated with urban decline. The basis for action in Poland was the regeneration programmes implemented by local authorities. These documents were to be developed by local officials in line with the idea of community-led regeneration. This approach was supported by a training system offered by national and regional authorities. Despite this, regeneration programmes were mainly developed by consultants, leading to the emergence of a consultocracy. A clear decoupling between state intentions and real action is therefore evident. Craig and Brooks (2006) define consultocracy as a process in which unelected consultants replace policy debate by publicly accountable politicians". Gunter et al. (2015) identify consultants as external knowledge actors who trade in knowledge, expertise and experience and, through consulting as a relational transfer process, influence organisational structures, systems and goals. As Ylönen & Kuusela (2018) note, consultocracy has had a significant qualitative impact on the ways in which public administration is run and managed in various areas, such as auditing, organisational restructuring, human resources and information and communication technology.

The paper aims to identify the causes of consultocracy in regeneration programming in Poland, referring to the decoupling phenomenon. The work draws on in-depth interviews with key actors (officials, planners and consultants) in the process. Results of the research indicate that consultocracy and decoupling are determined by 1) the shortage of municipality employees and a deficit of suitably educated personnel 2) the objective benefits associated with the involvement of consultants, such as their neutrality, their different and high-level skills and their ability to transfer good practices and 3) fear among local officials of taking responsibility for preparing the regeneration programme.

T_04 GOVERNANCE (A) / 151**Actors in power networks: an institution framework of historic urban district renovation actors in China****Authors:** Xin Li¹; Christa Reicher¹¹ *RWTH Aachen University***Corresponding Authors:** xin.li1@rwth-aachen.de, reicher@staedtebau.rwth-aachen.de

The actor constellation plays an important role in urban studies. Understanding actors' power resources and mindsets is of fundamental importance in explaining their behaviours and actions in historic urban district conservation, renovation, and redevelopment as well as urban issues on a wider scope. This paper aims to offer a panoramic description framework and also reflections regarding the power resources, interrelations, institutional organization, mindsets, and action logic of key actors, exemplified by the Chinese historic urban district renovations. Referring to a bounded-rational hypothesis and Michael Mann's power network theory, the paper provides a theoretical framework in actor-institution analysis and summarizes the complex, chaotic, and intertwined connections among actors in the real world into four main institutionalized socio-spatial networks of power: political network, everyday-living network, economic network, and expertise network. The paper will further describe the power source and organizational structure of each network and how the networks, to a certain extent, have shaped the mindset and behaviour of the actors. In the end, the study will point out the challenges for historic urban district renovation in the Chinese context from an actor-institutionalism perspective such as the imbalanced power distribution and party-state authority fragmentation. The theoretical framework on actor power networks can be referential to a wide range of global urban studies related to actor mindsets and behaviours beyond China and the reflections can be insightful for context understanding regarding contemporary urban renovation cases in China.

T_04 GOVERNANCE (A) / 996**Distinguishing Change from Transformation in South Africa's Spatial Transformation Journey****Author:** Kundani Makakavhule¹**Co-authors:** Kwazi Ngcobo¹; Mark. C Oranje¹¹ *University Of Pretoria***Corresponding Authors:** mark.oranje@up.ac.za, kundani.makakavhule@up.ac.za, kwazi.ngcobo@up.ac.za

South Africa's 31 years of democracy have been characterized by robust legislative efforts to address spatial inequalities entrenched by apartheid. Policies such as the Constitution of the Republic of South Africa (1996), the White Paper on Housing (1994), the Municipal Systems Act (2000), and the Spatial Planning and Land Use Management Act (SPLUMA, 2013) have laid the groundwork for spatial transformation. Complementary tools like the Spatial Transformation Barometer developed by the Council for Scientific and Industrial Research (CSIR) and the South African Local Government Association (SALGA) have sought to define metrics and benchmarks for progress. However, while these frameworks emphasize the "what" of spatial transformation, little attention

has been given to the “how” and “where.” Fundamental questions—whether to relocate marginalized communities closer to economic centers or redistribute industries and services to peripheral areas—remain unanswered. Additionally, the distinction between spatial transformation and incremental spatial change is often blurred.

This study examines these gaps through spatial analysis and interviews conducted with officials across 20 municipalities in South Africa. Findings reveal that spatial transformation has been slow and, in some cases, stagnant due to deeply rooted structural and systemic challenges. Political interference often skews priorities toward short-term agendas, while a lack of political will limits decisive action against entrenched inequalities. Municipalities also face critical shortages of skilled professionals, economic constraints, and competing demands for basic service delivery. The urgent focus on housing and infrastructure maintenance frequently prioritizes quantity over strategic location, perpetuating spatial fragmentation.

Drawing on the conceptual distinctions between change (incremental, surface-level, and minimal cultural/identity shift) and transformation (deep, systemic, and new paradigm shift), this paper argues that achieving spatial transformation requires not only adaptive governance and cross-sectoral collaboration but also an all-systems approach that integrates economic, social, and spatial considerations into a cohesive framework.

Spaces of exchange?: Reciprocity and public engagement in a Bristol regeneration context - a framework analysis

Author: Danielle MacCarthy^{None}

Co-authors: Andy Gibson ; Jo White

Corresponding Authors: jo.white@uwe.ac.uk, d.a.maccarthy@uva.nl, andy.gibson@uwe.ac.uk

Public engagement is readily placed in defacto and binary categories of ‘good’ and ‘bad’ practice. At its best, scholarship demonstrates the major benefits of resilience and well-being enacted through procedural justice, inclusion and placemaking. More commonly however, practice is dismissed as performative and a tick box exercise, highlighting schisms in practice and rhetoric and is one way. Historically, criticism has stemmed from an overrepresentation of engagement of the ‘usual suspects’—i.e. more educated, affluent, older and often white and male sections of the population. However, procedural limitations are also levelled at public engagement strategies with respect to eliciting broad public visions as contributions but lacking direct avenues for influence and genuine participation. Despite concepts of reciprocity implicitly involved in debate about practice, only a small number of empirical studies have applied a framework by investigating notions of the reciprocity within the planning system and fewer still in terms of public participation. In this paper, we outline the development of a three-tiered reciprocity typology; direct and indirect, encompassing the ‘how’; instrumental and symbolic reciprocity, encompassing the ‘what’; and lastly, balanced, generalised and negative, regarding ‘impact of exchange’. Applying a qualitative framework analysis, we present findings from focus groups (n=4) with public participants and interviews (n=7) with urban planning practitioners involved in a pre-consultation engagement. We argue that a reciprocity framework enhances understanding of symbolic versus authentic practice, articulating greater nuance involved in public engagement planning, and trace how the implicit reciprocal flows set up a cascade of interactions affecting the most basic premise for trust and exchange between planning governance engagement practices and the public.

Aspirations for meaningful engagement can be challenging in resource constrained local government settings and necessary compromises may impact the effectiveness of engagement activities. However, a greater clarity about the purpose of engagement

through awareness of reciprocal exchanges could help to prioritise activities and lead to greater sensitivity for public engagement. Our findings are relevant for concepts of 'whole- of-society' approaches in achieving healthy communities.

Stakeholder Dynamics in Government-Led Gentrification: Case Studies from Urban Renewal in Beijing

Author: Haocheng Guo¹

¹ *University of Sheffield*

Corresponding Author: hguo29@sheffield.ac.uk

Gentrification, a term first introduced in 1964, initially referred to the process of middle-class re-entry and transformation of working-class communities in central London (Glass, 1964). Over time, the concept has expanded beyond the return of capital to cities or the pursuit of specific lifestyle by the middle class (Zhang et al., 2014). Today, gentrification is increasingly linked to urban renewal policies and, driven by government initiatives, has become a global urban strategy to attract capital investment (Lees, 2000; Smith, 2002). Its manifestations vary significantly across countries and economic systems (He, 2019). In China, as the world's largest developing country, gentrification is frequently employed as an urban renewal strategy, leveraging land reuse to generate capital accumulation (Li et al., 2018). However, existing research offers limited comparative analyses of urban renewal models across different contexts, particularly regarding the interplay between gentrification and renewal strategies.

This study focuses on government-led residential renewal projects in China's authoritarian context, exploring the roles and strategies of various stakeholders in the gentrification process. It aims to contribute new perspectives for both the theoretical understanding of gentrification and the practical application of urban renewal initiatives. Two representative cases in Beijing are analyzed: Yuer Hutong in Nanluoguxiang and Courtyard No. 58 on Jiaoda East Road. The former represents a top-down policy-driven renewal model, while the latter reflects a bottom-up development approach. By investigating the interaction among state, market, and society, and how these interactions influence the gentrification process, this research provides empirical evidence for understanding the diverse pathways of urban renewal in China.

This study employs qualitative research methods, including random and snowball sampling, to conduct in-depth interviews with key stakeholders, such as residents, shop owners, street committee staff, and planning and design professionals. Data analysis is conducted using triangulation to ensure robustness. The findings reveal that while the government plays a dominant role in urban renewal strategies involving gentrification, the opinions and actions of developers and residents significantly influence renewal model within the policy framework. Furthermore, while gentrification can drive economic growth, it also bring certain negative social impacts.

By analyzing government-led urban renewal models that incorporate gentrification as a core strategy, this study reveals the complex relationships among stakeholders and their impact on renewal approaches. It offers practical recommendations for future residential urban renewal planning, emphasizes the adoption "mild gentrification" as a policy strategy to achieve sustainable and efficient urban renewal.

The cultures of temporary urbanism intermediaries in France: exploring the dilemmas of hybrid civic action

Author: Francesco Campagnari¹

¹ *École des hautes études en sciences sociales*

Corresponding Author: francesco.campagnari@ehess.fr

Temporary urbanism in planning and governance processes has been the subject of extensive research in recent years. While temporary uses have always existed in our cities, short-term events—such as temporary construction and space usage—have increased in frequency. This phenomenon has become known as temporary urbanism (Madanipour, 2017). These practices have shifted from marginal informality to tools in mainstream urban policies to experiment with the reactivation of spaces (Galdini, 2020). These projects have increasingly been carried out through hybrid formats (Andres and Zhang, 2020): they are integrated into top-down policies, programs, and evaluations but are executed on the ground by organisations specializing in the temporary management of vacant spaces. These organisations act as intermediaries between owners and users. (Vivant, 2022). These organisations can include professionalised artistic collectives, as well as new urban professionals inspired by spaces of artistic critique (Pinard and Vivant, 2017) or by publications on the experimental value of temporary uses (Ferrerri, 2015). These hybrid projects are seen as contradictory, blending different worlds and contexts. They enact at the same time the horizon of a just city and a creative (and neoliberal) city (Bragaglia and Rossignolo, 2021). Temporary urbanism intermediaries may, for example, provide shelters for migrants, aligning with Lefebvre’s concept of the right to the city, while also promoting their methods to real estate developers at international fairs (Vivant, 2022).

Research has critically examined this apparent lack of coherence. However, rather than viewing these contradictions as mere inconsistencies, this contribution explores how actors themselves make sense of these tensions and how they act in practice. This perspective provides a better understanding of how hybrid forms of temporary urbanism balance different conflicting normative prescriptions active in this field today.

To investigate these contradictions, the paper explores the operations of temporary urbanism through two analytical shifts from current perspectives. First, it examines intermediaries beyond the reduction of these actors to a specific sector of intervention (e.g. third sector, non-profit). It focuses instead on their actions and their relation to public problems, through the concept of civic action, intended as flexibly organized, collective,

social problem solving, in which participants coordinate action to improve some condition seen as socially relevant (Lichterman and Eliasoph, 2014). This approach traces both civic and noncivic actions, such as compliance with government-mandated procedures or revenue-driven activities

Secondly, it considers the role of culture in shaping these actions. While research on these practices has often considered them as technical and neutral, I assume –following the civic action perspective –that these actions are shaped by socially and culturally embedded scene styles, which are recurrent patterns of interaction that arise from members' shared assumptions about what constitutes good or adequate participation in the group setting (Lichterman & Eliasoph 2014). By tracing the appropriate ways to act and balance these prescriptions, the contribution highlights how different cultural elements shape these projects, their solutions, and their outcomes.

The contribution, based on six months of ethnographic fieldwork in a Parisian temporary urbanism project managed by two intermediaries outlines the main scene styles adopted in this project and their relation to different dilemmas faced by actors. It also traces the different forms of hybridization in action, particularly in relation to the market and public administrations.

Building on these cultural analyses, this contribution illustrates how cultural elements shape the balance between civic and noncivic actions among temporary urbanism intermediaries in France, guiding their projects toward specific strategies, solutions, and relationships.

The Forgotten Refugees: Reframing Urbanization and Governance in Shagarab Camps, Eastern Sudan

Author: Hiba Karam^{None}

Corresponding Author: karam@verkehr.tu-darmstadt.de

Refugee camps are established to provide humanitarian assistance to displaced populations (UNHCRa, 2022) and originally are intended as temporary spaces until durable solutions—repatriation, local integration, or resettlement—are achieved (UNHCRb, 2022). However, over time, many transform into protracted settlements,

undergoing significant changes (Turner, 2015). The complex realities of prolonged displacement and settlement are often overlooked, as governance frameworks and planning approaches remain rooted in their original temporary designation (Agier, 2002; Jansen, 2018). Increasingly, scholars argue that such protracted camps develop urban-like characteristics, emphasizing the need to reframe refugee camps as dynamic urban spaces that require innovative and adaptive governance strategies (Dalal, 2015; Dalal, 2022; Oyler, 2024).

Within this context, this research investigates the potential for refugee camps to evolve into urban spaces and examines governance strategies, using the Shagarab camps in Eastern Sudan as a case study. Established in 1984, the camps hosted over 60,000 refugees—primarily from Eritrea—by 2022, with numbers increasing to nearly 75,000 by 2024 (UNHCR, 2022; 2024). Despite their long history, academic research on the development and governance of these camps remains limited. This study addresses this gap by analyzing their transformation and governance dynamics.

To address the research aim, I first developed a conceptual framework based on existing studies on camp urbanization, incorporating the concepts of the “Virtual City,” “Camp City,” and “Accidental City” (Montclos & Kagwanja, 2000; Agier, 2002; Jansen, 2018). This framework examines the social, spatial, and economic transformations within the camp. Second, I analyzed the stakeholders and influencers involved in camp governance to evaluate whether existing governance frameworks effectively manage the camps.

Employing a qualitative case study approach, I conducted semi-structured interviews with 21 government officials, NGO workers, and refugee workers, along with structured interviews with 20 households. These interviews were further supplemented by participant observation, offering deeper insights into daily life, governance practices, and camp dynamics. Data collection occurred during two visits in June 2022.

The findings reveal that the Shagarab camps exhibit clear signs of urbanization. Refugees have formed enduring communities that surpass the population size of nearby towns and meet national urban agglomeration criteria. Temporary emergency tents have been replaced with durable shelters, vibrant marketplaces serve as trading hubs for surrounding areas, and refugees have diversified their livelihoods. Despite limited infrastructure, the camps demonstrate a level of development that compares favorably with their neighboring regions. This research, therefore, conceptualizes refugees as active agents of change and resilience, driven by their adaptability and determination to thrive, rather than as passive victims of displacement.

While the Shagarab camps exhibit clear signs of urbanization, their governance remains rooted in temporary frameworks. At the national level, refugees face restrictive policies, including mandatory camp residence, which undermine their potential for self-reliance. In 2019, Sudan pledged at the Global Refugee Forum to integrate refugees into national systems and promote self-reliance, but economic and political instability in the country continue to hinder implementation.

Similarly, despite UNHCR’s Development Assistance for Refugees (DAR) (UNHCR, 2005) initiative, which promotes development-based approaches, decisions by the Sudanese representative (COR9) and UNHCR remain temporary. Services are planned under the assumption of eventual camp closure or refugee repatriation, limiting investment in permanent infrastructure and long-term solutions for self-reliance.

This study critiques the “permanent temporary” state of refugees, where their contributions to urbanization—economic, social, and spatial—are unsupported by governance structures that enable integration. It emphasizes the urgent need for governance frameworks and policies to shift from temporary humanitarian responses to development-focused approaches that address the realities of prolonged displacement and meet refugees’ long-term needs.

Innercity redevelopment - processes, instruments and stakeholders in German cities (insights from the research accompanying the federal program)

Author: Alexandra Hessmann¹

Co-author: Silke Weidner ¹

¹ *BTU Cottbus-Senftenberg*

Corresponding Authors: weidner@b-tu.de, alexandracarolin.hessmann@b-tu.de

The federal program “Sustainable inner cities and centers” supports measures in 218 municipalities across Germany in large cities, medium-sized and small towns and rural communities. The aim of the program is to support cities and municipalities in overcoming acute and structural problems (“desertification”) in city centers, town centers and district centers by (further) developing them into multifunctional, resilient and cooperative places as places of identification for the municipality. The range of topics that the municipalities focus on with their projects is accordingly very diverse. It ranges from work, housing, education, leisure and social issues to urban development, open spaces and green areas, and digitalization. In addition, many municipalities are involved in strategy development, participation formats and cooperation in the form of establishing and strengthening (new) stakeholder constellations. The presentation presents selected findings from the research accompanying the federal program. The developments between the initial situation and the end of funding (approx. 4 years), success factors, obstacles and special features can be presented from the database, which records and evaluates indicators, the exchange at the network meetings with the municipalities and the visits to the municipalities with interviews with the key players.

Two overarching themes emerge: A central key to strengthening city centers and town centers lies in a balanced mix and diversity of uses. It has been shown that particularly diverse centers with an attractive mix of consumer-oriented and non-consumer-oriented locations react to structural change in a crisis-proof and resilient manner. Accordingly, city centers and town centers are now being used by many local authorities as test areas and real laboratories to counteract a possible one-sided usage structure, increase the quality of stay and length of stay and spread the sense of responsibility across many shoulders. Against this backdrop, “third places” and the cultural and creative industries are becoming increasingly important as drivers of (inner) urban development. What almost all activities have in common is that they want to generate added value from the diversity of uses, which benefits all stakeholders and ensures a vibrant city center or a lively center with a high quality of stay for the citizens. Those responsible have realized that inner city development is a joint task and that a new building and planning culture

is needed to implement the numerous ideas and achieve the objectives: involving all stakeholders, the already established inner city players as well as new groups that have rarely been represented in inner city development to date. Volunteers, multipliers and advocates as well as steering instruments such as city center management were key players in this process.

From an urban planning and open space perspective, the highly sealed inner cities also need to become green, healthy and climate-resilient against the backdrop of climate change, demographic change and the mobility transition - this is being tackled in the municipalities.

Keywords:

inner-city centres; multifunctional; resilient; stakeholder, cooperation

Can super citizens save the city? On the use of civic energies in planning.

Authors: Francesca Bragaglia¹; Gavin Parker²

¹ *Politecnico di Torino*

² *University of Reading*

Corresponding Authors: francesca.bragaglia@polito.it, g.parker@henley.reading.ac.uk

Several European countries are progressively redefining the terms of the social pact with their citizens and reconfiguring governance arrangements according to the idea of a smaller welfare state and more self-responsible citizens, some of whom themselves claim a more active role. These two-way pushes can be mutually reinforcing and have led to new opportunities and spaces for collaborative governance as well as possible exploitation. Although the idea of the active citizen is not new, we are facing a further elaboration, where citizens are ostensibly in charge of implementing spatial transformation plans, taking care of spaces, social infrastructure and services in the city through devolutionary policy, common goods regulations and as last resort. In other words, they are actively co-producing and co-managing the city. This paper, therefore, discusses the emergence of what we define as 'super-citizens' in governance and spatial planning as an effect of institutional frameworks that increasingly emphasise active participation and responsibility in communities to shape and take care of their locality. In this context, the idea of a hierarchical relationship between citizens and governments is being supplanted by several parallel spaces in which power is discussed and negotiated (Newman, 2005; Williams et al., 2014).

The rise of the 'super-citizen' as an expert citizen endowed with local knowledge and the ability to bridge political authority and civil society. The paper discusses the implications of restructuring the welfare state on public-private responsibilities (Bragaglia, 2021) and - drawing on theories of collaborative urban governance in the field of urban studies and empirical cases in the English, French and Italian contexts - highlights the dual nature of these transformations. On the one hand, they enable citizens to co-create policies and solutions in collaboration with state actors. On the other, they often impose new demands for self-management and adaptability, aligning with overarching pressures for efficiency and responsiveness. The 'super-citizen' embodies this duality, acting both as an agent of community development and as a potential negotiator of institutional frameworks. While the rise of the super-citizen represents an important opportunity to continue experimenting with shared solutions of collaborative governance, it also raises several questions and implications. This concerns, for example, the ethics of voluntarism in planning (Parker et al., 2020), the representativeness of these subjects of the visions of the city of which they are bearers, as well as the fact that their acquired professionalism

and their collaborative approach with institutions. These factors distinguish them from the antagonism that characterised the political identity of social movements (Castells, 1997) and, thus, the risk that potential dissent is made less and less visible through this new figure of the super-citizen. If the super-citizen is increasingly seen as a necessary or effective partner for institutions in the day-to-day management of and in the development of cities, it is necessary to critically interrogate these new forms of collaboration.

People's Plans: Partnering with communities to take action and influence planning

Author: Pablo Sendra¹

¹ UCL

Corresponding Author: pablo.sendra@ucl.ac.uk

London has been going through a population growth since the 1980s. This population growth has been paired with a neoliberal planning approach, in which city-making relies heavily on private-sector developers, and in which public authorities follow a private development logic. Since the beginning of the 21st century, local authorities have viewed social housing estates as places for redevelopment and densification. They have seen in estate regeneration an opportunity to address London's housing crisis and deliver housing numbers that meet their targets. This concentration on number of homes results in disregarding the relevance of social infrastructure (spaces where people can gather), which is typically reduced or not extended in such densification schemes, resulting in less social infrastructure per resident. In addition to this, most of these schemes do not result in an increase of social rent units, but in a decrease of social housing units at expense of private market homes.

Social housing regeneration in London has been heavily contested by residents, housing campaigners, as well as scholars. Since the 2010s, there was an increase in community groups campaigning against the demolition of their homes and demanding other approaches to regeneration, which have managed to have some influence on regeneration schemes and on London-wide policies on estate regeneration. Between 2016 and 2019, Daniel Fitzpatrick and I conducted a research project that explored how community

groups were engaging with different planning tools and using a diversity of campaigning strategies for opposing the demolition of their homes and proposing community-led regeneration schemes. This piece of research led to the publication of the book *Community-Led Regeneration: A Toolkit of Residents and Planners* (Sendra and Fitzpatrick, 2020). One of the strategies that many groups used was collaborating with architects to draft a “People’s Plan” or “Community Plan”. A People’s Plan is not a statutory planning document, but a community vision that residents put together with the aim of influencing or leading decisions on the future of their neighbourhood.

Since 2019, I have worked in collaboration with various community groups facing top-down regeneration schemes on co-producing a People’s Plan for their neighbourhood. Through funded research and knowledge exchange projects, I have used a participatory action research approach and co-design methods to co-produce community-led schemes with residents living in social housing, as well as supporting evidence for these plans in relation to their social and environmental impact, and their financial viability. Residents have used the outputs of this projects to present it to local authorities and stakeholders to influence planning decisions.

This paper presents four London-based case studies of participatory action research projects carried out in partnership with community groups living on social housing that were facing the demolition of their homes, other type of top-down developments, and/or the loss of social infrastructure. These case studies are South Kilburn Estate, Alton Estate, Trellick Tower and Edenhall Way, and Barking Riverside. The paper first introduces each of the case studies and, based on the results of the project, it reflects on the value, ethics, methods and impact of working with communities. This includes how to build partnerships with community groups, how to define the purpose of the collaboration, how to plan to the project to maximise impact in relation to the context, the impact that each of the project has had, the different types of knowledge it has generated, and how each of these experiences can learn from each other.

Redefinition of Urban-Rural Boundaries Under Centralized Governance: Urban Environmental Movements in The Case of a Coastal Town, Ayvalık, Turkey

Author: Bilgesu Sever¹

¹ *Bilkent University, Department of Architecture*

Corresponding Author: bilgesu.sever@bilkent.edu.tr

This paper examines the evolving relationship between urban and rural territories under Turkey’s centralized governance model, focusing specifically on the case of Ayvalık and the implications of the 2012 Metropolitan Law (Law No. 6360). This legislation, which extended the jurisdiction of metropolitan municipalities to encompass rural areas, has significantly altered the socio-spatial dynamics of urban governance. By conceptualizing Ayvalık as a metropolitan hinterland, the study explores how central government’s administrative system redefines territorial boundaries, triggering urban expansion beyond

ecological thresholds through social confrontations and spatial-environmental transformations (Apostolopoulou, 2023; Arboleda, 2016; Acara & Penpecioglu, 2022).

The research highlights the role of urban environmental movements in these processes as key actors in participatory planning and governance, providing critical resistance to and engagement with the urbanization agenda. By situating Ayvalık within the broader framework of urban political ecology and planetary urbanization (Brenner & Schmid, 2014), the study seeks to uncover the socio-ecological and political consequences of integrating rural territories into urban governance systems and thus, intends to unravel the role of planning in an age of planetary crisis (Harrison & Heley, 2015).

In 2012, Turkey implemented the Metropolitan Law, which transformed the administrative and governance landscape of the country. By incorporating rural areas into metropolitan boundaries, it effectively erased the legal distinction between urban and rural territories. This restructuring has had profound implications, including changes to land use, resource allocation, and the socio-political fabric of rural communities. Expanding metropolitan boundaries has intensified socio-ecological conflicts, particularly in areas like Ayvalık, where environmental movements contest top-down governance. Known for its ecological and cultural heritage, Ayvalık was found to be an ideal case for studying centralized governance's impacts on urban-rural boundaries.

Key research questions include:

- How has the 2012 Metropolitan Law redefined the territorial boundaries between urban and rural in Ayvalık regarding socio-political dimensions?
- In what ways do urban environmental movements confront and influence the centralized governance model?
- What are the socio-ecological consequences of this integration for local communities and landscapes?

This study is grounded in the theoretical perspectives of urban political ecology and planetary urbanization, which challenge traditional dichotomies between urban-rural by emphasizing their interconnectedness. These frameworks provide a lens for analyzing the socio-ecological networks that shape and are shaped by centralized governance practices (Taylor & Derudder, 2015). Methodologically, the research adopts a qualitative approach, employing ethnographic methods such as participant observation and in-depth interviews with key stakeholders, including local and metropolitan activists. Additionally, cartographic tools are used to visualize the spatial transformations resulting from the changes in legislation and the activities of resistance.

Preliminary research indicates that Ayvalık's incorporation into metropolitan governance has led to significant shifts in land use patterns, with increased urbanization encroaching on ecologically sensitive areas. Urban environmental movements in the region have emerged as critical actors in resisting these changes, advocating for the preservation of natural and cultural heritage through participatory and inclusive approaches. These movements highlight the socio-political tensions between centralized governance and local autonomy, revealing new dimensions of urban-rural dynamics.

The study serves to contribute to ongoing debates on centralized governance and urbanization by offering a nuanced understanding of how urban-rural boundaries are redefined in contemporary Turkey. By focusing on Ayvalık, it provides empirical insights into the socio-ecological and political dimensions of this process, emphasizing the transformative potential of social movements. The findings aim to inform both academic discussions and policy-making, advocating for more inclusive and sustainable urban governance models that respect local specificities and ecological constraints.

Neo-Exogenous Development: China's Integrated Territorial Development Approach against Rural Marginalization

Author: Shengxi Xin¹

¹ *Tongji University*

Corresponding Author: xinshengxi@outlook.com

Since the 1950s, China's rural areas have provided abundant cheap land, labour, and agricultural products to fuel urbanization and industrialization. To sustain this role, the state established institutional arrangements that marginalized rural areas in administrative, fiscal, and land development rights, alongside an unequal welfare distribution structure between urban and rural residents (Verdini and Xin, 2024). To ensure this extractive system functioned across China's vast territory, the government adopted a semi-formal governance model rooted in practices from the imperial era. Contemporary governance relies on "Janus-faced" village cadres who act as both community leaders and party-state agents, enabling flexible yet authoritative implementation of state directives tailored to local rural contexts (Xin and Gallent, 2024).

Over the past two decades, significant rural restructuring has occurred as the central government prioritized narrowing urban-rural disparities and improving access to basic services in rural areas (Shen, 2020). These efforts have increased the economic connectivity between urban and rural regions, while also diversifying the socio-spatial structures of rural areas. However, these changes have weakened the state-backed village cadre-centred governance structure. Emerging local forces, such as clans, gangsters, and entrepreneurs, have played increasingly prominent roles in rural governance, further eroding the authority of the central government. At the same time, the institutional structures underpinning urban-rural disparities remain largely unaltered.

In 2012, the new government introduced the National Rural Revitalization Strategy, marking the first time rural areas were positioned on equal footing with urban areas in national development priorities. This strategy is projected to allocate approximately 1 trillion USD to promote socio-economic development and improve living environments in rural regions (Xin and Deng, 2025). Similar to the EU's Integrated Territorial Development approach, rural revitalization emphasizes cross-sectoral collaboration (e.g., encouraging community participation), multi-level governance (e.g., requiring

contributions from all levels of government), and place-based strategies (e.g., exploring mechanisms to ensure rural households benefit from development gains). Some scholars have thus interpreted this as a neo-endogenous development model, a community-driven networked development approach.

However, unlike neo-endogenous development, which emerged in the context of neoliberal state withdrawal, I argue that China's rural revitalization represents a state-led networked development model with steered endogenous features, which I term Neo-Exogenous Development. A defining characteristic of this model is the top-down penetration of state power into rural communities through political mobilization. This approach serves two purposes: restoring the central government's grassroots authority and addressing structural rural marginalization.

This study critically examines the complex policy framework underpinning rural revitalization, including its associated laws, regulations, and initiatives, to theorize Neo-Exogenous Development. Through a qualitative case study of a village in Sichuan Province, an inland region in western China, this research explores the dynamics of the Neo-Exogenous model in practice. Findings reveal that state-driven measures targeting both government structures and rural society include: nationwide multi-scalar political mobilization, legislative and regulatory restructuring, zoning/rescaling, project-based financial expansion, community-based party-building, and urban-rural connecting initiatives.

These interventions, particularly those aimed at government institutions, have adjusted urban-industry-biased local development agendas. They have enhanced the administrative and fiscal authority of local rural governments and expanded villages' rights to land development. The state also plays a critical role in addressing market failures by channelling market resources into rural areas, fostering collaborations between enterprises and villages, and ensuring mechanisms for farmers to share in development benefits.

Nevertheless, despite its strengths, the Rural Revitalization Strategy serves a dual purpose of socio-economic development and reinforcing state's grassroots authority. This dual intent leads to an ambiguous stance on removing institutional barriers that restrict rural endogenous development. Consequently, many rural revitalizations practices risk being reduced to the construction of showcase villages, undermining the broader transformative potential of the strategy.

From Intentions to Outcomes: Meaningful Collaboration in Participatory Processes for Sustainable Transitions

Author: Selina Abraham¹

¹ *University of Amsterdam*

Corresponding Author: s.abraham@uva.nl

This paper explores arising tensions and contradictions in participatory planning against the backdrop of strategic spatial planning and other overlapping nested planning paradigms (Albrechts, 2013). This is significant as the field of planning has shifted from traditional land-use planning to area-based, actor-driven and process-oriented planning (Albrechts, 2013). The aforementioned tensions are explored through the term “meaningfulness”, a sensitizing concept that is frequently used in planning practice and literature to capture an unmet desire felt by actors in participatory processes. It builds on the argument that these processes can be meaningful (Yeoman, 2019) when they offer opportunities for worthwhile activities that allow citizens to contribute to their living environment through care, stewardship, maintenance and repair. However, the absence of meaningfulness can lead to citizens feeling alienated from their living environment, other actors and the processes that sustain its development. This, understandably, impacts the perceived legitimacy of urban governance, subsequently influencing sustainable transitions in cities.

The research builds on this concept of meaningfulness based on action research conducted by the author in a deliberative participatory process for the proposed transformation of a former industrial district in a major Dutch city. The research included municipal data from an instrumental participatory process, municipal policy documents and ethnographic data. The author, as a researcher and contributing member of the process, followed the interactions between a citizen delegation, a municipal project team, and a facilitator, all with the collective goal of exploring the ambitions of a municipal structural framework plan for the district. The citizen delegation aimed to present a collective value map, developed alongside other stakeholders, to encapsulate the ‘soul’ of the existing lived environment, which they felt was inadequately represented in the municipal framework plan.

The study of these interactions offers grounded insights into how actors experience meaningfulness, or the lack thereof, while participating in collaborative processes urban transition projects. To operationalise “meaningful” outcomes, the intentions of actors or commitments to action (Bratman, 1987), are used to study their motivation to seek or invite collaboration over their living environment, and how their actions evolve through collaboration with others. These intentions are studied through the concept of “pragmatic registers” (Stapper and Duyvendak, 2020) which have been adapted in this research from their original conceptualisation in the literature as a tool for sociological critique to a novel methodological tool for transformative social innovation (Avelino et al., 2019) in participatory processes. The research maps three pragmatic registers to illustrate how intentions transform in participatory processes to draw new lessons for meaningful collaboration in participatory planning for urban transitions. The lessons are, a) embracing uncertainty in urban transition projects – scenarios as opposed to normative “frameworks”, b) creating novel institutional arrangements that give local stakeholders opportunities to impact socio-spatial context like facilitating community-benefit agreements, and c) using multi-value creation as a guiding objective as opposed to participative or deliberative democracy.

Involving Youth in Urban Governance: Project on the “Participatory Skills for Sustainable Urban Governance

Authors: Nadia Charalambous¹; Christina Panayi¹; Michalis Psaras¹; Christine Mady²; Tihomir Viderman³

¹ *University of Cyprus*

² *Aalto University School of Arts, Design and Architecture*

³ *Brandenburg University of Technology*

Corresponding Authors: panayichrist@gmail.com, christine.mady@aalto.fi, psaras.michalis@ucy.ac.cy, viderman@b-tu.de, charalambous.nadia@ucy.ac.cy

Often formalized, if not ossified, governance structures frequently disregard engaging diverse voices and open the arena to alternative means of addressing local(ized) challenges. The inclusion of youth—often overlooked in decision-making—promises to bring fresh perspectives to shaping pathways towards more equitable and sustainable urban futures. However, youth participation faces significant systemic barriers, including limited access to platforms for civic engagement, inadequate decision-making frameworks, insufficient recognition of youth organizations, mistrust between generations and often fragmentation of youth initiatives, all of which hinder meaningful engagement in urban planning and decision-making processes. The Participatory Skills for Sustainable Urban Governance (PS-U-GO –psugo.eu) project introduces Urban Living Labs (ULLs) as open and accessible platforms to address these gaps, fostering youth participation in urban governance based on inclusive co-creation, knowledge exchange, and problem-solving in response to global and local urban challenges.

Problem Addressed:

Drawing on co-governance models, which bring together actors from academia, government, industry, and civil society, ULLs offer a dynamic framework for diverse stakeholder engagement in decision-making that balances local needs with global challenges while ensuring, while addressing challenges such as power imbalances, conflicting priorities, and bureaucratic inertia. PS-U-GO furthers ULL methodology by facilitating youth engagement. Implemented in four distinct urban contexts—Naples, Nicosia, Palermo, and Cottbus—the project addresses issues such as social exclusion, resource inequities, and insufficient mechanisms for democratic participation. Through ULLs, PS-U-GO empowers youth to shape urban transformation processes, fostering their sense of agency in enacting meaningful change.

Methodology:

PS-U-Go's methodology is structured across three phases: Design and Initiation, Operation, and Evaluation and Feedback. The Operation phase is pivotal for entailing “learn-make-show” and includes:

- Theme Choice: Identifying needs and opportunities, with a focus on youth, to select relevant themes or topics.
- Exploration: Lab sessions, on-site explorations, and urban masterclasses with external experts to acquire new knowledge and co-develop ideas for positive urban action.
- Experimentation and Co-Creation: Co-creating, testing, and prototyping (if needed) with support from external experts to achieve the desired outcomes.
- Urban Showcase: Sharing the process and outcomes with the public to communicate the new knowledge creatively and effectively.

Tools such as GIS mapping, co-design workshops, participatory storytelling, participatory action research and creative actions like gamification are employed to ensure inclusive and meaningful participation and allow for contextual adaptation. A hybrid approach—blending digital and analog tools—addresses accessibility challenges while fostering dialogue and collaboration. Iterative feedback mechanisms and evaluation tools, such as NVivo and Tableau, offer actionable insights enhancing stakeholder engagement and project outcomes, fostering reflective learning and creating continuous feedback loops. The methodology adapts to local contexts, integrating stakeholders from the quadruple helix—academia, industry, government, and civil society—to promote cross-sectoral collaboration.

Outcomes:

While co-governance models foster collaboration and innovation, they are not immune to challenges such as power imbalances and insufficient recognition. PS-U-GO illustrates how equipping young people with the skills and opportunities to influence urban decision-making can offset these challenges. The project's four ULLs adopt a flexible and adaptable methodology and act as four different cases of youth-inclusive urban governance models/ cases. Working in parallel, from December 2024 to October 2025, these ULLs foster knowledge exchange through training events, with a well-organized schedule and key shared points of exchange. PS-U-GO offers a replicable framework for promoting equitable, sustainable, and resilient urban development globally, showcasing the importance of youth inclusion in overcoming future local and systemic challenges.

Beyond ordinary boundaries. Dealing with housing rights to address spatial inequalities

Authors: Giorgia Arillotta¹; Gilda Berruti¹

¹ *Università Federico II di Napoli, DiARC*

Corresponding Authors: giorgia.arillotta@unina.it, gberruti@unina.it

The City of Naples is facing the complex challenge of dealing with the consequences of a persistent housing crisis. The reconfiguration of public housing settlements, often

marked by serious conditions of blight and poverty, represents a structural problem for the city, a long-term emergency to be governed, recently carried out in the framework of National Recovery and Resilience Plan (NRRP), that is part of the Next Generation EU Programme.

The ongoing regeneration of the “Taverna del Ferro” housing estate in East Naples, known as the Bronx, marks the beginning of a significant urban transformation in a neighbourhood historically burdened by social and urban decay. The blue fences surrounding the working site can be read as a symbol of the ongoing change.

Environmental and energy transitions are key components of the NRPP project, while citizens’ involvement is a priority in the administration’s political agenda.

The town council is striving to develop innovative regulatory approaches, particularly by creating new forms of social agreements that ensure the active participation of local communities in the ongoing transformations. These transformations highlight the need to develop sustainable transformation models capable of triggering public policies that respond to the economic and social needs of the neighbourhood. The objective is to ensure a regeneration process that is not only lasting, but also capable of stimulating new local economies and triggering employment opportunities.

This contribution starts from the results of a mapping activity carried out in collaboration with the “Ex Taverna del Ferro” fight committee and local inhabitants. Just before the opening of the construction site, the primary objective of the survey was to capture an overview of the formal and informal uses of the ground-floor spaces in the Taverna del Ferro residential buildings and the surrounding garages. The mapping was complemented by interviews with key local witnesses from the community and associations.

The case study prompts multiple reflections:

- on local responses to policy inputs coming from EU programmes;
- on institutional challenges to propose new regulatory approaches or changes in current regulations;
- on the role of collaborative mapping and interviews as tools for involving residents in the housing estate regeneration.

The paper explores how expectations and perceptions emerging from the collaborative mapping can be translated into effective project strategies. It highlights the importance of integrating issues such as valorising the informal local economy, improving the quality of public spaces, and preserving the cultural identity of the neighbourhood into regeneration plans. This integration is essential to ensure that transformation does not lead to displacement or social exclusion. In this context, the relational capabilities between the actors involved - administrations, planners and inhabitants - play a central role through participatory governance tools.

Such an approach results in consolidating mutual trust among actors, thus promoting an ‘open’ transformation process where mutual learning is addressed overcoming ordinary boundaries. It also works as a lens for analysing the relationships between stakeholders, uncovering inequalities and power relationships, thus treating potential conflicts during the transformation process.

PARTICIPATION AFTER DISASTER: CENTRAL GOVERNMENT APPROACH TO PARTICIPATION PLANNING

Author: Beyza Kurt¹

¹ Master's student, ITU Faculty of Architecture, Urban Planning Master's Program

Corresponding Author: kurtb24@itu.edu.tr

In the light of social movements that started in the 1960s, individuals began to demand equality and democratic processes. With discussions on the individual's relationship with the city, participation was included in urban studies, especially in the second half of the 20th century. As the 21st century came, it is passing as an age of crises because of consecutive crises ranging from increasing climate change and environmental degradation to social and economic inequalities. While the world struggles with the crises caused by the irreversible impact of humanity on the environment, there is also a vulnerable segment of the world caused by socioeconomic inequality. Existing management systems are expected to overcome the crisis by intervening with short-term policies in the face of crises. However, the crisis experienced because of cities with complex social, economic, spatial, and environmental relations causes other crises (Şengül, 2023). To understand these complex relations and the vulnerable part of society, participation in the management system should be increased and the area of negotiation and dialogue should be kept wide. Therefore, in recent years, many studies such as the Sendai Framework have been conducted to institutionalize participation in disaster management. The focus of this study is to examine the participation perspective in the recovery process of Turkey after February 6, 2023, Kahramanmaraş earthquakes from the institutionalized participation understanding in the world. In the light of the literature on participation, the participation perspectives of various stakeholders in the post-earthquake recovery process are evaluated. From the literature, evaluation criteria for involvement have been identified to ensure success in democratic governance. The stakeholder participation plan in the Earthquake Recovery and Reconstruction in Rural Areas Project (KADİYAP), implemented by the Ministry of Environment, Urbanization, and Climate Change with financing from the World Bank, was reviewed, and the central government's approach to managing the participation process was evaluated. The evaluation criteria from the literature were assessed based on the participation methods used by the central government, feedback from stakeholders, and information published in the report about the stakeholders participating in the plan. The process was evaluated based on the three participation principles of justice and power sharing, transparency and accountability, and inclusiveness. Inclusiveness issues such as the few women participants in some meetings were observed. Problems such as the absence of a staff member from a state institution who would be the addressee of most of the stakeholders' questions indicate that the project is limited to providing one-sided information. This participatory plan of the central administration consists of providing information only with a top-down approach. The lack of mutual dialogue with society, local institutions, and civil society organizations prevents power sharing between institutions. Finally, the fact that the complaint mechanisms developed for a more transparent process are directly under the central administration cannot be a successful application as it turns into a system where the government controls the citizens. Finally, for this plan to be interactive and participatory, it needs to create areas where stakeholders can negotiate among themselves, and it is expected to be a flexible and transformative process for the upcoming process.

Multilevel Governance for Urban Water Resilience, the case of the Water as Leverage (WaL) Programme

Author: Corinne Vitale¹

Co-author: Sander Meijerink¹

¹ *Radboud University*

Corresponding Authors: corinne.vitale@ru.nl, sander.meijerink@ru.nl

Enhancing urban water resilience is a key challenge for climate change adaptation. Cities worldwide are implementing strategies to address increasing threats such as flooding, drought, and water scarcity. These efforts depend on local community engagement, alignment with national policies, and financial support from international donors. At the same time, national governments and donors rely on cities for the implementation of these strategies. These interdependencies, fundamental to polycentric governance, require effective coordination among governmental and non-governmental actors. Coordination in multilevel governance balances top-down, state-centric approaches with bottom-up, governance-focused models. While top-down approaches emphasize hierarchy, bottom-up approaches highlight local, networked solutions. Striking a balance between input legitimacy (participation) and output legitimacy (effectiveness) is essential. Bottom-up models promote innovation and scalability, which are key for addressing complex environmental issues like urban water resilience. Furthermore, the institutional settings and structures within which multilevel governance processes operate are crucial, as they shape the interactions and decision-making processes across different levels of government and stakeholders, influencing the overall effectiveness of resilience strategies.

Building on Dieperink et al. (2018), who identified six key mechanisms for multilevel governance coordination—(1) policy entrepreneurship, (2) bridging concepts, (3) clarity about rules, (4) financial resources/funding, (5) governmental hierarchy, and (6) coordinating bodies—this paper first develops a typology of actionable strategies that stakeholders in urban water resilience initiatives can apply to improve coordination across government levels. Secondly, the use of such strategies in the Water as Leverage (WaL) programme is discussed. Launched in 2017 by Henk Ovink, then the Special Envoy for Water Affairs of the Netherlands –and drawing inspiration from the Rebuild by Design competition developed in response to Hurricane Sandy’s devastating impact on the U.S. Eastern coast, Water as Leverage (WaL) tackles water and climate challenges with innovative and inclusive solutions. The first *WaL programme for Resilient Cities Asia* has expanded globally with initiatives in Cartagena (Colombia), the Wadden Sea (Denmark, Germany, Netherlands), Nakuru (Kenya), and ongoing projects in India, Indonesia, and Thailand. This paper zooms in on the WaL projects in Cartagena and Chennai. It is shown that WaL developed strategies to bridge the gap between local users and donor agencies, and secure funding throughout the project cycle. WaL advocates early procurement strategies, pilot projects, and workshops to manage financial risks. As an example, in Cartagena, the WaL team engaged funding agencies from the outset. Representatives from Invest International were included in the Advisory Board to ensure that projects met investment criteria. By aligning local projects with funding agency requirements from the start, the WaL team secured funding and support. This early collaboration facilitated the design of projects that met financial and policy criteria, fostering collaboration through local design and policy-finance workshops. In Chennai, water challenges were addressed through pilot projects using Nature-Based Solutions (NBS), moving beyond traditional siloed approaches. Collaboration between local actors and international experts fostered shared understanding, cross-scale connections, and innovation. These pilots provided proof of concept and insights, catalysing upscaling efforts, sustaining the WaL movement’s momentum, and inspiring further achievements.

While the WaL programme has contributed to advancing multilevel governance for urban water resilience, findings indicate that the process is ongoing and complex. Enhancing multilevel governance is a challenging and iterative process. However, the coordination mechanisms and strategies outlined in this paper can serve as a resource for stakeholders involved in urban water resilience initiatives, offering inspiration and practical guidance for improving multilevel coordination.

T_04 GOVERNANCE (B) / 895**Towards Integrated Water Governance in Indonesia: Harmonizing Local and Transboundary Solutions****Author:** Retno Sari Dewi¹**Co-authors:** Mega Anggraeni²; Wiwandari Handayani¹¹ *Department of Urban and Regional Planning, Universitas Diponegoro*² *Center for Urban and Regional Resilience Research (CURE)***Corresponding Authors:** wiwandari.handayani@pwk.undip.ac.id, retno.sari.dewi@pwk.undip.ac.id, mega.anggraeni12@gmail.com

Water plays a crucial role in sustaining life, maintaining ecosystems, and facilitating economic progress. Nevertheless, its management presents complex challenges in the face of growing demands and environmental changes. Effective water governance is essential for enhancing resilience and ensuring the sustainable management of water resources. The mismanagement or overexploitation leads to the depletion of essential freshwater supplies, thereby leaving communities and ecosystems vulnerable to shortages. Furthermore, excessive extraction and improper waste disposal potentially degrade water quality, harm aquatic habitats, and disrupt the natural equilibrium of ecosystems. Coastal cities face particularly complex water management challenges due to the confluence of climate change impacts, rapid urbanization, and significant land subsidence. For example, Indonesian coastal cities such as Jakarta, Pekalongan, Semarang, and Demak confront an array of escalating water-related problems, including persistent flooding, water shortages, deteriorating infrastructure, and socio-economic disruptions. According to the data from National Disaster Management Agency, floods become the most frequent disaster in 2024. However, water management initiatives are often compromised by fragmented governance structures and constrained authority at various administrative levels, leading to inefficiencies and overlaps in roles and responsibilities. The complexity of governance is further exacerbated by transboundary dynamics. A case in point is the flooding experienced in Semarang City, which is partially attributed to the Garang River's flow originating in the upstream regions of Semarang Regency. Consequently, mitigating flood-related issues in Semarang City requires collaborative efforts with stakeholders from Semarang Regency. As water disregards administrative boundaries, managerial decisions transcend administrative borders, introducing additional layers of intricacy to the existing challenges.

Addressing these multifaceted challenges requires transformative approaches to water governance that integrate technical, social, and financial dimensions. This research examines the dynamics of water governance in Indonesia, focusing on the roles and interplay of various stakeholders across different hierarchical levels. Employing a qualitative approach, the research incorporates policy reviews and in-depth interviews with representatives from governmental bodies, private enterprises, community-based organizations, and academic institutions. The study identifies critical gaps in governance, including overlapping responsibilities, insufficient coordination between vertical (national to local) and horizontal (cross-sectoral) stakeholders, over-reliance on external actors, and financing mechanism. These systemic issues constrain the ability of local governments and stakeholders to implement integrated and sustainable water management practices effectively.

The findings reveal a highly complex network of stakeholders with overlapping mandates and competing priorities, often resulting in fragmented urban water governance. While national and regional governments play central roles in policy formulation and resource allocation, local governments and community groups frequently lack the capacity to implement integrated solutions. Additionally, at all levels, stakeholders in Indonesia tend to prioritize short-term profitability over long-term resilience. These challenges emphasize the urgent need for multi-stakeholder platforms that can foster collaboration, enhance accountability, and build adaptive capacity to address the impacts of climate

change and rapid urbanization. Lessons drawn from the Indonesia case provide valuable insights into enhancing water management systems, ensuring they are resilient, inclusive, and adaptive to the evolving needs. This research contributes to a better understanding of stakeholder dynamics in water-related urban development, offering actionable insights for fostering more equitable and sustainable governance frameworks in Indonesia's coastal cities.

Participatory Urban Planning for Sustainable Urban Regeneration: Insights from a Case Study in Korea

Author: Jiah Lee¹

¹ Korea Research Institute for Construction Policy

Corresponding Author: jiapooh91@gmail.com

Participatory urban planning has emerged as an essential approach to addressing urban decline and fostering sustainable development. This study examines South Korea's Majeon Urban Regeneration Special Program, implemented in Majeon Village, Geumsan County, as a case study to assess the effectiveness and limitations of participatory planning in the Korean context. By analyzing planning and implementation processes, this research aims to derive insights applicable to both South Korea and broader international urban planning practices.

The study employed qualitative research methods, including collaborative workshops and focus group interviews (FGIs) with key stakeholders such as local residents, municipal authorities, public institutions, urban planning experts, and a local university. The results demonstrate that participatory planning in South Korea can generate democratic and context-specific urban design proposals by employing a phased approach and clearly defined stakeholder roles. Collaboration with a local university significantly improved the feasibility and quality of design proposals, while community engagement fostered social capital and economic revitalization. However, critical challenges were identified, including weak institutional support, inconsistent citizen engagement in later phases, and insufficient implementation strategies.

To contextualize the Korean case within a global framework, this study compares the Majeon Urban Regeneration Special Program with international participatory planning models, including Germany's Integrated Urban Development Concept (ISEK), Japan's Machizukuri, and the Community-Based Planning framework in the United States. Germany's ISEK model highlights the necessity of institutionalized participatory planning, where local governments facilitate early citizen engagement while ensuring professional expertise in later stages. Japan's Machizukuri model underscores the role of sustained community cooperation, fostering long-term resident involvement through locally embedded governance structures. The U.S. Community-Based Planning framework demonstrates the benefits of tailored, bottom-up approaches that integrate local knowledge into urban design.

The comparative analysis suggests that while South Korea's participatory planning approach has demonstrated strengths in democratic decision-making and collaborative design, it requires stronger institutional backing to ensure long-term sustainability. The study recommends policy measures such as legal frameworks that mandate citizen participation from the early planning stages, localized support networks to enhance community engagement, and standardized models for university-community collaboration. Additionally, the establishment of sustainable resident councils, similar to Japan's Machizukuri, could provide a mechanism for ongoing citizen involvement beyond the initial planning phases.

This research contributes to the global urban planning discourse by emphasizing the

need for context-specific participatory planning frameworks that balance top-down institutional support with bottom-up community engagement. By strengthening the implementation mechanisms of participatory urban regeneration, South Korea can enhance the effectiveness of its urban renewal policies while offering insights applicable to other socio-cultural contexts worldwide.

Towards co-governance? Emergent norms and forms of neighbourhood governance in urban China

Author: Shenjing He¹

¹ *Department of Urban Planning and Design, The University of Hong Kong*

Corresponding Author: sjhe@hku.hk

Portraited as the ‘last mile’ and ‘basic unit’ of social governance in Chinese official discourses, the neighbourhood has recently gained unprecedented importance in Chinese cities. Active neighbourhood participation and multi-actor collaboration become the new norms of neighbourhood governance, characterised by the emergence of multiple new forms of governance led by different stakeholders. Traditional neighbourhood governance predominantly led by state actors and the semi-private governance in gated communities are widely being replaced by ‘neighbourhood co-governance’ in both discourses and practices. In the past decade, three major forms of neighbourhood co-governance have emerged: state-led co-creation, professional-led place-making, and enterprise-party co-development, which is led by the local state, societal actors, and market actors respectively. Not only the leading actors in each type of co-governance matter, but also the configuration of the governing structure, i.e., the roles of key stakeholders and their power relation, is essential to understanding the variegated forms of neighbourhood co-governance. This research aims to answer three sets of questions: What are the distinctive features and underlying mechanisms of these new norms and forms of neighbourhood governance? Do they represent a paradigm shift towards more participatory and inclusive neighbourhood governance? Can they achieve the alleged goals of neighbourhood satisfaction, cohesion, and participation?

To address these timely yet largely unexplored questions, this research employs the theoretical lens used in examining state-market-society relations in China, including the state project of crisis management (He et al., 2020), state infrastructural power (Cai and He, 2022), and state entrepreneurialism (Wu, 2018), to scrutinize the emerging norms and forms of neighbourhood governance. Case studies in Guangzhou illustrate how local governments enhance the inclusiveness and effectiveness of neighborhood governance by engaging various third-party actors, such as local enterprises, community planners and other urban professionals, and residents’ self-help groups (Zhao et al., 2024). Local governments are skillfully avoiding direct confrontation with residents by incorporating urban professionals and empowering social actors to promote co-production among multiscale participants.

The rise of neighbourhood co-governance in Chinese cities can be conceptualized as an enactment of a distinctive entrepreneurial state project that serves the purpose of crisis management through consolidating state infrastructure power, delivering governance goals, and practicing entrepreneurial governance at the neighbourhood level (He and Cai, 2024). The state-led co-creation helps strengthen the legitimacy and

power of local governments in neighbourhood governance by co-opting opinion leaders among residents, integrating resources across administrative boundaries, and seeking empowerment from higher-level governments. Neighbourhood garden-building helps local governments achieve their economic and social governance goals, by bridging governments' needs for budget saving and residents' demands for better quality of life. For enterprise-party co-development, the property management company and developers see co-governance as a good opportunity to maintain a good relationship with the local government, leverage more state investment, and sustain property prices, while the participation of residents is mainly limited to party members, elites, and retirees. This research advances our theoretical and empirical understanding of neighbourhood governance and inform urban planning in Chinese cities and beyond.

Community Renewal and Autonomous Governance Dynamics: A 30-Year Analysis of Hangzhou's Practice

Author: bin liu¹

¹ *Zhejiang University*

Corresponding Author: betterliubin@zju.edu.cn

China's urbanization is transitioning from rapid development to high-quality development, with community renewal in old urban areas being a key component. However, due to the dispersed property rights and complex interests in old communities, the difficulty of community renewal has increased. New governance models are urgently needed to alleviate the contradictions and conflicts that arise.

As a representative city in China's developed southeast coastal region, Hangzhou has been continuously renewing its urban landscape, driven by the Internet industry and major events such as the Asian Games. The renewal of its residential neighborhoods is imminent. This paper uses Zhegong Xincun as an observation window to examine the community renewal process and the development of autonomous governance in Hangzhou over the past 30 years. It explores the continuous coupling process between the two and the factors affecting autonomous community renewal, proposing adapted policy suggestions.

We propose an analytical framework of "Evolution - Coupling Process - Role Mechanism - Adaptation Strategy." First, we summarize the coupling process between Hangzhou's urban renewal from 1993 to the present and the evolution of self-governance through

text analysis and expert interviews. We then conduct an in-depth examination of multiple stakeholders, including residents of Zhegong Xincun, local and higher-level governments, design and construction units, and media, using questionnaires and semi-structured interviews. Additionally, we interview residents from other communities, such as Cuiyuan and Binfen, to reveal the mechanism of autonomous renewal from dimensions of environmental variables, acceptance criteria, participation criteria, and participants.

The study finds that: 1. Over the past 30 years, Hangzhou's community development and renewal have shifted from material renewal to organic renewal, encompassing elemental renewal, tenure renewal, and organizational renewal from a spatial governance perspective. 2. With people-oriented urbanization and the awakening of public property rights awareness, public participation in Hangzhou has evolved from non-participation to tokenistic participation to public control, currently manifesting as empowerment. 3. Factors influencing public participation are multidimensional. Environmentally, they benefit from Hangzhou's urban renewal concept, its economic environment, and real estate situation. Acceptance criteria are enhanced by the independence and transparency of the participation process and early resident involvement. Participation criteria are supported by the accessibility of resources through public platform construction, standardized decision-making, and professional, public cost-benefit calculations. Participants, being retired teachers in Zhegong Xincun, have overall economic conditions, cultural literacy, cognitive abilities, and social integration that are necessary for autonomous renewal success, giving Zhegong Xincun certain unique characteristics. 4. Essentially, autonomously-governed renewal succeeds through top-down empowerment and bottom-up governance. Future urban renewal should focus on developing standardized reception and participation criteria, including processes and consultation mechanisms.

This study provides a clearer understanding of Hangzhou's community renewal and autonomous governance evolution and their coupling process. Theoretically, it offers a new research framework revealing autonomous governance's underlying logic and influencing mechanisms. Practically, it emphasizes promoting relevant norms and standardized processes to improve the autonomous governance system and capacity. Despite the project's localization and specificity, it serves as a benchmark for demonstration.

Building institutional capacity for meaningful citizen engagement –exploring public-private-civic collaborations in Dutch urban development practice

Author: Céline Janssen¹

¹ *postdoc researcher TU Delft*

Corresponding Author: celine.janssen@tudelft.nl

As cities worldwide face growing social challenges such as socioeconomic segregation or climate injustices, engaging citizens in urban planning and development is considered increasingly important. Involving local communities not only leads to better understandings of local needs and potentially more effective plans, meaningful citizen-planner dialogues might also help to foster trust and to enhance social cohesion (Othengrafen et al, 2024). A common challenge of participatory practices, however, is that they remain situational and need to be scaled up to sustain and to make a wider impact. One

potential solution is to shape institutional conditions that support sustainable citizen engagement within broader governance structures.

While various studies reporting on institutional conditions for citizen engagement depart from public perspectives, contemporary European urban transformations often involve both public, private and civic actors. Although market actors are often seen as actors merely incentivized by maximizing profit, regulatory frames such as ESG policy at the European level motivate investors and financiers in urban development to create social value or 'to make a social impact'. This shift has led market parties such as real estate developers, housing developers or housing associations developing programs in which they operationalize livability, resident wellbeing or social equity goals –often through citizen engagement approaches. However, given that citizen engagement is relatively new to many market parties, the question occurs to what extent they possess sufficient institutional capacity to practice citizen engagement in an inclusive and meaningful way.

This article presents an in-depth analysis of two cases of citizen engagement practice in the Netherlands in which multiple public, private and civic actors collaborate with citizens to address urban livability aspects. The cases comprise a neighborhood evaluation project initiated by a real estate and construction company on the one hand, and a neighborhood upgrading program initiated by a housing association (in the Netherlands: a non-for-profit market party) on the other hand. The analysis explores how institutional capacity of the various public and private actors involved affect citizen engagement by distinguishing knowledge resources, relational resources and mobility capacity (Healey et al., 2003; Innes & Booher, 2003). Findings reveal how 'formal' capacity aspects such as policies, funding, administrative structures, and assessment methods influence the way that collaborations and citizen engagement are performed but also emphasize how 'informal' capacity aspects such as values, beliefs and habits play a significant role in terms of meaningfulness. By empirically observing the role of market actors in citizen engagement amidst other public and civic actors, this article provides a better understanding of collaborative governance as a way forward in increasing the social value of cities.

The governance of peri-urban areas for inclusive transformations: Challenges of Governance-Cases acting within multi-level conditions (1)

Author: Eva Schmolzmüller¹

¹ *Technical University of Vienna*

Corresponding Author: eva.schmolmueller@tuwien.ac.at

To cope with the multiple contemporary crises (climate, social, economic), cities have eagerly searched for governance approaches which enable an inclusive socio-ecological transformation of their built environment, economies and societies. In the scholarly and policy debate about that issue, peri-urban areas, which are certainly part of the European urban landscape, have been widely neglected. Broadly speaking, peri-urban areas are highly dynamic territories characterized by spatial and demographic fragmentation. They comprise denser cores along the main corridors of public transport and motorways, small towns or villages loosely connected to the mobility network, and, in some cases, vast natural environments which connect these areas to a rural hinterland. Individual mobility is mainly based on the car, although this differs according to the spatial arrangements.

As a result, the urgency of intervening towards inclusive transformations is arguably greater in peri-urban areas than in large cities, as these areas may struggle more to comply with sustainability goals and provide a high quality of life for their inhabitants. This implies that peri-urban areas have a strong incentive to implement effective governance solutions. Addressing the key challenges of peri-urban governance basically means coordinating socio-spatial development in a crowded and complex landscape of policy actors, priorities, scales and borders, which are highly interdependent but have scattered institutional capacity.

In response to this context, our contribution analyses multi-scalar governance initiatives and instruments in an Austrian peri-urban area to critically address to what extent the dynamics, opportunities and limitations of cross-level governance may support, boost, hamper or neglect interventions towards inclusive socio-ecological transformations. Specifically, we discuss whether the overlapping and conflictual spatial scales, sectoral priorities and administrative borders that determine cross-level governance actions can go beyond zero-sum bottlenecks and generic responses that bypass strong, collectively shared goals. Our contribution presents a mapping of actors, instruments and initiatives involved in governance processes in the district of Bruck an der Leitha, a highly dynamic border region situated between two European metropolises, Vienna and Bratislava. As we are focusing on the peri-urban territory in Austria, the research project in general also examines peri-urban regions in Portugal, Belgium and The Netherlands. We are reflecting governance examples against the background of widely differing socio-spatial arrangements, differing perceptions of the regions by its residents, sub-optimal decision-making processes, poorly aligned actors and norms, and messy social choices.

In the peri-urban areas of Bruck an der Leitha there are five governance cases discussed, which touch different levels of governance and transformative topics and basically entail hard and soft governance efforts. These are analysed in detail to understand their impact towards a more accessible region, reachable daily amenities and sustainable mobility.

Preliminary conclusions point to the fact that spatial, social and institutional contexts matter in order to understand and improve governance efforts for inclusive transformations in peri-urban areas.

T_04 GOVERNANCE (B) / 1685**Place-Based Engagement Strategies with Local Communities for better Climate Resilience Governance in Disaster Situations: Putting Principles into Practice for Local Governments****Author:** Luz Navarro¹**Co-authors:** Ana Cristina Fachinelli²; Giulio Verdini¹; Rafael de Lucena Perini²¹ *University of Westminster*² *Universidade de Caxias do Sul***Corresponding Authors:** g.verdini@westminster.ac.uk, l.navarro1@westminster.ac.uk

The increasing frequency and severity of climate-related disasters highlight the urgent need for inclusive and adaptive governance that prioritizes local engagement. Traditional top-down climate strategies often fail to address community-specific needs, leading to ineffective disaster preparedness and long-term adaptation (Ziervogel et al., 2017). Grassroots climate initiatives frequently remain scattered and lack the coordination and resources necessary for a more significant impact (Lovell, 2024). By leveraging local knowledge, authorities can foster innovation, enhance awareness, and strengthen community participation in disaster risk reduction (Dursun et al., 2020). However, many small- and medium-sized cities in Brazil and the Global South lack the institutional capacity to effectively engage residents in climate governance.

This research examines how local authorities can develop place-based engagement strategies to enhance climate resilience governance in Caxias do Sul, Brazil, a region recently devastated by extreme flooding. The May 2024 floods resulted in fatalities, displacement, and widespread infrastructural damage, underscoring the urgent need for more effective disaster governance (Browning, 2021). The disaster exposed critical gaps in local preparedness, and addressing these gaps requires context-sensitive engagement strategies that integrate local knowledge into resilience planning (Hughes & Hoffmann, 2020). Recognizing this, our research employs a participatory, co-design approach, bringing together local government officials, community organizations, businesses, and researchers from Brazil and the UK (Sheffield et al., 2017).

Our paper presents findings from the ESRC-funded project, “Place-Based Engagement Strategies with Local Communities for Better Climate Resilience Governance in Disaster Situations.” The project develops civic engagement strategies for co-designing climate-resilient policies in Caxias do Sul, addressing urgent climate challenges and strengthening community resilience (Baró et al., 2022). The primary objectives are to increase awareness of climate risks and co-develop effective civic engagement strategies to facilitate community involvement in resilience policymaking (Badolo, 2024). Ultimately, it aims to enhance the capacity of local governments to integrate local voices into climate resilience governance (Cannon & Müller Mahn, 2010). This was addressed through four participatory workshops, each focusing on key aspects of climate governance (Malloy et al., 2022). The workshops facilitated the co-development and testing of participatory tools, enabling local authorities and planners to collaboratively shape resilience strategies with residents and stakeholders (Bulkeley et al., 2013). The findings demonstrate that co-designing policies with affected communities leads to more actionable, context-sensitive solutions than conventional top-down governance models (Badolo, 2024).

Our research contributes to the reframing of urban resilience planning as a social and participatory process rather than a purely technocratic endeavor. It highlights the potential of participatory planning in strengthening disaster preparedness and long-term urban resilience while addressing climate vulnerability, emphasizing the need for alternative governance models that prioritize inclusivity, justice, and local agency (Dursun et al., 2020). Additionally, we provide valuable insights for urban planners, policymakers, and researchers interested in developing community-centered climate adaptation policies. By fostering direct collaboration between affected communities and government

officials in climate resilience policy, this research offers a scalable and adaptable framework for integrating participatory governance into climate adaptation strategies (Byskov et al., 2019). We advance broader discussions on climate justice, resilience planning, and co-production in policymaking, offering practical pathways for strengthening local capacities in climate governance (Ziervogel et al., 2017).

Planning social infrastructure in cities: A historical account from Brussels

Author: Jozef Vandermeulen¹

¹ *Vrije Universiteit Brussel*

Corresponding Author: jozef.vandermeulen@vub.be

This paper traces the changing role and conceptualisation of social infrastructure in Brussels'urban planning tradition, paying particular attention to the interactions and power dynamics between the planners, policymakers, and citizens involved. We will examine whether and how these actors have thought about social infrastructure as a category and included it in plans, as well as what the underlying power dynamics and visions were that shaped these decisions. Scholars see social infrastructure as a lever for dealing with global crises at the urban level (Klinenberg, 2018; Latham & Layton, 2022), although this same infrastructure also risks worsening crises by reinforcing inequities or upholding existing power relations (Horton & Penny, 2023). To prevent such adverse effects, the planning process of social infrastructure needs to efficiently involve a wide variety of actors at different scales, fostering generative conflict to drive transformative change that addresses both global challenges and local community needs. By improving our understanding of the evolving ways in which social infrastructure has been approached in Brussels'urban planning since the creation of the Brussels Capital Region in 1989, this paper intends to provide insights into how planning systems in general could be adjusted to enable transformative change. Empirically, the paper (i) reviews existing literature about the history of planning in Brussels (Carlier et al., 2022; Levy, 2015;

Vermeulen, 2015) to map historical trends, (ii) analyses how social infrastructure is approached and discussed in municipal and regional policy and planning documents, (iii) reports on semi-structured interviews with planners, policymakers, activists, and academics to gain insight into underlying power dynamics, (iv) and reconstructs the public debate on social infrastructure by consulting the archives of Brussels-based social movements as well as major news sources.

Before and after the pandemic period: 'Trade districts' in Lombardy and governance of urban and territorial services

Authors: Elettra Barbieri¹; Fulvio Adobati¹

¹ *University of Bergamo*

Corresponding Authors: fulvio.adobati@unibg.it, elettra.barbieri@unibg.it

The COVID-19 pandemic has profoundly affected trade in Italy, highlighting structural weaknesses and catalyzing significant changes in the production and distribution sectors. This aspect emerges prominently in Lombardy, the epicenter in Europe of the health and economic crises.

During this period (2019-2022) the Regional Council of Lombardy has drafted and approved the Multi-Year Programme for the Development of the Commercial Sector-PPSSC, as a policy framework document for the retail trade network in Lombardy. This document provides the fundamental components for the advancement of fixed location retail trade, with particular reference to diverse sales structures, while introducing regulatory measures and proactive policies aimed at rebalancing and integrating the various forms of distribution. The Programme has been outlined and structured by feeding on a debate, which has involved institutions, economic and territorial actors, and that has taken on the transformations of lifestyles and purchasing habits that have emerged with the pandemic crisis, placing the quality of city and territorial living at its core.

The PPSSC identifies six territorial areas of commerce in Lombardy, recognising different conditions of population density and opportunities for integrating the commercial function into the network of services: from metropolitan and urban polarities to mountainous or plain inland areas (suffering from demographic decline and commercial desertification), with intermediate areas made up of medium-density urbanised contexts interdependent with the main urban systems.

Based on the contents of the Monitoring Plan (drawn up as part of the Strategic Environmental Assessment procedure and approved together with the Programme), this research aims to analyse the main trends in the commercial sector that have affected Lombardy before and after the pandemic crisis, and especially to examine the extent to which the pandemic event represented a temporary crisis or, conversely, the beginning of a transition towards new structures and new trends in the commercial sector.

In particular, the research aims to develop the potential role of the “commercial districts” in this transition, promoted as “innovative territorial enhancement methods to promote commerce as an effective aggregation factor capable of activating economic, social and cultural dynamics”.

Two distinct types of District have been defined:

- Urban Trade Districts are established on the territory of a single municipality or part of it;

- Diffuse Districts of Inter-Municipal Relevance are established/settled on the territory of several municipalities.

The mission of the districts is to stimulate and innovate urban commerce, thereby fostering a balance between the various commercial formats. Attractiveness and competitiveness are supported by a unitary direction that, through public-private partnerships, municipalities, enterprises and other local stakeholders, promotes the development of cities and territories, thanks to the pursuit of a shared strategic and investment vision.

It is therefore recommended that commercial districts be tasked with interpreting the two extremes a demand (post Covid) that presents a distinct privileged adherence between the two formulas of the Urban Trade Districts and the Diffuse Districts of Inter-Municipal Relevance:

- a redefinition of commerce in urban areas, based on an emerging focus on the theme of proximity (the obvious reference is to the debate on the 15-Minute City) and on responding to the dynamics of commercial organisation and shopping, increasingly characterised by the digital transition;

- a restructuring of the network of commercial services in inland/low-density areas, identifying on the one hand the synergies of neighborhood establishments with the network of citizenship services, and on the other hand the opportunities for complementarity between the (profitable) retail parks established urban and metropolitan areas and the fragile commercial network of inner areas.

Market-Embedded Collaborative Rural Governance: Three Cases of Village Operations in Hangzhou, China

Author: Ying Sun¹

¹ *Department of Urban and Rural Planning, Zhejiang University of Technology, China*

Corresponding Author: sunying0103@aliyun.com

Since the onset of the 21st century, China's rural revitalization has been predominantly driven by governmental initiatives and fiscal investments, resulting in substantial enhancements to rural living environments and infrastructure development. However, post-construction phases reveal persistent challenges in long-term operations and maintenance, posing sustainability concerns when relying solely on public funding. This predicament necessitates urgent exploration of enduring mechanisms for sustainable village development. Emerging practices in China's economically advanced rural regions demonstrate innovative approaches through market-oriented village operations, representing a proactive response to sustained rural development demands. The integration of market mechanisms into rural governance remains a contentious subject in academic discourse, raising critical questions: Can market-driven operational models genuinely enhance the sustainable supply of villages? What governance frameworks can balance commercial viability with equitable benefit-sharing among stakeholders?

This study examines three representative cases of market-embedded village operations within Hangzhou's metropolitan periphery. Through comparative analysis of operational paradigms, the study elucidates both convergent strategies and divergent approaches, with particular focus on post-market-integration governance mechanisms. The findings aim to inform policy formulation for sustainable rural governance models incorporating market elements.

The study employs a mixed-methods approach drawing from: Two-phase field investigations conducted in July 2023 and August 2024; Triangulated data collection through government archives, digital media analysis, and non-participant observation; Semi-structured interviews with key stakeholders.

The study reveals two principal insights: Market-embedded village operations constitute a pivotal mechanism for rural resource valorization. Strategic intermediation by market entities establishes vital connectivity between village resource endowments and urban market systems. Sustainable market-embedded operations require a collaborative governance, manifested through three relational dimensions. Firstly, market entities must leverage collective mobilization capacity of village organizations to achieve endogenous resource consolidation. Secondly, the institutionalization of benefit-sharing mechanisms among market entities, village collectives, and residents—evolving beyond transactional reciprocity to form resilient developmental collectives—constitutes the institutional bedrock enabling stable village operations and advancing sustainable development trajectories. Thirdly, the ingress of market entities into village ecosystems remains contingent upon governmental proactive institutional guidance and incentive structuring, while the substantive implementation of rural operational initiatives necessitates systemic safeguarding of operational ecosystems and factor markets through comprehensive policy underwriting.

Exploring the Spontaneous Utilization of Industrial Land in Development Zones from an Informality Perspective: A Case Study of the Jincheng Development Zone in Shanxi, China

Author: Shengbin Jiang¹

Co-author: Yuyun Zhang²

¹ *Southeast University*

² *National University of Singapore*

Corresponding Authors: 721047283@qq.com, 18066075746@163.com

In the context of China's rapid economic growth and industrial restructuring, enterprises in midwestern development zones are under considerable operational pressure. Following the influx of a large migrant population, these zones have witnessed increasingly diverse consumer and recreational demands. Consequently, certain industrial sites have been spontaneously converted by property owners to commercial uses to accommodate leisure and consumption needs. Adopting an "informal" research perspective, this paper focuses on this phenomenon by examining the spontaneous renewal of industrial spaces, with the aim of investigating the processes and impacts of such transitions, as well as how planning can balance community aspirations and governmental economic objectives.

To this end, this study selects the Jincheng Development Zone in Shanxi Province, China, as a case example. We examine how large-scale shutdowns of traditional local industrial enterprises have led to the spontaneous repurposing of factory buildings into restaurants, karaoke lounges, automotive repair shops, and sports facilities. Through an analysis of the causes and contexts behind these "informal industrial spaces," we propose a formation mechanism framework that integrates both bottom-up and top-down perspectives across political, social, and market dimensions. The findings reveal: (1) China's current critical phase of industrial transformation is beset by unresolved planning issues at economic and policy levels, leaving existing land-use planning regulations ill-equipped to regulate such informal spaces; (2) the inadequate provision of living and consumption functions within development zones partly drives the conversion of industrial lands to commercial uses; and (3) these developments highlight the dual contradiction between rapid industrialization and existing planning protocols, as well as between local planning efforts and the diverse needs of the populace.

In light of these insights, this paper advocates moving beyond the traditional approach of merely labeling these sites as "inefficient industrial land." Instead, it calls for an informal perspective that balances both human-centered and production-centered considerations.

Moreover, this study innovatively introduces "place vitality" and "public service attributes" as key evaluative factors—where the former provides empirical support for spatial repurposing, and the latter confers a degree of moral responsibility to the use of informal industrial spaces. Accordingly, we classify spontaneously converted informal industrial spaces into four types based on their levels of place vitality and public service attributes, and propose a suite of planning and management strategies tailored to each type.

Ultimately, this paper seeks to reflect upon the tensions between formal planning systems and public demands, advocating for the integration of community-driven, spontaneous renewal efforts into planning processes as a means of realizing spatial inclusivity and justice.

Resilient Transformation spaces: Changing tendencies of planning cultures with a focus on governance in transformation

spaces

Author: Maximilian Schneider¹

¹ *RPTU Kaiserslautern*

Corresponding Author: maximilian.schneider@ru.rptu.de

Author: Maximilian Schneider M.Ed., RPTU Kaiserslautern

Abstract:

Patterns and processes of resilience and vulnerability are playing out in a complex setting of political, socioeconomical and cultural aspects, set on differing time scales and spaces (Gotham and Campanella, 2011). Large-scale traumas or crises like Hurricane Katrina or unprecedented flooding of river valleys like the flood of the Ahr valley in Germany in July 2021 have far-reaching effects on social structures, political decisions, planning cultures and economic situation both within the regions affected as well as further afield.

It is thusly within reason to question, if and how spaces that have been affected by such trauma are feasible as experimental spaces for socioeconomical transformation. Pallagst (2021) defines planning cultures as integral part of national planning systems, thus providing the basis for the hypothesis, that in light of transformational changes, crisis-impacted spaces are fertile ground for comparative research into planning cultures and their evolution when facing crisis shocks. By comparing planning cultures between different regions, changes to cultures in light of crisis impact can be made apparent and innovation in planning practices can be made visible.

This submission is part of a project on comparative research of governance-arrangements in different planning cultures within chosen regions impacted by comparable crises. In this case the flood of the River Ahr in Rhineland-Palatinate in July of 2021 gave motion to the idea of comparing planning cultures across borders, for which the pairing of the river basin of the river Dee in Scotland has been chosen, who itself also was impacted by strong floods in the recent past. By comparing two differing planning cultures impacted by the same crisis, we can gain insight into development paths and evolution of governance-structuring pertaining spatial planning in water-shaped rural middle-mountain regions in Germany as well as abroad, both in the structure and potential for optimization of governance-structures as well as in ways of flood monitoring and prevention with a focus placed on the SUDS-System (D'Arcy, 2013).

By analyzing transformation pathways and governance-structures, we can gain insight into how to build and shape more efficient and resilient planning structures for transformation spaces, especially in light of climate change and future insecurities.

Crossing boundaries and enabling the conversion of military land into social housing. The case of Spain

Author: Federico Camerin¹

Co-author: Juan Luis de las Rivas Sanz ¹

¹ *University of Valladolid*

Corresponding Authors: jlrvivas@uva.es, federico.camerin@uva.es

This study examines the complex challenges inherent in the public-public partnership established in 2023 between SEPES—the Public Land Entity under the Spanish Ministry of Transport, Mobility, and Urban Agenda (MITMA)—and the Ministry of Defence (MoD). The primary objective of this partnership is to repurpose decommissioned military sites for social housing, thereby fostering socially equitable urban regeneration. The initiative encompasses the redevelopment of 8.25 million square meters across 50 MoD-owned assets, facilitating the construction of 19,876 affordable housing units in 34 municipalities within 15 of Spain's 17 Autonomous Communities, with an estimated public investment of €620 million (MITMA, 2023). This project aligns with the broader state-led “Affordable Rental Housing Plan,” which seeks to utilize public land for social housing development, ensuring equitable access to adequate housing as enshrined in the Spanish Constitution. The implementation of this specific public-public partnership entails the transfer of MoD land to SEPES, which is responsible for enabling participatory and inclusive land readjustment while integrating private-sector stakeholders into the redevelopment process.

The central hypothesis of this research is that this innovative collaboration between public entities can reconcile the longstanding tension between the MoD's short-term financial imperative to divest land for revenue generation and the long-term urban and social needs of local communities. Furthermore, this partnership has the potential to navigate the complex process of converting former military sites into civilian uses—a transformation typically fraught with architectural, environmental, legal, financial, and urban planning challenges, particularly in the aftermath of post-2007-08 urban austerity policies. A comparative analysis of two case studies—Madrid's Campamento barracks (a site ready for development) and Valladolid's La Rubia barracks (a site not yet development-ready)—provides empirical insight into the challenges and opportunities associated with the implementation of this public-public partnership in large-scale urban regeneration projects.

The comparison discusses about the wider operation across Spain, in particular it focuses on the broad range of governance arrangements framing planning and enabling transition from the military use to social housing to face the increasing social and economic inequalities. The transformation of these barracks would necessitate enabling specific institutional aspects of planning governance (i.e. the rules, laws, and procedural requirements), as well as the possibilities opened by community practices and actors (co-)operating within these structural settings. This work also discuss how these practices might lead to generative conflicts, institutional learning, and enhanced reflexivity. In fact, the conversion of military land would mean a significant economic investment, which some administrations are reluctant to undertake, particularly in light of existing housing plans within communities such as Castilla y León (La Rubia barracks). These plans are aimed at providing affordable rents for vulnerable populations, in accordance with budgetary allocations that facilitate the progressive acquisition of assets, along with their subsequent rehabilitation and integration into the regional housing stock. In this case, and so far, the criticisms have not been more evident, something that may be due to the fact that, in principle, it will be the Spanish Government itself that will be responsible for purchasing the land from the Ministry of Defence (Campamento barracks). Nevertheless, there are still some reservations as to whether the central government will also be responsible for the building of these social housing units or whether, once again, it will transfer this responsibility to the autonomous communities and local authorities.

Community infrastructure in regional Australia: the impact of community hubs and recreational facilities on social connection, place attachment, and resilience

Author: Suzanne Barker¹

¹ *Monash University*

Corresponding Author: suzanne.barker1@monash.edu

This research explores the role and social value of community infrastructure (McShane, 2006; McShane & Coffey, 2022) in regional Victoria, Australia in fostering social connections and place attachment, enhancing community resilience, and promoting psychological well-being. While facilities such as community hubs and recreational facilities serve as vital hubs for social cohesion, their governance models significantly shape their accessibility, inclusivity, and purpose. Urban planners must critically evaluate these spaces beyond their role as public facilities, acknowledging their potential to perpetuate social inequalities or foster community resilience depending on their ownership and operational frameworks. This exploration highlights the need for nuanced planning approaches to balance community needs with governance complexities. It compares community infrastructure facilities operated by not-for-profit organisations, developers, and councils in Torquay and Armstrong Creek in Geelong, with the view for potential expansion to other locations and types of infrastructure.

The study has two main viewpoints: assessing the effectiveness of specific community infrastructure facilities in building social connections among community members and exploring whether social connection was considered as an outcome in the planning and design of these facilities. The research examines facilities delivered by not-for-profit organisations, developers, and a local government. It begins with community recreational facilities in Torquay operated by a not-for-profit model operated by Royal Automobile Club of Victoria (RACV), then compares it with a developer built and operated community centre in Armstrong Creek built by Villawood Properties using a body corporate model, and a council model in the same local government area of City of Greater Geelong. The findings could inform government policy on community infrastructure in growth areas and regional contexts.

The research employs case study methods involving context analysis of the facilities to understand their design and context, semi-structured interviews with community members who use the facilities, and interviews with RACV, Villawood, and council staff (architects, designers, urban planners, and community planners). The interviews explore the levels of social connection developed using the facilities and analyse the importance of these facilities in facilitating this outcome. Additionally, the research analyses the different business models and considerations used by the various community infrastructure providers and explores whether social connection was an explicit outcome in the planning and design of the facilities, considering any implications for policy to improve outcomes.

This research investigates the relationship between community infrastructure, social connection, psychological well-being, and resilience, offering evidence-based recommendations for policymakers and planners. It emphasises the importance of social outcomes in designing and planning such facilities, advocating for investment to strengthen social cohesion and resilience across regional, urban, and growth areas. The comparative approach provides valuable insights into the effectiveness of various strategies, with potential applications in diverse geographic contexts, including urban transformation settings. Additionally, the study highlights the critical role of governance and operational frameworks in ensuring equitable access and inclusivity in community infrastructure.

This study, therefore, not only highlights the significance of community infrastructure in regional Australia but also provides a framework adaptable to other regions and countries, contributing to global discussions on urban planning and community development.

Participatory Design Processes and Actors in Public Space Case of Buyukada Fayton Square

Authors: Elif Ağaoğlu Yıldırım¹; Elif Kısar Koramaz¹

¹ *Istanbul Technical University, Faculty of Architecture, Department of Landscape Architecture, Istanbul, Turkey*

Corresponding Authors: elif.kisar@gmail.com, elifagaoglu96@gmail.com

Public space is a symbol of democracy. For this reason, it is important to seek democratic methods in the design of public spaces. In this study “Public Participation” essentially means allowing people to be involved in the planning and development of the city, shaping their urban environment, and having the opportunity to be involved in anything and everything that is happening in that space (Kutluca et al., 2022). Participatory design methodologically represents democracy and user involvement in design (Shabab et al., 2018). This concept emerged in the early 1970s with the “aim of removing the barrier between the designer and the user (Kızılkın & Türkyılmaz, 2020).” The main idea is to create an environment which is more livable, economical, and supply-demand relationship by providing a contribution of users besides the architect or designer (Uzer, 2017). Simpson (2015) and Spark (2019) argue that in this context, not only the individual but also civil society organizations, local governments and businesses should contribute to the creation of space in the field of decision making and implementation process. In this pluralistic participation model, the processes summarized as top-down or bottom-up are possible on a plane where actors ranging from municipalities and administrative units to urban activists and neighborhood organizations come together. In this context, design and planning studies serve as a tool that enables different actors to come together.

Büyükkada Fayton Square presents an example of a participatory process in which different actors in public space are involved in the decision-making mechanism at both planning and design stages. Initiated by the Istanbul Metropolitan Municipality in 2019, the Büyükkada Conservation-Oriented Master Plan began with the Islands Transportation Workshop. While planning studies were ongoing, a decision to halt fayton activities was adopted in December 2019. Starting from July 2020, electric vehicles replaced faytons for transportation on the island. In 2021, before the planning studies were finalized, the stop area previously used as a waiting point for faytons was opened to competition under the name Büyükkada Fayton Square Urban Design Competition, shaped by participatory processes with the guidance of a Strategy Document. In this case, participants were included in the process from the preparation stage of the competition brief through focus group discussions, surveys, and thematic meetings. The participatory process continued after project submissions, with finalists revising their projects based on feedback from both the jury and the public. Instead of voting, ideas were exchanged through discussion platforms. While the winning project was delayed due to the pending conservation plan for the Adalar district until 2023, it received approval from the conservation board in June 2024.

The Büyükkada Fayton Square Competition stands out from other urban design competitions in Turkey due to its process and method definition. Re-evaluating the outcomes of this project, which prioritizes the practice of democratization in public spaces, from the perspectives of its stakeholders can contribute to determining participatory tools in future planning and urban design processes.

This paper aims to methodologically classify the roles and inputs of various stakeholders—such as civil society, local residents, the municipality, and designers—in the participatory process of Büyükkada Fayton Square. This classification relies on primary materials such as jury reports and video recordings of online public meetings held during the process. Additionally, face-to-face interviews are conducted to supplement and deepen the analysis. This paper identifies which actors and which participation tools influenced the decision-making mechanisms in the process from planning to implementation, and draws attention to the differentiated form of public participation that began as provocative actions in the context of exercising the people's democratic rights in the example of Büyükkada Fayton Square.

Who will plan for “ageing in place”? Governance of affordable housing for a growing senior population in Switzerland

Author: Deniz Ay¹

¹ *University of Bern*

Corresponding Author: deniz.ay@unibe.ch

The growing percentage of seniors as a demographic trend presents significant societal challenges, impacting various aspects of urban life, including housing policy and spatial development (Huang, 2015). On one hand, changing housing needs—such as accessibility features, smaller units, and affordability—demand housing redevelopment (Luciano et al., 2020). On the other hand, there is an increasing mismatch between the rising demand for elderly care and society’s limited capacity to provide it, creating a widening care gap, particularly for low- and middle-income groups (Black, 2020). As the demand for barrier-free, smaller, and more affordable housing units rises, municipalities need to navigate the challenge at the intersection of land policy, social policy, and housing provision to support “ageing in place” (Lowies & Lushington, 2024). Despite the policy emphasis on enabling older adults to remain in their homes and communities, affordable housing for seniors remains an overlooked yet pressing governance issue in rapidly ageing societies, including Switzerland (Schwiter et al., 2018).

This paper examines how municipal, cooperative, and private actors respond to the growing demand for age-appropriate housing arrangements given the institutional context of land policy, social policy, and business interests in the growing elder care sector. Through a multiple case study of five housing projects in the Canton of Bern, I explore the governance of age-appropriate housing provision. The highly decentralized housing, land, and ageing policies in Swiss context provide a rich empirical context for different spatial, social, and economic interests involved in “ageing in place”. Findings suggest that housing cooperatives deploy distinct strategies to integrate housing and care, yet face challenges in affordability, accessibility, and long-term sustainability. Municipal priorities, particularly in efficiency in land allocation and keeping a balanced age composition of residents, significantly shape the extent to which senior housing is developed and how responsibilities for care are negotiated among public, private, and cooperative actors.

By situating age-appropriate housing within broader municipal planning and urban governance debates, this paper raises critical questions about who is responsible for planning and financing housing for changing demographics and how different governance arrangements either enable or constrain the capacity to ensure long-term affordability and care provision to mitigate the growing care gaps, particularly in cities. The study contributes to discussions on municipal planning, cooperative housing models, and the governance of ageing in cities, offering insights into the evolving role of local governments and community-based initiatives in mitigating the housing and care crisis beyond ageing communities.

Identifying Barriers to Compact Urban Growth in the Irish Housing Sector: Insights from Industry Experts

Authors: Rola Abu Hilal¹; Philip Crowe¹; Gillian Brady²; Brian Crowley³

¹ *University College Dublin*

² *Atlantic Technological University of Sligo*

³ *Irish Green Building Council*

Corresponding Authors: rola.abuhilal@ucd.ie, philip.crowe@ucd.ie, gillianrbrady@gmail.com

Low-rise, low-density housing dominates Ireland's housing sector, even as growing housing demand and ambitious carbon reduction targets necessitate a shift toward sustainable development. Compact urban growth (CUG) has emerged as a critical strategy to address these challenges, offering transformative environmental, social, and economic benefits. Promoted in key policies such as the National Planning Framework, CUG aims to reduce emissions, enhance urban vibrancy, and optimise land use. However, low-density development persists, contradicting these policy objectives. This paper will investigate this contradiction, exploring the barriers to the adoption of CUG in Ireland. It gathers insights from housing industry experts to highlight the disconnect between policy intentions and actual housing delivery.

The study adopts a qualitative approach, conducting semi-structured interviews with housing experts, including developers, architects, and housing bodies, to identify barriers hindering the adoption of compact urban growth (CUG) in Ireland. These interviews focused on key themes such as the viability of housing typologies, the role of embodied carbon in housing design, and the future trajectory of housing development in Ireland.

The research identifies barriers, such as market preferences for low-density housing driven by consumer demand and limited awareness of alternatives, regulatory constraints, and spatial requirements that challenge higher-density developments. Additionally, car-centric planning practices within local authorities exacerbate the issue. Together, these factors perpetuate high-carbon, low-density development, underscoring a critical misalignment between national policies and actual housing delivery.

This study provides essential insights into these obstacles and offers a foundation for developing actionable pathways to align housing practices with policy objectives. The findings are crucial for advancing sustainable urban development, achieving Ireland's housing and carbon reduction goals, and offering lessons for other nations navigating similar transitions.

Compact Urban Growth; Sustainable Housing; Regulatory Barriers; Embodied Carbon

T_04 GOVERNANCE (B) / 622**Transit Fragmentation as a Governance Challenge: Comparing Formal & Informal Institutions Facilitating or Hindering Cross-Agency Transit Coordination in the US & Europe.****Author:** David Weinreich¹**Co-author:** Håvard Haarstad ¹¹ *University of Bergen***Corresponding Authors:** havard.haarstad@uib.no, david.weinreich@uib.no

Longstanding institutional fragmentation of public transport services leads to service gaps, poor coordination and discourages ridership. The current conversations about service adaptation are shining a light on long-standing transport institutional challenges like fragmentation, inconsistent fare structures & financing and lack of coverage. In many cities, there are multiple operators, private and public, multiple cities, counties, tendering agreements and funding systems in place. Governance shapes the frequency of transfers and their difficulty, affecting ridership (Miller et al., 2005; Walker, 2012). This includes the existence and ease of cross-operator ticketing (Buehler et al., 2017), schedule coordination, terminal and app sharing, and data coordination (Rivasplata, 2012).

This paper examines cases in Europe and the US chosen to represent different transit governance models, and conducts in-depth qualitative interview and document analysis to identify how the level of government at which public transport is funded impacts transit agencies' ability to coordinate services. This paper looks at two metro regions in Europe and two in the US, with one region on each continent being locally governed & funded and one region governed and funded at a higher level of government (e.g. regional, federal state, or national). For each case, we interview agency CEOs or staff responsible for service planning to understand how their funding and governance structure help or hinder their ability to coordinate services.

We also examine a combination of annual reports, policy documents, tax collection information, fare policies and interagency agreements/ MOUs, in order to understand the link between governance and service outcomes like coverage and trip time to work. The interviews highlight the challenges of integrating services under each governance model, focusing especially on the degree of local autonomy in decision making. We focus in particular on how funding sources supporting public transport affect interagency agreements; coordination of tickets, schedules and routes. This work adds detail to the literature of transport governance, building off of previous literature documenting the range of regional transport governing structures (Weinreich & Skuzinski, 2021), measuring levels of fragmentation (Skuzinski et al., 2022 & 2023), and studying how governing structures developed over time (Weinreich & Bonakdar, 2020).

Findings focus on the role of higher levels of government in helping support services (or hinder them), the power that local transit agencies have to improve service or barriers to doing this, and formal or informal institutions local transit agencies have created to coordinate services independent of higher levels of government.

T_04 GOVERNANCE (B) / 509**Governance for Bioeconomy Planning across Territorial Boundaries****Author:** Jon Paul Faulkner¹**Co-authors:** Enda Murphy²; Mark Scott²¹ *University College Dublin Ireland*² *University College Dublin***Corresponding Authors:** jon.faulkner@ucd.ie, enda.murphy@ucd.ie, mark.scott@ucd.ie

This paper explores governance frameworks and transferable policy innovations within the European bioeconomy planning context, drawing insights from Germany, France, and Belgium to address planning challenges for developing the bioeconomy in counties with slow development such as Ireland. It situates the bioeconomy as a transformative regional planning concept requiring multi-level governance, transboundary collaboration, and inclusive institutional mechanisms to foster sustainability and regional equity. Key governance dimensions are identified, including multi-level coordination, participatory governance, and reflexive science-policy interfaces. German innovations, such as the National Research Strategy Bioeconomy 2030, highlight the importance of balanced funding models that combine long-term institutional stability with adaptive project-specific investments. France's participatory frameworks and Belgium's cluster-based initiatives further emphasise the need for inclusive stakeholder engagement and regional adaptability. These approaches inform the potential for regions to develop Bioeconomy Hubs, fostering cross-sectoral innovation clusters and living labs as platforms for localised experimentation. The paper focuses on critical themes such as equitable resource management, socio-economic inclusivity, and environmental sustainability in regional planning. France's cascading biomass use principle and Belgium's circular economy integration offer replicable models to harmonise regional planning for economic development in coordination with ecological preservation. Regional planning systems, in Ireland as elsewhere, must incorporate bioeconomy governance frameworks to address land-use conflicts, support small enterprises, and ensure robust public-private partnerships to drive innovation while mitigating socio-environmental trade-offs. By aligning with EU priorities, leveraging transnational collaborations, and embedding reflexive and participatory governance practices, regional planning can create a bioeconomy that transcends traditional administrative silos and territorial boundaries. This study demonstrates how the interplay of institutions, actors, and ideas can enable transformative governance to better position regions with slower development as leaders in sustainable bioeconomic planning, providing valuable insights for planning disciplines worldwide.

T_04 GOVERNANCE (B) / 296**Productive Cities Down Under?: The contested governance of industrial land and the challenge of planning for urban industry in Australia****Author:** Carl Grodach¹**Co-authors:** Joe Hurley²; Liz Taylor¹¹ *Monash University*

² RMIT

Corresponding Authors: liz.taylor@monash.edu, carl.grodach@monash.edu, joe.hurley@rmit.edu.au

In this research we explore how urban planners negotiate and respond to changing industry and land use governance contexts. We seek to better understand if and how planning systems adapt in response to emerging and ongoing urban challenges. Our focus is on urban industrial land use planning and the role of planners in shaping productive city futures oriented toward reintegrating manufacturing into the city (European Commission 2020).

Pandemic-era supply chain disruptions, climate threats, and geopolitical insecurity have engendered massive federal investments in reshoring manufacturing and growing local production across the globe through programs such as the European Commission's Green Deal Industrial Plan and the Australian Government's A Future Made in Australia (Middleton 2024). Yet in cities with competitive land markets, the rezoning and redevelopment of industrial areas to other uses has dramatically reduced industrial land supply and created hyper-competitive industrial property markets that threaten these investments (Ferm, 2023; Grodach, 2022). There is growing interest in promoting advanced, digitized manufacturing integrated in cities, yet this often overshadows the ongoing need for basic industrial services that enable cities to function. Moreover, industrial firms increasingly defy traditional categories, blurring the line between production and service functions. All of these factors complicate traditional industrial land use separation and containment strategies.

In this context, we focus on how planners in Australia's three largest cities- Brisbane, Melbourne, and Sydney- implement policy narratives and ideas around industrial land and activity. We examine the ways in which planning professionals conceptualize and manage changing industry, how they imagine and plan for the needs of current and future industrial land, and explore practitioner narratives on industrial land protection, innovation, and transition. We then contrast this to industrial firm experiences with the planning system. We focus in particular on smaller, low impact firms that may be integrated into urban areas under productive city mandates to understand how they navigate contemporary industrial governance settings, planning imaginaries and regulatory contexts. The analysis reveals a variety of often competing ideas within and between local and regional governments and between planners and firms around the nature of industrial land. Findings highlight the tensions and challenges of implementing productive city mandates due to governance frameworks and regulatory processes, enterprise needs, and property market realities.

Co-Creating Just Energy Transitions with Vulnerable Communities: Lessons from Local and Regional Energy and Regeneration Policies

Author: Kasia Piskorek¹

Co-author: Agnieszka Szumilas¹

¹ *Wroclaw University of Science and Technology*

Corresponding Authors: agnieszka.szumilas@pwr.edu.pl, katarzyna.piskorek@pwr.wroc.pl

The success of energy transitions depends not only on technological advancements and funding mechanisms but also on the ability of local and regional policies to effectively engage communities. Just energy transition requires special attention to disadvantaged communities' needs and capacities for transformation.

Despite increasing policy attention, marginalised neighbourhoods often face systemic barriers to participation, limiting their influence on decision-making and access to the benefits of energy and revitalisation initiatives. This paper examines how urban governance, stakeholder engagement strategies, and funding frameworks can foster more inclusive transitions by empowering underrepresented communities.

Using an in-depth case study of Wroclaw (a city which, on one hand, struggles with immense pollution and has an aspiration to achieve carbon neutrality by 2030 as one of the EU's Mission Cities, on the other), supplemented by insights from other European cities, this research explores different practices of community participation in energy transition and urban regeneration. It focuses on how local governments, civil society, and private actors co-develop solutions with residents in socio-economically disadvantaged neighbourhoods. The study employs a qualitative comparative approach, combining policy analysis, interviews with key stakeholders (municipal authorities, NGOs, and community groups), and spatial mapping of neighbourhood transformation.

Findings reveal that while multiple funding streams support energy and revitalisation projects, they often fail to reach those most in need due to bureaucratic complexities, lack of community awareness, and insufficient participatory mechanisms. The paper argues for a governance model that prioritises inclusive co-creation, knowledge transfer, and long-term stakeholder collaboration. Building on theories of energy justice (Jenkins et al., 2016), participatory urban governance (Healey, 1998), and social innovation in sustainability transitions (Avelino et al., 2019), the study proposes a framework for strengthening multi-level governance and grassroots involvement in policy implementation.

The research contributes to the discourse on inclusive urban transitions by highlighting best practices and challenges from European cities. It offers policy recommendations to enhance the role of disadvantaged communities in shaping local and regional sustainability agendas.

T_04 GOVERNANCE (B) / 1328**Understanding governance as a dynamic local response: England's Civil Society Organisations in the changing landscape of urban governance****Author:** Hyunji Cho¹**Co-authors:** Elisabeta Ilie²; Lucy Natarajan²¹ *Trinity College Dublin*² *University College London***Corresponding Authors:** e.ilie@ucl.ac.uk, hcho@tcd.ie, lucy.natarajan@ucl.ac.uk

This paper examines the role of civil society organisations (CSOs) within the shifting landscape of England's urban governance amid political and economic upheavals. Focusing on the interplay between 'urban crises' and 'local practices', the study investigates how CSOs navigate challenges posed by neoliberal policies, austerity measures, and the COVID-19 pandemic. Drawing on qualitative data from 65 CSOs, it explores how these organisations bridge gaps between centralised priorities and grassroots needs through locally-driven initiatives, social learning processes, and solidarity-making efforts. Contrary to perceptions of CSOs as passive recipients of government funding, the findings reveal their role as proactive intermediaries bridging policy frameworks and community realities. CSOs tackle systemic pressures such as social isolation, economic inequality, and declining civic engagement, particularly among marginalised groups like youth and low-income populations. By leveraging local knowledge, they advocate for inclusive and community-centred responses, challenge structural inequalities, and adapt to the constraints of austerity urbanism. This research emphasises the importance of recognising CSOs' critical role in reshaping governance models and planning practices to reflect local contexts. It contributes to urban governance discourse by highlighting the adaptability and agency of CSOs in addressing socio-political challenges and advancing democratic planning.

T_04 GOVERNANCE (B) / 843**Housing cultural futures: The role of Norwegian 'kulturhus' in local urban development and planning****Author:** Diana Huynh¹**Co-author:** Even Smith Wergeland²¹ *Norwegian University of Life Sciences, Faculty of Landscape and Society*² *Oslo School of Architecture and Design***Corresponding Authors:** even.smith.wergeland@aho.no, diana.huynh@nmbu.no

In Norway, there are currently more than 130 operational culture houses, so-called 'kulturhus'. Historically, these have served a range of purposes, providing important infrastructure for cultural activities and other community services. The early 2000s marked a proliferation in the demand to plan and construct new culture houses across the country, fueled by a conviction that tailor-made buildings are indispensable in the provision of cultural services and experiences. This is evident in the public expenditure, which show that billions NOK were allocated in the first decades of this century.

Yet, how important are culture houses today, when citizens increasingly turn to digital culture to satisfy their appetite for arts and entertainment? What purpose do they serve

and for whom? And what motivated local governments to build them to begin with? Over the past decades, it is obvious that there has been a growing interest in how culture, and subsequently the buildings that host cultural activities, play a significant role in local and regional development, often following theories and practices emerging from Bilbao's reverberating Guggenheim effect. While these cultural centres - many envisioned as regional landmarks - have been planned across the country, trends show that small and medium-sized cities are experiencing population decline and growth stagnation. Indeed, much points to the fact that Norwegian municipalities face an increasingly challenging set of development issues. In addition to imbalanced demographics, most municipalities grapple with vulnerable post-pandemic economies, coupled with the demands of climate change adaptation and mitigation, as well as an increasingly unpredictable geopolitical order. Most places would be hard-pressed to manage high operating costs linked to cultural centres on top of these governance tasks. To this end, the paper argues that, for better or worse, perhaps these culture houses serve as stand-in for those that govern us.

The paper seeks nevertheless to also extend the scholarship on Norwegian 'kulturhus' by investigating how they are used and managed within the context of cultural policies and economic realities. While the focus is on the Norwegian context, both Nordic and European outlooks are given comparative attention. Given current pressure placed on public expenditure, the culture house of the future has probably already been built — how can, and in what ways should it, stay relevant?

Collaborative Governance of Public Urban Gardening: Theoretical and Methodological Insights from Greater Sydney

Author: Kristina Ulm¹

Co-authors: Evelyn de Leeuw²; David Sanderson¹; Oona Morrow³; Alec Thornton¹

¹ *University of New South Wales*

² *Université de Montréal*

³ *Wageningen University & Research*

Corresponding Author: k.ulm@unsw.edu.au

This study examines the governance dynamics of community-based street greening initiatives in Greater Sydney, Australia, focusing on the interactions between local governments and citizens in transforming public spaces into small-scale gardens. These urban gardening efforts, occurring in nature strips, verges, and footpaths, are often informal, community-driven projects that require innovative governance approaches to balance the needs of both public authorities and residents. The study explores the policy frameworks employed by local governments to regulate public urban gardening and investigates the day-to-day decision-making processes of policy officers and community members.

To investigate the complex dynamics between formal policy and informal, community-driven action, a novel, interdisciplinary governance framework has been developed, drawing on policy studies and systems theories. A qualitative analysis of policy documents across all thirty-three local governments in Greater Sydney reveals a broad spectrum of policy approaches—from restrictive measures to proactive support for public gardening initiatives. Interviews with council staff and community participants uncover the governance practices surrounding these initiatives, focusing on how policy

decisions are implemented at the street level. By employing a participatory systems approach, the research highlights the diverse perspectives and values that shape policy outcomes, particularly in relation to risk management, biodiversity, and community benefits.

The study contributes to the discourse on governance by offering insights into how participatory and flexible governance models can enable adaptive urban planning processes. The findings are relevant for policymakers seeking to foster collaborative, community-led urban solutions that address pressing challenges such as climate adaptation, social cohesion, and environmental sustainability.

Shaping Age-Friendly Communities: Towards More Inclusive Participation of Older Adults in Neighbourhood Planning

Author: Xinyue Dong¹

¹ *The University of Manchester*

Corresponding Author: xinyue.dong@manchester.ac.uk

Population ageing is one of the major challenges facing cities today. As life expectancy continues to rise faster than healthy life expectancy, it poses challenges for the built environment in supporting older adults' lives. Driven by the growing importance of social ecological and gerontological theories on how the environments significantly influence older adults' health, mobility, and social engagement—and considering the challenges faced by this demographic—several strategies and policies, particularly the World Health Organisation's Age-Friendly Cities and Communities (WHO AFCCs) initiative, have been implemented to address the specific needs of older adults (Lawton and Nahemow, 1973; Lui et al., 2009).

The AFCCs initiative has generated a global response, raising awareness among planners of the potential for involving older adults in urban planning and community regeneration strategies (Buffel et al., 2014). While the physical environment and outdoor spaces are recognised as core areas in the AFCCs' eight dimensions, much of the relevant literature appears in gerontology and health policy journals rather than urban planning and design publications, highlighting the need for further research into spatial interventions (Salmistu and Kotval, 2023).

In recent years, planning discourse has shifted significantly from a top-down approach to a more communicative style. This shift emphasises the importance of including diverse voices in planning processes to create inclusive environments for all age groups. Active participation of older adults in community planning is essential, not only to improve their quality of life but also to safeguard their rights in urban spaces and foster age-friendly environments. However, research on age-friendly community planning remains insufficient, particularly in varied local contexts (Atkins, 2019).

In the UK, Neighbourhood Planning (NP), introduced by the Localism Act 2011 as a collaborative, community-level planning initiative, offers older residents opportunities to influence local planning discussions and promote more inclusive and age-friendly outcomes. However, ensuring the meaningful inclusion of older adults in NP faces considerable challenges. These arise from demographic, individual, and community environmental factors affecting older people's social participation (Townsend, Chen and Wuthrich,

2021) and barriers inherent in the NP participation process itself (Brookfield, 2017). Despite these challenges, the factors influencing older adults' participation in NP and strategies for improvement remain underexplored.

This research aims to identify and categorise the factors that influence older adults' (aged 65 and above) participation in NP and to explore innovative and inclusive engagement approaches to encourage their involvement. It adopts a mixed-methods approach, incorporating quantitative data from surveys and qualitative data from interviews conducted at two levels: nationally across England and through a case study in Leeds.

Findings reveal how personal level factors, community level factors, and NP process-related factors influence older adults' participation. Key factors include health and age-related constraints, socio-economic conditions, attitudes towards ageing, trust in the planning system, and challenges in planning competence and coordination, etc.

Additionally, innovative strategies to encourage older adults' participation in NP are explored. These include the use of artist impressions and exhibitions to simplify planning concepts, creative outreach methods such as art projects and multilingual engagement, and trust-building activities. Community engagement officers played a pivotal role in implementing these approaches to involve marginalised groups, including older adults and culturally diverse residents.

By identifying barriers and proposing inclusive practices, this study contributes to fostering a more age-friendly planning participation process, enabling older adults to actively participate in shaping their community environments.

Self-government processes of the urban bioregion: insights from a study on the Metropolitan City of Rome Capital

Author: Giovanni Ottaviano¹

Co-authors: Luciano De Bonis¹; Francesca Giangrande¹

¹ *University of Molise*

Corresponding Authors: luciano.debonis@unimol.it, francesca.giangrande@unimol.it, giovanni.ottaviano@unimol.it

The contribution presents partial findings from the work carried out by the authors within the ongoing PRIN (Research Project of Significant National Interest) PNRR project “Bioregional planning tools to co-design life places. Empowering local communities to manage and protect natural resources”, in particular with regard to the denotation of experiences of territorial governance that extend beyond traditional institutional planning frameworks. Grounded on the bioregional approach, the research project aims to contribute to the definition of a set of agreement tools for territorial planning, supporting collaborative forms of management and use of environmental resources by the communities that live in the territory. The agreement forms of planning identified in the project are intended as flexible frameworks for the definition, case by case, of the most suitable tools to allow the implementation of the principle of subsidiarity in the perspective of addressing local and global challenges more effectively.

The authors’ research focus is the urban bioregion of the Metropolitan City of Rome Capital, and this contribution concerns in particular the denotation and mapping of the “multiform experiences that use various tools of local action” (Dematteis, Magnaghi, 2018) observed within the study area. For this purpose, different types of experiences have been identified, ranging from semi-institutional processes of agreement planning of parts of the territory (such as river contracts) to community-led self-government of commons, offering a comprehensive picture of the forms of land management that complement conventional institutional planning.

The reconnaissance of the experiences made use of an online collaborative mapping tool, in order to allow interaction and integration between the knowledge base developed within the research project and the knowledge that can be produced by any other user. The embedding of the mapping tool within a specifically developed geosocial platform also allows for broader forms of social interaction between users, and aims to support the creation of multiple communities interested in participating in the processes and practices of land use and governance. Ultimately, the project aims to encourage the progressive formation of new institutions empowered to self-governing territorial resources.

Learning from the social innovation-institution relationship. An ethnographic study in the Veneto Region

Authors: Naomi Pedri Stocco¹; Martina Bovo¹; Elena Ostanel¹; Laura Fregolent¹

¹ IUAV University of Venice

Corresponding Authors: npedristocco@iuav.it, mbovo@iuav.it, ostanel@iuav.it

Social innovation has long been hailed for its potential to tackle urgent social and economic challenges, particularly in academic and policy circles. It is seen as a means of enhancing local welfare by generating public goods and services while promoting collective empowerment. From a planning perspective, social innovation is viewed as a transformative tool capable of reshaping social relations and altering power dynamics within communities. However, critical literature has raised concerns about its overromanticisation and the rhetoric of governance-beyond-the-state, particularly regarding the notion that social innovation could justify the state's retreat from addressing systemic issues such as exclusion, deprivation, and inequality. Additionally, critiques highlight the uneven distribution of social innovation initiatives and their potential to exacerbate existing disparities.

While it is widely acknowledged that local communities alone cannot resolve entrenched societal issues, a more nuanced understanding of the relationship between social innovation and institutions - particularly in urban planning - is still lacking.

Emerging research underscores that public support is critical to the sustainability of social innovation and its ability to scale beyond micro-level interventions. **This contribution focuses on the relationship between social innovation initiatives and local institutions, exploring how both “learn” from one another to improve public action and urban planning practices.** On one hand, we investigate how civic initiatives develop competencies and awareness through their interactions with institutions. On the other hand, we explore how institutions, conceived as evolving learning bodies, gain insights through engagement with social innovation initiatives. The Veneto Region, particularly the city of Verona, serves as the field of observation for this study. This region has a long-standing tradition of faith-based civic action and a robust associative fabric. Verona shares this tradition with the wider region, but in the past ten years, the Municipality has become more directly involved in collaborative management of common goods - alongside other Italian cities. Based on a mapping of existing civic initiatives that address emerging and unmet needs, this research examines their relationship with local institutions, particularly the municipal government, and investigates the learning processes triggered by these interactions, both for the social innovation initiatives and for local institutions.

First, in-depth interviews with key local actors and policymakers reveal the spatial, social, and institutional factors shaping their relationships. For instance, the municipality's efforts toward social innovation and horizontal subsidiarity create a generative space for exchange. However, it is essential to critically assess which types of initiatives (and needs) the Municipality is capable of addressing, and to what extent it can foster processes of learning and awareness. The role of other actors, such as private foundations and universities, also emerges as critical in this dynamic. Secondly, institutional ethnography conducted within the Municipality of Verona further explores the learning process within local institutions. This analysis examines political cultures, competencies, organizational structures, methods, tools, procedures, and dynamics to identify elements that facilitate institutional learning and transformation in response to social innovation initiatives and, more broadly, evolving societal needs. Through these research activities and findings, the paper highlights the critical role of the relationship between social innovation and institutions—beyond just civic action initiatives—in addressing contemporary crises and evolving societal needs, while proposing a dynamic definition of social innovation, particularly within the context of urban planning.

This contribution is part of the broader research project RESISTING –Reconnecting Social Innovation with Institutions in Urban Planning, funded under the National Research Program of National Interest (PRIN NRRP 2022), within Italy's National Recovery and Resilience Plan. RESISTING studies three different Italian regional contexts.

Exploring the Future of Metropolitan Governance: Metropolitan Management and Regional Development in Decentralized Indonesia

Author: Hisako Kobayashi^{None}

Corresponding Author: hisakook@gmail.com

This research aims to explore appropriate metropolitan management mechanisms through the analysis of Indonesian cases. Indonesia has experienced rapid urbanization over the past few decades. Before the turn of the century, nearly 60% of Indonesia's population still lived in rural areas. However, today, the urban and rural population ratios have completely reversed. By 2023, the urban population accounted for almost 60% of the total population, and it is expected to exceed 70% by 2045. Indonesian cities are currently facing major challenges, such as creation of livable urban environment while coping with rapid urbanization and sprawling, economic development and job creation, and provision of the public and social services to meet the needs of the growing urban population.

As urbanization progresses, large metropolitan areas have emerged, making metropolitan management an important issue in Indonesia's urban sector. Due to the benefits of agglomeration economies, metropolitan areas are generally recognized as drivers of the national and regional economy. However, these areas also experience negative externalities, such as traffic congestion, pollution and environmental degradation, insufficient affordable housing, and a lack of open space. Recognizing the importance of metropolitan areas, the National Spatial Plan of 2008 defined a "metropolitan area" as an urban agglomeration with a population of over one million that is functionally integrated. Ten metropolitan areas were officially identified under this framework. Recently, metropolitan management has received renewed attention, particularly with the enactment of Law No. 2 of 2024 for the development of the Jakarta Metropolitan Area following the transfer of the national capital in Nusantara, Kalimantan. Promoting regional development depends on building systems that foster cooperation and coordination among local governments within a metropolitan area. This has sparked interest in metropolitan management and its institutional framework, especially from the perspective of regional development. Examples of ongoing initiatives include the development of a new metropolitan area integrating Nusantara, Balikpapan, and Samarinda in East Kalimantan, and the Rebana Area Development Project in West Java, which is one of the national strategic projects.

On the other hand, Indonesia has implemented a drastic decentralization policy known as the "Big Bang Decentralization" since the late 1990s. Following the enactment of Law No. 22 and Law No. 25 of 1999, significant authority was devolved to districts (regencies and cities) in areas such as economic development, spatial and infrastructure planning, environmental management, and public service provision. In 2004 and 2014, adjustments were made to clarify the division of functions and relationships between provinces, districts, and villages. This involves strengthening the role of provinces and implementing fiscal decentralization at the village level through the establishment of the Village Fund. After several modifications and the accumulation of experience, recent research has revealed that decentralization in Indonesia has contributed to the alleviation of regional disparities to some extent. However, an unintended consequence of decentralization has been the proliferation of local governments, including new districts and provinces, leading to a trend of fragmentation, often based on political interest. In essence, Indonesia's decentralization framework, while strongly empowering local governments, does not necessarily encourage cooperation between neighboring local governments.

Thus, the objective of this research is to examine metropolitan mechanisms that support intergovernmental cooperation for regional development within Indonesia's decentralized system. This is achieved through three case studies: the Jakarta

Metropolitan Area, the new national capital metropolitan area, and the Rebana Area in West Java. These case studies analyze the specific issues faced by each metropolitan area, such as public transportation systems in the Jakarta Metropolitan Area, the establishment of the new capital and its broader impacts, and regional development with a focus on industrial growth in the Rebana Area.

Energy Transition and Community Engagement: The case of NSW, Australia

Author: Sanaz Alian¹

¹ *University of New England*

Corresponding Author: salian2@une.edu.au

Using renewable energy sources is not a new phenomenon in Australia. In 2023, 39.4% of the country's total electricity generation came from renewable energy sources with NSW the highest user of renewables in Australian states in terms of megawatts (Clean Energy Council, 2024). Using more renewable sources for energy became a priority in Australia and many other parties involved in "The Paris Agreement". Australia lodged the 43% emissions reduction target by 2030 under this Agreement in 2022 and the Climate Change Act (2022) was in force in April 2023 to make sure that Australia will reach Net Zero emission by 2025. This also coincides with the closure of various coal-fired power stations in Australia.

These large-scale renewable energy developments are usually considered State Significant Developments (SSDs). In NSW, the Minister for Planning and Public Spaces (the Minister) or their delegate is usually the consent authority for SSDs. The process of assessing these applications is complex and comprehensive and requires an Environmental Impact Statement to identify project impacts, along with extensive community consultation (McElnea & Alian, 2024). While this might be 'comprehensive', the International Association for Impact Assessment (2023) observes that "Traditional environmental impact assessment conducted at the individual project level has proven to be insufficient to deal with the bigger picture beyond project level impacts".

National and State governments have published and released various policies, frameworks, and factsheets about the impacts of these projects including what they mean for the communities affected and how they can be 'involved' in the process of decision-making. At the state level, the recent Climate Change (Net Zero Future) Act 2023 (Part 2, Section 8) specifies that: "Action to address climate change should be taken in a way that ...considers the impact on rural, regional, and remote communities in New South Wales". It should "involve appropriate consultation with affected persons, communities and stakeholders" and it should consider other matters including but not limited to the knowledge and perspectives of Aboriginal communities as well as the knowledge of rural, regional and remote communities in NSW. Amongst other things, this Act also states the need "to support local communities, including Aboriginal communities, who may be affected by the action".

This project explores a key set of tensions in relation to planning for renewable energy projects in rural New South Wales (NSW), Australia. On the one hand, these projects are responding to clear global imperatives to transition to carbon-neutral societies, along with the understanding that any further delays could prove disastrous for the planet. On the other hand, it is also clear that these projects will significantly affect host communities in a range of ways and that wide-ranging community engagement is required to ensure that negative impacts are mitigated and positive impacts enhanced. From a societal perspective, there is an imperative to act 'now' and yet, at the local scale at least, also a critical need to ensure that these projects generate beneficial and enduring outcomes for host communities, many of whom are keen to participate in and benefit from the potential renewable's 'boom'.

Drawing on the social and economic impacts of other Renewable Energy Zones (REZ) on its host communities, this project will explore the extent to which affected local towns and communities in the New England REZ have been meaningfully engaged with the

highly complex planning framework associated with this renewable mega-project, and how levels of engagement and strategic involvement can be improved.

Rural Revitalization Beyond Administrative Boundaries: A Case Study of Villages Surrounding Taihu Lake, China

Author: Yuhang Rao¹

¹ *Department of Urban Planning, Tongji University, Shanghai*

Corresponding Author: 2330319@tongji.edu.cn

Rural development, aimed at reducing the disparities between urban and rural areas, remains a significant global challenge under climate change, land conflicts, food insecurity, and environmental degradation. UN-Habitat has proposed enhancing urban-rural linkages as a means to address this issue. In China, rural revitalization has been promoted as a national strategy through enhancing the flow of development factors between urban and rural areas. This shift reflects a transition in China's policy from a "dual urban-rural system" to "urban-rural integration" leading to substantial improvements in urban-rural linkages, such as transportation, energy, internet access, technology, and talent exchange. Despite these advancements, local governments continue to face challenges due to the constraints of administrative boundaries, resulting in issues such as uneven resource distribution, limited physical and social mobility, and ineffective governance. Overcoming these limitations and fostering rural development beyond administrative boundaries are essential for achieving regional coordination and enhancing rural governance.

This study examines villages around Taihu Lake in Huzhou, China, to explore approaches that encourage coordinated development beyond the administrative boundaries in rural areas. Huzhou was designated as a national pilot zone for urban-rural integration in 2019, leading to the selection of villages in Huzhou as study sites based on several pilot studies conducted in the Yangtze River Delta. The city has actively pursued initiatives to facilitate the flow of development factors between urban and rural areas, promoting rural development through land use, population mobility, and shared infrastructure.

Using archival research, location-based data analysis, census data analysis, field visits, participatory observations, and in-depth interviews, the study focuses on the development agendas and strategies of each village, cooperative activities in economic, social, and ecological dimensions, and the interactive mechanisms between villages under the

guidance of local towns or sub-districts. The study aims to address key questions: What initiatives encourage rural development across administrative boundaries? What policies and projects support this development? What are the benefits and challenges? In this light, this research seeks to contribute to cross-boundary rural development by enriching empirical studies of exploratory practices in China. It could also provide valuable insights for regions facing similar development challenges around the world.

Is the polycrisis finally leading to the privatization of risks? Evolving understandings of state responsibilities facing disasters in Italy.

Authors: Alessandro Coppola¹; Gloria Pessina¹

¹ DASTU, Politecnico di Milano

Corresponding Authors: gloria.pessina@polimi.it, alessandro.coppola@polimi.it

Drawing on studies by complexity theorists, sociologists, historians and political ecologists, the paper proposes a critical and evolutionary understanding (poly)crises (e.g. floods, fires, earthquakes, environmental contamination) at the intersection with socio-territorial inequalities in the global society of risk. Crises and disasters are hence critically analyzed in their socio-political and governance dimensions, considering how they are socially constructed, implying they exist only when certain actors declare and operationalize them as such. While crises are often approached as emergencies limited to specific events (disasters), our paper proposes to consider a wider time frame, looking at long-standing processes of unevenness in order to better understand punctual events. In this light, punctual events or key decisions related to disasters can become critical junctures within longer trajectories of crisis. Moreover, crises are new sources of territorialisation, both in term of actors' practices and state action. Given the (variably explicit) spatial dimension of (poly-)crises such as those related to floods, earthquakes, fires or epidemics, we propose to consider them as "territorial crises", investing multiple geographical scales and manifesting through practices of state-promoted redlining and zoning in response to emergencies. As shown by political economists and state theorists, "territorial crises" have been a privileged site for the deployment of state projects, understood as coherent templates 'within which individual agents and organs of the state can coordinate and judiciously combine (collibrate) policies and practices, and also connect diverse policies to pursue (a more or less illusory) national interest, public good, and social welfare' (Jessop 2016).

In previous studies the authors of the paper have been investigating "territorial crises" and the possibility to consider them as the site for the launch of new state projects, showing how specific actors within the state apparatus are granted extraordinary powers through the alteration of established multi-level inter-institutional arrangements, specific and evolving geographies for the implementation of state response are designated, and specific regimes of indemnisation are identified, thus defining broader rules of inclusion/exclusion. Today, the paper's authors are observing how the increasing frequency of extreme events and the growing complexity of polycrises have been exceeding the capacity of state actors to respond to them in multiple geographical contexts, from fire-ravaged Los Angeles to the repeatedly flood-hit Romagna region in Italy.

More in particular, more frequent and more damaging catastrophes are putting very intense pressure on the long-term financial sustainability of public, public-private, and private insurance systems across the globe. Such a new normal implies an increased risk of insurances insolvency and growing premiums for clients, or complete withdrawal from some territories and social groups, combined with the emergence of a “climate housing bubble” produced by the underestimation of the impact of risks on the value of properties. New socio-spatial cleavages result from these trends, confirming or re-shaping inherited geographies of risk and inequality. In Italy, where it has been the state to traditionally address post-disaster reconstruction financial needs, the more frequent pace and intensity of disasters is putting into question the sustainability of traditional forms of state intervention. In particular, the national government has recently advanced the idea of a compulsory insurance scheme for homeowners against all sorts of disasters – floods, earthquakes - to which the country is particularly prone. Such a proposal, soon withdrawn from the government, was put forward amid an unprecedented wave of floods that affected the area of Romagna, in the north-east of the country.

Based on this reasoning, and drawing from past and more contemporary cases, the paper presents a critical discussion of the evolving understandings of state responsibility facing disasters in Italy.

Values-driven development? Environmental regulation and planning for development in the UK

Author: Emma Street¹

Co-author: Victor Nicholls¹

¹ *University of Reading*

Corresponding Authors: e.j.street@reading.ac.uk, v.nicholls3@henley.reading.ac.uk

The planning project has always been perceived as *values-driven* as result of the profession's claimed ability to act in the Public Interest. Ethical matters have received significant scholarly attention and are enshrined in codes of practice such as professional charters. Yet, in countries such as the UK, the *modus operandi* of planning has changed profoundly in the last decade. Research shows many planning functions are now carried out by private sector professionals, raising important ethical questions. The business of development has also changed significantly, becoming more complex and, relatedly we argue, more overtly *values-driven*. Regulation is a key driver of this shift. Developers are now required to comply with a wide range of environmental standards, many of which sit within the increasingly complex planning system. Our research with regeneration and development practitioners since 2017 has shed critical light on development professionals' relationship with these regulatory requirements and how they relate to corporate - and personal - values. For instance, many professionals are engaging in agendas such as Social Value that go above and beyond 'minimum standards'. These stories further complicate the picture around the ethics and values that lie at the heart of planning for development in the UK today.

Participatory Community Planning and Collaborative Governance in the Post-Growth Era: A Case Study of the Nanning Love-U Garden Network in China

Author: luqiao zheng¹

Co-author: zichao xiong²

¹ Tongji University

² Shanghai Urbanspace Architectural Design Consultants Co., Ltd.

Many cities in the world today are facing the slowdown in economic growth, the reduction in fiscal revenue, and the resulting challenges in public space governance. With the slowdown in China's economic growth, urban construction has also entered the stock regeneration era from incremental development. Community planning and community regeneration based on the built environment require the engagement of multiple local actors and the collaborative governance of multiple departments. So, how can different collaborative governance models be used to stimulate community engagement for different types of communities? How can actors play the role of catalyst and driver in community collaboration and engagement? How to optimize the mechanism of participatory community planning and collaborative governance based on the existing institutional environment? However, current research mostly stays in macro-framework design and isolated case studies, lacking networked practice and continuous observation. Therefore, it is urgent to sort out the multiple models of collaborative governance and the optimization of participatory community planning mechanisms in combination with long-term systematic spatial practice.

The "Love-U Garden" action in Nanning, China, which began in 2021, has built a rare city-level garden network. Empowered and accompanied by social organizations, it encouraged residents to build and maintain spontaneously, innovated collaborative governance mechanisms, and ultimately became a model for the regeneration and gover-

nance of urban community green spaces. This study summarizes three co-construction models of participatory community planning and governance by analyzing the civic engagement and community actions in the whole process of this practice, each of which has its own applicability. The first is the professional-led model, which mainly relies on the leading demonstration and long-term empowerment of professional institutions. It is suitable for communities with both aging infrastructure and population, weak public participation foundation, and scarce social resources. The second is the multi-party co-construction model, which mainly relies on the collaboration and co-creation of external diverse social forces. It is suitable for communities with relatively rich social resources, diverse age structure, and strong participation potential. The third is the autonomous co-financing model, which mainly relies on the endogenous force of the community and the self-driving force of residents. It is suitable for communities with a good public engagement foundation, relatively complete infrastructure, and strong community self-organization ability.

This study proposes three optimization mechanisms for collaborative governance: First, adhere to the whole process to create a co-participation mechanism, and summarize three important KOLs: opinion leader type, brick-throwing type, and serial coordination type. Second, adopt a flexible joint cooperation and co-maintenance mechanism, and propose three maintenance forms: autonomous operation and maintenance by core actors, co-maintenance by the community of actors and property assistance, and property-led with actor-assisted. The third is to promote a differentiated fund-raising mechanism, and summarize four fund-raising models: government-led, multi-party, owner-raised, and seed fund. Finally, this study puts forward the following policy recommendations: First, the professional-led model should further promote the whole process civic engagement. Second, the multi-party co-construction model should actively link the engagement of all age groups. Third, the autonomous co-funding model should encourage multi-channel fund raising, such as introducing social forces to create inclusive projects.

In the face of the transformation of the community planning paradigm in the post-growth era, this study sorted out the multiple collaborative governance models to deal with the conflicts and dilemmas generated by different stages of public participation, and proposed flexible mechanisms and countermeasures. This study has certain reference significance for the construction of urban green space network in other cities around the world, the promotion of community collaborative governance, and the promotion of sustainable community development.

T_04 GOVERNANCE (O) / 1126**Zero Net Land Take Policy Mapping: A Multi-Level Analysis in the Context of Italy and Emilia-Romagna****Author:** Iuliia Kozlova¹**Co-authors:** Elisa Conticelli²; Serena Sgallari³¹ *University of Bologna*² *Department of Architecture, Alma Mater Studiorum, University of Bologna*³ *Regione Emilia Romagna***Corresponding Authors:** serena.sgallari@regione.emilia-romagna.it, iuliia.kozlova2@unibo.it, elisa.conticelli@unibo.it

The Zero Net Land Take (ZNLT) policy has emerged as a cornerstone of sustainable urban planning, aiming to balance urban development with land conservation by 2050. Rooted in the EU Soil Strategy for 2030 and the Biodiversity Strategy, these policies emphasize land protection and renaturalization but allow for variability in member state implementation. This study provides a comprehensive review of ZNLT-related policies across Europe, examining their adoption and adaptation at the European, national, and regional levels, with a focus on the Emilia-Romagna region in Italy as a case study.

The research involved an in-depth analysis of legislative documents, policy frameworks, and implementation guidelines. At the European level, overarching directives outline the primary goals and strategies, while national policies translate these into localized action plans. The study revealed diverse interpretations and implementations of ZNLT across member states, reflecting differing governance structures and spatial planning traditions. In Italy, the decentralization of spatial planning contributes to heterogeneous applications of ZNLT principles, with Emilia-Romagna standing out for its pioneering efforts. The region's Regional Law No. 24/2017 exemplifies a structured approach by capping new urbanization at 3% of the existing urbanized territory by 2050 and integrating ZNLT into spatial planning through measurable targets, incentives for land reuse, and robust monitoring mechanisms.

The analysis identified critical challenges to effective ZNLT implementation, including misalignments between European objectives and national or regional practices, fragmented policy action, and the absence of standardized metrics for monitoring progress. Insufficient economic and regulatory incentives at the subnational level further impede the prioritization of ZNLT goals. Stakeholder engagement remains inconsistent, reducing inclusivity and undermining land-use decision-making processes.

This study underscores the need for a coherent multi-level governance structure to achieve ZNLT objectives across Europe. By addressing policy gaps and fostering synergies, ZNLT can serve as a transformative framework for reducing land consumption, enhancing urban resilience, and protecting ecological systems. Emilia-Romagna's model offers valuable insights into aligning regional and local actions with national and European strategies, providing a replicable framework for other regions.

The proposed new spatial planning law in Italy: A critical reflection on its structure, content, and objectives in times of crisis

Authors: Pierpaolo Cicconi¹; Giorgio Caprari¹; Elio Trusiani¹

¹ School of Architecture and Design - SAAD, University of Camerino, Unicam

Corresponding Authors: pierpaolo.cicconi@unicam.it, giorgio.caprari@unicam.it, elio.trusiani@unicam.it

The paper presents a reflection on the proposed reform of the national urban planning law (Law 1150/1942), developed by the Italian National Institute of Urban Planning (INU, 2022) and titled 'Law of Fundamental Principles and General Rules for Land Governance and Planning'. This proposal is the result of a process initiated during the INU congress in 2022 to integrate contributions from the national debate, regional legislative innovations, and practical experiences gained across various territories. The proposed law seeks to provide the country with innovative general principles that serve as a shared framework for regional legislation, enabling a redefinition of land governance as a 'broad set of interacting functions'.

The fundamental principles, rooted in solid institutional collaboration, underscore: i) integrated territorial planning; ii) territorial equity and the inclusivity of urban systems; iii) public participation in planning processes; and iv) the imperative to preserve efficient territorial resources and unspoiled environmental assets for future generations. These principles embody new paradigms in planning, designed to confront contemporary climatic, environmental, social, and economic challenges.

Within this framework, the planning system is restructured using the method of interinstitutional co-planning—a collaborative and horizontal process guided by the principles of subsidiarity, adequacy, competence-based collaboration, and coherence. The planning system is divided into territorial planning and urban planning, each associated with distinct instruments. Territorial planning includes tools such as the Regional Landscape Plan (PPR), the Regional Territorial Plan (PTR), and the Metropolitan Strategic Plan (PSM). Urban planning introduces the General Urban Plan (PUG), which is already in effect and has been tested in some of the most innovative and forward-thinking regions. The PUG represents a significant innovation, fundamentally reshaping the national framework to align with the structure of planning instruments. It is arguably the most groundbreaking and experimentally challenging element, as it must integrate the contents of territorial planning tools (PPR, PTR, etc.) at the local scale. Additionally, it differentiates between structural-strategic, regulatory, and operational functions:

- The *structural-strategic function* translates the objectives and purposes of municipal land governance into terms of performance, quality, and impacts at the landscape, historical-cultural, economic, and social levels. It identifies and intervenes in both urbanized and agricultural areas, without granting building rights, but instead shaping choices and development forecasts. These are primarily focused on urban and territorial regeneration, land consumption containment, and the sustainability of urban transformations;
- The *regulatory function* pertains to areas of the territory not subject to urban transformations or complex urban regeneration. These include agricultural areas, natural spaces, and existing settlement and infrastructure systems, which are to be preserved, consolidated, and requalified through urban and building regulations. This component of the PUG assigns building rights and is implemented through direct interventions;
- The *operational function* addresses interventions and projects for complex urban and territorial regeneration, developed as an implementation of and in alignment with the structural-strategic component.

The paper, based on a critical and descriptive examination of the proposed law, aims to highlight key technical-disciplinary and conceptual issues related to its guiding principles, their implications for the redesign of the planning system and land governance, and the General Urban Plan with its tripartite function. Simultaneously, it reflects on ongoing regional experiences (e.g., Marche Regional Law No. 19 of November 30, 2023), based on the principles of the INU proposal. In doing so, it explores the 'open space of research' that lies between theoretical principles not yet in force and ongoing practical experiments.

Geographies of Carbon Trading: Spatial Planning Approaches for Equitable Offset Projects

Author: Cemre Betul Ay¹

Co-authors: Erblin Berisha ; Giancarlo Cotella

¹ *Student*

Corresponding Authors: giancarlo.cotella@polito.it, erblin.berisha@polito.it, iamcemreay@gmail.com

Carbon trading markets aim to balance greenhouse gas emissions of the countries by channeling climate finance from developed countries to developing ones by helping them mitigate climate change impacts and promote sustainable development. Carbon offsetting was introduced by the Kyoto Protocol, later expanded through market forces and United Nations' initiatives in a multi-layered structure spanning from supranational to local levels. However, the complex, multi-dimensional and multi-stakeholder nature of the mechanism poses challenges in the operationalisation processes that have been widely criticised for failing to address local needs and exacerbating environmental and social inequalities.

This research explores the ways spatial planning can enhance the operationalisation of carbon markets through policy design, community engagement, and land use management for delivering justice to the local communities with a lens to Uganda. Over the last 20 years, Uganda has become a hotspot for carbon offset projects due to its favorable bureaucratic processes influenced by its colonial legacy, and its conducive natural environment. To provide a comprehensive understanding of the carbon trading mechanisms' operationalisation, this study employs two different methodologies: firstly, the policy frameworks on environment and land use management are examined to understand the integration of carbon market projects, along with community engagement. Second, it uses desk research and interviews to analyze two contrasting case studies: the top-down Kachung Forest Project (KFP) of the Kyoto Protocol and the participatory Trees for Global Benefits (TGB) project of the voluntary carbon market. The KFP stands as an example of centralized governance in project management through top-down approaches that come from the supranational level and demonstrates its adverse impacts including displacement, lack of community involvement, and environmental degradation. On the other hand, the TGB illustrates the potential of grassroots activities and community-centred approaches to realise effective and efficient carbon offset projects, even though there are still some challenges to reaching long-term sustainability objectives. The findings of this research show that well-designed policies, inclusive management and equitable resource distribution are essential for the carbon offset projects' success through the experiences of Uganda.

Taken the lessons from the Uganda experiences, this research aims to identify the pathways to address environmental and social inequalities occurs in the carbon trading projects by integrating spatial planning tools and emphasising participatory governance to enhance the equity and effectiveness of carbon offset initiatives to enhance justice on the global level.

Pursuing climate neutrality through ecosystem services: Evidence from Campania Region, Italy

Authors: Corrado Zoppi¹; Federica Isola¹; Federica Leone¹; Francesca Leccis¹

¹ *University of Cagliari, Italy*

Corresponding Authors: zoppi@unica.it, francescaleccis@unica.it, federica.isola@unica.it, federicaleone@unica.it

In this study, a methodological approach that aims to implement climate neutrality through spatial planning policies is defined and applied. The measure of carbon sequestration (CS) is taken as a reference to estimate the status and evolutionary dynamics of this phenomenon, analyzed and evaluated as associated with the supply of certain types of ecosystem services (ESs), in relation to the reference spatial context. The study is developed as follows. First, the spatial framework of CS is characterized through density maps, utilizing the “Carbon Storage and Sequestration” model of the InVEST suite, which estimates the amount of carbon stored in reference spatial units using raster maps of land cover (Liquete et al., 2015). The model estimates the state of CS, allowing, also, to appreciate its variation over time (Sun et al., 2019). The spatial context addressed by the implementation of the methodology is Campania, an administrative region in southern Italy.

Second, a methodology for characterizing the supply of ESs is identified. The multifunctionality of the supply of ESs can be considered as an analytical reference for the definition of a system of measures oriented to the improvement of CS capacity and, therefore, of the contribution of local spatial planning policies to the effective pursuit of global climate neutrality. Based on previous studies (Isola et al., 2022) and in-depth analyses of environmental, landscape, and socio-cultural contexts, the provision of ESs in relation to the regional territory of Campania is characterized in this study by the following types: preservation of habitat quality levels suitable for sustaining the life cycles of plants and wildlife that can be useful to humans; climate regulation through mitigation of land surface temperature; production of agricultural crops and timber; protection and enhancement of the attractiveness of spatial contexts in relation to nature- and natural resource-based recreational and cultural activities (Zulian et al., 2014); preservation and enhancement of landscape values that ground regional identity.

Finally, the correlations between the spatial taxonomies of CS capacity and ESs supply with regard to the Campania regional context are detected and analyzed, in order to assess how the characteristics and specificities of the multifunctional ESs supply can be effectively used in order to maximize CS capacity, and, thus, the contribution of the Campania region to the improvement of global climate neutrality. The identification of these correlations allows, also, to identify specific recommendations in terms of plan policies in order to improve the quality of life of local societies in Campania.

Optimizing Carbon-Neutral Campus Renewal: A Case Study of Xi'an East Station Hub Core Area

Author: Ting Yang¹

Co-author: Antti Ahlava²

¹ *Tongji University*

² *Aalto University*

Corresponding Authors: antti.ahlava@aalto.fi, 11847148@qq.com

The dual challenges of climate change and environmental degradation place immense pressure on urban environments, making it critical to integrate carbon-neutral strategies into the early stages of planning and design. This study focuses on campus renewal, using the Xi'an East Station Hub Core Area as a pilot to explore innovative approaches for low-carbon, climate-resilient urban design. By leveraging intelligent evaluation platforms, nature-based solutions, and participatory governance structures, this research aims to establish scalable pathways for sustainable urban renewal.

Through the Urban Planning and Design Carbon Neutrality Intelligent Evaluation Platform, real-time assessments of carbon emissions and sinks were conducted, revealing a substantial gap of 100,000 tons CO₂ to achieve carbon neutrality. This shortfall was addressed through a multi-faceted approach combining renewable energy technologies, such as solar panels and ground-source heat pumps, with enhanced green infrastructure and industrial transformation. For example, three-dimensional greening and ecological corridors added 4,100 tons of carbon absorption, while converting 38% of high-density commercial areas into biopharmaceutical clusters reduced emissions by 30,000 tons. These interventions demonstrate how intelligent planning can dynamically balance carbon sources and sinks.

This case study contributes to the broader theoretical understanding of carbon-neutral urban renewal by situating campus-focused solutions within the context of urban ecological transformation. It underscores the importance of aligning technological innovation with participatory governance to address the complexity of urban climate challenges. By integrating advanced data-driven methodologies and human-machine collaboration, this research provides a replicable framework for designing inclusive and resilient campuses.

This research addresses critical themes of climate mitigation, adaptation, and environmental justice. It highlights the role of campuses as experimental spaces for testing innovative planning strategies, emphasizing renewable energy integration, ecosystem restoration, and equitable decision-making. The study also contributes to governance discussions by showcasing how multi-stakeholder collaboration and dynamic planning processes can support long-term sustainability goals.

In conclusion, the Xi'an East Station Hub Core Area exemplifies how campuses can lead the way in addressing global environmental challenges. By combining cutting-edge technology with inclusive urban strategies, this research offers actionable insights for policymakers and planners aiming to create low-carbon, climate-resilient futures.

Between Walls and Water: Stormwater infrastructure, everyday adaptation, and the quest for environmental justice in Mumbai

Author: Lekha Samant¹

¹ *University of Amsterdam*

Corresponding Author: l.s.samant@uva.nl

The way in which urban planning deals with the question of land in Mumbai is invariably tied to how it imagines urban water—in its various forms and flows—in relation to land. In a city where land-use planning is dominated by real estate imperatives, the everyday life of Mumbai's inhabitants is caught in the struggle to anticipate and adapt to how water will flow and flood the city, altering and affecting their socio-spatial experiences, particularly during the monsoon every year. This paper attempts to understand how infrastructural planning practices for storm water drainage shape everyday spatial experiences in the city, focussing on water-related 'events' such as floods, landslides and infrastructural collapses. Through an in-depth case study, the paper investigates into the event of the infrastructural wall collapse that took place in Malad, Mumbai during the monsoon of 2019. It uses the extended case study method to historicise and expand the findings of the wall collapse event for tracing the evolution of storm water infrastructure and drainage in Mumbai's planning. By conducting a transect study of the Malad wall collapse site and situating it within a broader geographical and political-economic context of the city-region, the paper explores the relation between everyday adaptive practices of vulnerable residents and the environmental transformations brought about by regional planning. It develops the transect as an 'analytical tool', grounded in a political ecology framework, to uncover the linkages between everyday adaptation practices and the multi-scalar visions of infrastructural planning that have reconfigured land-water relations in the city-region over time. The paper argues that everyday adaptation practices emerge as a critical response to the inadequacies of institutional planning in addressing storm water management, revealing the intersection of local and regional planning

processes. It theorises the ‘everyday’ as a site where planning failures and environmental injustices are negotiated, highlighting the historical spatial inequalities and systemic vulnerabilities that exacerbate water-related disasters in cities of the global South. It underscores the urgency of addressing environmental and climate justice within the framework of everyday adaptation practices and calls for reimagining institutional planning by prioritising the needs of marginalised communities in cities of the global South.

Communities facing floods: risk awareness and climate adaptation strategies in Polish mountains

Author: Sylwia Dołzbłasz¹

Co-author: Anna Grochowska¹

¹ *University of Wrocław*

Corresponding Authors: sylwia.dolzbłasz@uwr.edu.pl, anna.grochowska@uwr.edu.pl

The ongoing impacts of climate change have led to an increase in the frequency and intensity of extreme weather events, such as floods, which pose significant threats to local communities, infrastructure, and ecosystems. In response to these challenges, this research examines flood risk awareness among residents and evaluates the effectiveness of authorities' actions during flood crises. Conducted in the Kłodzko Valley - a region heavily affected by intense rainfall and flooding in 2024 - the study provides unique insights into social needs and barriers in crisis management.

The study employs qualitative interviews conducted shortly after flood events, capturing

authentic emotions, experiences, and evaluations from residents. The results reveal critical gaps in warning systems and risk communication, emphasizing the need to integrate community perspectives into adaptation strategies. The analysis also underscores the importance of environmental education and building trust between communities and authorities to enhance the effectiveness of preventive and adaptive measures. The findings offer concrete recommendations for spatial planning and crisis management in the context of climate change. Proposed strategies, such as tailored educational initiatives, strengthened local warning systems, and greater transparency in authorities' actions, aim to increase community resilience to future climate-related threats. This research significantly contributes to the advancement of knowledge and practices in risk management under the dynamic challenges posed by a changing environment.

Adapting urban coastlines: strategies and open questions from European regions

Author: Vittore Negretto¹

¹ *Iuav University of Venice*

Corresponding Author: vnegretto@iuav.it

In addressing the impacts and consequences of climate change, there is often a socio-political narrative—particularly at the local level—that focuses on immediate responses and short-term futures. This narrative prioritizes the restoration or maintenance of the pre-event status quo, driven by the desires of affected populations and economic stakeholders, as well as the alignment with political cycles and electoral interests. Incremental adaptation and reconstruction are the most frequently advocated approaches, especially following sudden, high-intensity shock events. However, this conservative tendency is even more pronounced when dealing with slow-onset stresses, where the short-term horizon dominates. In this context, protection measures, emergency responses, and incremental adaptations are the most implemented, often overshadowing transformative opportunities that challenge the current paradigms of coexistence between coasts, their uses, and communities. Despite the existence of transformative windows of opportunity to address impacts with a long-term perspective, they remain underexplored and underutilized.

This contribute examines the adaptation strategies employed in low-lying urban coastal regions to address the challenges posed by climate change, including rising sea levels, storm surges, and coastal erosion. By analyzing current practices, the research identifies key principles and strategies applied in coastal adaptation, referencing the four main approaches outlined by the IPCC (2022): accommodation, planned retreat, strategic expansion, and protection. These strategies vary in their transformative potential, from enhancing existing infrastructure to coexisting with water, to relocating vulnerable communities, creating new land, or building robust coastal defences.

While incremental measures appear to dominate coastal management practices, transformative approaches such as planned retreats seem to face significant political and economic barriers. There appears to be a persistent tension between the prioritization of short-term protective strategies and the pursuit of long-term sustainability for coastal ecosystems. Exploring how local and national adaptation strategies can be better aligned may be key to fostering more effective and forward-looking responses to escalating climate risks.

However, critical questions remain: how can local decision-makers be encouraged to consider transformative approaches such as managed retreats? What are the socio-economic trade-offs associated with prioritizing protection versus accommodating natural processes? And how can coastal cities balance immediate needs with the long-term resilience of their landscapes? These questions are vital to shaping the future of coastal adaptation in the face of accelerating climate impacts.

Through Children's Eyes: Exploring Climate Change and Flood Resilience in Indonesia's Coastal Areas

Author: Intan Hapsari Surya Putri¹

Co-authors: Wiwandari Handayani²; Amy Young³

¹ 1. Diponegoro University, Indonesia; 2. National Research and Innovation Agency, Indonesia

² Diponegoro University, Indonesia

Children are among the most affected yet least involved groups in urban flood resilience planning, particularly in coastal areas facing increasing risks due to climate change. In Indonesia, cities like Semarang, Jakarta, Demak, and Pekalongan are at the forefront of these challenges. Many children in these areas live in informal settlements where frequent flooding disrupts their daily lives. Beyond interruptions to education and family dynamics, some children are forced to join the workforce to support their families, highlighting the complex socio-economic impacts of climate change on this vulnerable group.

This study serves as a preliminary exploration of children's experiences, perspectives, and potential roles in flood resilience planning. Drawing on data from a representative sample of children across four coastal cities, the research provides insights into the multifaceted ways climate change affects their lives. Flooding has been identified as a major disruptor, leading to school closures, heightened mental stress, and strained family relationships. Children also reported challenges in accessing clean water and sanitation during flood events, which further exacerbates health issues.

The study also investigates children's awareness of climate change, their understanding of flood risks, and their views on solutions. While some demonstrate a basic understanding of climate-related challenges, their access to information and opportunities to contribute to mitigation efforts remain significantly limited. This exclusion leaves a critical gap in flood resilience planning, as children's unique perspectives and resilience strategies are often overlooked.

In response to these findings, this paper advocates for actionable interventions to integrate children's voices into urban resilience planning. Recommendations include establishing platforms for youth participation in community decision-making, integrating climate education into school curricula, and fostering intergenerational collaboration to align community priorities with children's needs. Additionally, policies should address the socio-economic vulnerabilities faced by children in informal settlements, ensuring

access to education and safeguarding their well-being during climate-induced disruptions.

By amplifying children's voices and recognizing their potential as agents of change, this study underscores the necessity of inclusive approaches to flood resilience planning. Although preliminary, the findings provide a foundation for further research and advocacy to better integrate children into climate adaptation strategies, ultimately supporting the development of more equitable and sustainable coastal urban communities in Indonesia.

Temporal-Spatial Distribution Characteristics of PM_{2.5} and Noise in the Under-Viaducts Space

Authors: Siying Li¹; Zeyin Chen²

¹ *Tsinghua University*

² *Tongji University*

Corresponding Authors: 335836932@qq.com, lsy_catnip@163.com

As large cities grow in size and density, they come under increasing pressure for space. Many under-viaducts spaces (UVSs) are being converted into open-air sports fields, but such spaces can cause air and noise problems for people playing sports. There is a lack of research on the pollution of the UVS. In order to finely analyse the environmental pollution in the UVS, the article takes an open-air sports ground under a bridge in Shanghai as an example, and collects PM_{2.5} concentration, noise sound level, temperature and humidity, and traffic flow by using mobile monitoring equipment such as PM:SidePak Aerosol Monitor AM520 and AWA6228 multifunctional sound level meter. The spatial and temporal distribution of PM_{2.5} and noise in winter in the UVS was investigated using descriptive statistics, spatial interpolation and visualisation. The results show that: (1) PM_{2.5} concentration and noise values at different times and points in the space under the bridge are higher than the baseline values, the spatial and temporal distribution of PM_{2.5} concentration fluctuates significantly, regional air pollution amplifies the relative exposure concentration of PM_{2.5}, and the spatial and temporal distribution characteristics of noise are more stable; (2) the daily type difference of PM_{2.5} is greater than the time period difference, while the noise time period difference is greater than the daily type difference, and both of them are nearly arterial roads are elevated and near water bodies are reduced; (3) the air quality pollution intervals at the monitoring points account for 58.0%, and the Grade 5 sound environment intervals account for 95.5%, so the air and sound environments are poor, and the suitability of activities in the space under the bridge is low; (4) Air pollution is highly correlated with the built environment and traffic flow, while noise is more closely related to traffic flow and less so to the built environment, both of which have a negative correlation with temperature. This study provided valuable empirical evidence on the exposure to air and noise pollution in the sports space under viaduct in the micro-environment, which can help planners to adequately consider pollution reduction in the planning and management of urban renewal.

An Examination of the Environmental Impacts of Mega Projects on Rural Areas: A Case Study of Two Villages in the South Marmara Region of Türkiye.

Author: Beyzanur Uzun^{None}

Co-author: Gökçen Kılınç Ürkmez

Corresponding Authors: gokcen.kilinc@btu.edu.tr, 22435007030@btu.edu.tr

Mega projects, including large-scale industrial zones, bridges, airports, and transportation infrastructure, represent significant investments that profoundly alter land use patterns and pose substantial risks to ecosystems. Within the context of the United Nations' Sustainable Development Goals, particularly those addressing "life on land" and "climate action," the social and environmental ramifications of these projects often extend beyond economic and regional development considerations. While substantial research has been conducted on the effects of mega projects on urban areas, their impacts on rural regions and communities tend to be more profound and destructive.

Environmental Impact Assessment (EIA) serves as a critical mechanism for evaluating the environmental consequences of such projects. Although EIA processes have been legally implemented in Turkey since the 1990s, they have often proven insufficient in mitigating environmental damage.

Mega projects are primarily concentrated in the Marmara Region of Turkey, encompassing a series of investments collectively referred to as the "Golden Ring." This initiative aims to establish a transportation corridor enabling travel across the entire Marmara Region within four hours, thereby facilitating the decentralization of industrial activities. Within this context, the provinces of Bursa and Yalova occupy a pivotal position as key junctions in the Southern Marmara region. These provinces possess unique natural assets, ecological diversity, and rural settlements, which necessitate careful evaluation from a sustainability perspective.

In this context, this study focuses on assessing the environmental impacts of mega projects on rural areas, with specific reference to Kılıç Village in Yalova (Çiftlikköy) and Taşpınar Village in Bursa (Karacabey). Both villages are strategically situated at the intersection of major regional investments. Kılıç Village is located along the Istanbul-İzmir Highway and within the borders of the Yalova Machinery Specialized Organized Industrial Zone, while Taşpınar Village lies within the Technological Organized Industrial Zone (TEKNOSAB). Notably, Taşpınar Village is also situated near Lake Uluabat, a Ramsar-protected wetland of international significance. Both villages are characterized by high-quality agricultural production and rich ecological resources, which heighten their vulnerability to environmental degradation.

A mixed-methods approach will be employed in this study, incorporating both qualitative and quantitative data. Qualitative methods will include a review of relevant literature, institutional perspectives, and interviews, while quantitative methods will involve the analysis and mapping of data on population, industry, trade, and transportation.

The study also aims to provide a comprehensive understanding of the transformation processes experienced by rural areas such as Bursa and Yalova over the past decade due to the implementation of mega projects. It will also examine the potential future impacts of these transformations. By highlighting the risks associated with prioritizing economic development at the expense of environmental sustainability, this research seeks to serve as a warning and a guide for mitigating the adverse effects on rural communities. Furthermore, the findings are expected to inform strategies for safeguarding ecological balance and rural identity before critical environmental and social thresholds are surpassed.

Linking outdoor particulate pollution to children's negative experiences of their neighborhoods: Findings from an interdisciplinary research project in Ankara

Author: Yucel Severcan¹

Co-authors: Neşe Aydın ²; Özlem Özden Üzmez ³; Eftade Gaga ³; Aybuke Coban ¹; Gonenc Ozarli ³; Göksun Yıldırım ¹

¹ *Department of City and Regional Planning, Middle East Technical University*

² *Department of City and Regional Planning, Süleyman Demirel University*

³ *Department of Environmental Engineering, Eskisehir Technical University*

Corresponding Authors: gonencozarli@ogr.eskisehir.edu.tr, egaga@eskisehir.edu.tr, yucelcan@metu.edu.tr, goksun@metu.edu.tr, oozen@eskisehir.edu.tr, neseaydin@sdu.edu.tr, ay-coban@metu.edu.tr

Past studies have raised concerns about the vulnerability of children to air pollution because of the characteristics of the places where they live and go to school (Chaix et al., 2006; König, 2024; Lim et al., 2017). Alongside these concerns, the past few decades have witnessed a substantial amount of research aimed at (i) understanding the factors associated with outdoor air pollution in children's neighborhood environments (Paciencia et al., 2022), and (ii) the negative place experiences of children in their neighborhoods, including of those related to outdoor air quality (Ozbil et al., 2024). However, to the best of our knowledge, no study has ever brought these two research topics together. The authors argue that, in the absence of experimental studies on the effects of air pollution on children's relationship with their environments, a match between low levels of neighborhood air pollution and a few negative outdoor experiences related to air quality can support the claims of researchers that there is a relationship between outdoor air pollution and outdoor place experiences of children (Börner et al., 2017).

This study aimed to (i) understand whether children report more negative experiences about outdoor air pollution in school neighborhoods with higher PM2.5 and PM10 concentrations, and (ii) whether these air pollution-related issues are related with the built environment characteristics of their neighborhoods. To respond these questions, an interdisciplinary research project was conducted between 2020 and 2024. The method consisted of several steps. First, eight neighborhoods were selected from Ankara, Türkiye. All public elementary and middle schools were selected from these neighborhoods. Thereafter, all children aged 9 to 14 years in these selected schools were asked to attend a participatory mapping activity. From 16 schools, 1687 children took part in this activity of the project where they pinpointed the negative places around their schools and discussed the reasons of their dissatisfaction with these settings. Meanwhile, built environment characteristics of children's school neighborhoods (e.g., street connectivity, building density, land use mix, neighborhood greenness, proximity to forests, proximity to industrial sites) were collected and objectively analyzed using ArcGIS. In the further stages of the study, PM2.5 and PM10 measurements were conducted in approximately 20 different locations in each school neighborhood by using DustTrak II 8530 aerosol monitors. The measurements took place twice, one in a heating and another in a non-heating season. Children's comments about their experiences of their environments were coded in a content analysis software, MaxQDA, and compared under clusters of school neighborhoods each of which represented different

characteristics based on their location (inner city and periphery) and neighborhood greenness.

Our key findings show that, in overall, children referred to nine different themes associated with air pollution issues when explaining the reasons of their dissatisfaction with different places in their school neighborhoods (e.g., presence of places that lack trees and other vegetation, places where there are construction activities, and places where people are smoking). However, the frequency and percentage distribution of these themes varied from one cluster of school neighborhood to another along with a change in the built environment characteristics and average PM_{2.5} and PM₁₀ concentrations of these environments. These results provide valuable insights for urban planners and designers, highlighting the importance of experiential and context-specific built environment factors related to particulate pollution and offering a foundation for informed decision-making in creating healthier neighborhoods for children.

Uses and limitations of community participation tools and strategies to create positive energy districts: A literature review

Authors: Alper AL^{None}; Ceren Sezer^{None}

Corresponding Authors: sezer@staedtebau.rwth-aachen.de, alper.al@staedtebau.rwth-aachen.de

The transition to clean energy systems is key to meeting carbon neutralisation targets. Positive Energy Districts (PEDs) emerged to promote local energy autonomy and flexibility. PEDs present an energy transition roadmap multifaceted with social, spatial, and technical aspects. Social aspects include the identification of stakeholders and initiating community collaboration. Establishing energy communities addresses inequalities of energy and mobility poverty by providing access to clean and reliable services. Spatial

factors involve the assessment of feasible areas for implementing positive energy infrastructure. The implementation of active systems for energy generation, low-carbon mobility options, and strategies to reduce energy consumption are technical components. Although there is a roadmap for establishing PEDs, lack of public interest, resistance to change, high costs, and lack of participatory processes prevail as challenges.

Community participation approaches are essential to achieve PEDs. Hewitt et al. (2020) put forward participatory tools are more common to support the implementation of environmental policies in many fields but are less common in the energy field. Participation involves the co-creation of energy, mobility, and climate comfort scenarios, co-monitoring of energy use, and shared governance to tailor energy goals. This has the potential to enhance social acceptance as well as develop a user-centered approach to technologies. Given the diverse disciplines involving the built environment, it is essential to identify the obstacles and opportunities of PED in an inclusive and participatory way.

This paper presents a bibliometric review that aims to explore the potential uses of digital participatory processes in energy transition initiatives. Bibliometric analysis is useful for detecting key publications and mapping research fields (Passas, 2024). The publications queried using digital, *urban design*, participation, and *citizen engagement* keywords. Keywords are chosen based on key research themes including synonyms and related concepts. The queries from databases have resulted in 565 publications. A total of 127 duplicates and 20 publications with different fields were eliminated. 418 publications obtained at this stage were uploaded to Bibliometrix software to conduct author, citation, and impact analysis. The most relevant 50 articles are detected using bibliometric analysis based on the author's local and global impact and the most relevant authors based on co-occurrence and co-citation analysis. This was followed by the snowballing technique to enhance the scope of the review, and 12 more articles were added. In the end, a total of 62 articles are examined for the literature review.

The literature review presents the advantages and limitations of digital participatory tools for establishing PEDs. Digital tools are effective in disseminating information and reaching more people in a limited time. New visualizations provided by virtual technologies can support energy transition projects by enhancing communication (Spieker, 2018). The findings suggest that digital participatory approaches can be integrated into processes as communication channels to evaluate alternatives (Spieker, 2018). Wilson et al. (2024) emphasize developing long-term trust between stakeholders using digital and analog methodologies. However, relying on a single tool to fulfill expectations on energy transition poses limitations. Although hybrid models offer bottom-up participation, digital literacy barriers, maintaining interest, and managing the alignment of views are challenging (Chaves et al., 2021). Wilson et al. (2024) refer to the capabilities of tools in terms of time, interaction, communication, and learning processes. This review paper concludes by suggesting exploring the potential of hybrid methodologies incorporating digital and analog tools in energy transition projects. The integration of social, spatial, and technical aspects would inform experts working in different fields and encourage the integration of human-centered approaches and evidence-based strategies. The direction of future research emphasizes a need for applying hybrid methodologies to address time and space constraints, level of participation, and integration of tools.

Simulsoil: Sustainability-Oriented Soil Planning and Management in Turin's Metropolitan Area

Author: Carolina GIAIMO¹

Co-authors: Giulio Gabriele Pantaloni ¹; Federico Farina ¹; Andrea Nino ¹

¹ *Politecnico di Torino, DIST - Interuniversity Department of Regional and Urban Studies and Planning*

Corresponding Authors: andrea.nino@polito.it, carolina.giaino@polito.it, federico_farina@polito.it, giulio.pantaloni@polito.it

Mountain areas represent a key domain where scientific literature recognizes emerging cultural and settlement trends that attribute centrality to mountains as privileged sites for experimenting with alternative lifestyles, in contrast to those commonly characterizing lowland urban contexts (Dematteis, 2020). Moreover, at the European level, mountains have been acknowledged for their economic, environmental, energy, and cultural significance, serving as water reservoirs, sources of renewable energy, major tourism hubs, and repositories of biodiversity. At the same time, their vulnerabilities linked to climate change and its cascading effects on broader territorial contexts have also been highlighted.

These dynamics threaten the proper exchange of flows and services, including **Ecosystem Services (ES)**, originating in mountain areas and providing substantial benefits to lowland territories. Numerous studies and research initiatives have applied the ES paradigm to spatially represent ecological and environmental characteristics, supporting territorial governance processes and addressing contemporary challenges related to climate change. This raises the critical question of the appropriate scale at which ES should be assessed: ecosystem performance depends on spatial configurations that identify both service-providing and beneficiary areas (Corrado et al., 2019).

The paper examines the case of the **Metropolitan City of Turin (CmTo)** in the Piedmont Region (Italy), where mountain areas account for 53% of the territory and host 23% of its 312 municipalities. This context is part of an Alpine **metro-mountain system**, where economic, social, and cultural dynamics are shaped by mountain-lowland interactions (Dematteis, 2018).

Building on these premises, the study presents the results of an ES analysis in the CmTo area, aiming to assess the relationships and flows between mountain and lowland areas and highlight the role of high-altitude territories in the broader metropolitan system of reciprocal interactions.

This application is based on the latest scientific knowledge regarding soil ecological functions, drawing on findings from the **EU Life SAM4CP Project (2014–2018)** (1). The project, developed by CmTo in collaboration with DIST-Politecnico di Torino, ISPRA, CREA, and CSI Piemonte (Giaino & Barbieri, 2018; Giaino, Barbieri & Salata, 2019), received formal recognition from the European Commission for its results, particularly for the use of the **open-source plugin Simulsoil**.

Currently under revision (2), Simulsoil is being updated to better support metropolitan land-use planning and soil consumption monitoring. This study leverages soil analysis methodologies using the *Habitat Quality* and *Carbon Storage and Sequestration* statistical

models embedded in Simulsoil.

The findings underscore the crucial role of ES analysis as an integrated tool for supporting spatial planning processes at the territorial and municipal level.

Social Movements and Collective Climate Adaptation: The Case of Campo do Bomba, Duque de Caxias-RJ

Author: Ana Lucia Britto¹

Co-authors: Jorge Fleury Fonseca¹; Thêmis Aragão¹

¹ PROURB - UFRJ

Corresponding Authors: themisaragao@gmail.com, jorgefleury@gmail.com, anabrittoster@gmail.com

Addressing climate governance in Brazil presents a significant challenge due to institutional and political barriers that hinder the implementation of adaptation projects. These challenges include a lack of institutional capacity at the local level and difficulties in integrating sectoral policies. In the Rio de Janeiro Metropolitan Area (RJMA), which comprises 22 municipalities, only two have a Climate Change Mitigation and Adaptation Plan. Despite the absence of official policies or plans for adapting to climate change, local social movements have taken the lead, advocating for better housing conditions and environmental preservation. This article analyzes social mobilization for environmental protection and climate change adaptation through a case study in Duque de Caxias, one

of the RJMA municipalities, showcasing a community-driven project to prevent floods—an essential aspect of climate change adaptation.

Duque de Caxias features a terrain of plains with rugged hills and steep slopes. Its major river basins are characterized by torrents on the slopes that become depositional on the plains, resulting in floods during heavy rains. The municipality struggles with outdated urban planning—its 2006 master plan remains unchanged—and uncontrolled urban occupation of environmentally fragile areas. Although laws prohibit real estate development in these areas, informal settlements often emerge due to the lack of social housing policies that meet the needs of low-income families. The combination of informal occupation in riverbanks and increasingly intense rainfall exacerbates the frequency of flooding episodes.

Duque de Caxias does not have a climate change adaptation plan. As noted by Wannewitz and Garschagen (2023), adapting to climate change is an increasing challenge for local communities, particularly in areas with limited formal adaptation policies, such as marginalized informal settlements. The authors argue that successful adaptation requires collaborative efforts, known as collaborative adaptation. In Duque de Caxias, local social movements advocating for environmental and housing rights have begun addressing climate change issues, embodying the principles of collaborative adaptation.

One of the primary focuses of these movements is the preservation of Campo do Bomba. This area was originally part of the São Bento Protected Area (APA São Bento), created in 1997 due to its ecological importance and role in flood regulation. However, in 2006, the municipal government removed Campo do Bomba from the protected area. In 2018, the mayor proposed a project for a logistics center in this still unoccupied area. In response, FORAS, a civil society organization comprising various social movements from Duque de Caxias, spearheaded resistance against the project.

FORAS organized three public hearings, bringing together residents, social movements, state deputies, and researchers to oppose the project. They also hosted online seminars with researchers and community members to explore alternatives that would preserve the area's ecological value. A consensus emerged to propose the creation of a state park. This initiative culminated in a state bill proposal supported by multiple state deputies.

In collaboration with FORAS, a group of scholars from the Federal University of Rio de Janeiro developed a “sponge park” project for the Campo do Bomba area, combining scientific research with community-based solutions. The proposal was discussed in several meetings with residents. Local leaders have worked to disseminate the project via social media and present it to public officials. The state government's environmental agency endorsed the project as a viable solution to the area's flooding problems and a potential leisure space for the population.

This case study highlights the potential of collective adaptation, driven by civil society, to strengthen local climate change adaptation efforts

Analyzing heat-related health risks on a local level: Results

from a household survey in Dresden and Frankfurt/Main, Germany

Author: Jasmin Uttner¹

Co-author: Alexandra Weitkamp¹

¹ TU Dresden | *Professorship of Land Management*

Corresponding Authors: alexandra.weitkamp@tu-dresden.de, jasmin.uttner@tu-dresden.de

The multiple impacts of climate change, such as floods, heavy rainfall, and heat waves, pose major challenges to cities and their inhabitants. In order to protect urban residents from these threats implementing targeted adaptation measures is essential especially in particularly affected areas and for vulnerable groups. In this context, assessing heat-related health risks is extremely challenging and complex, as it involves understanding and considering three dimensions: hazard, exposure, and vulnerability. Integrated approaches assessing all these dimensions are rare due to the lack of small-scale and subjective data.

To address the gap in local data on heat perception and behavior, an online household survey was conducted in early September 2024 as part of a PhD-project. This study addresses two key questions and takes a closer look at two case studies, Dresden and Frankfurt am Main, in Germany:

1. Which population groups are most affected by urban heat?
2. Where in the city and in which everyday situations, such as living, working and mobility, are adaptation measures most needed?

The survey focused on six districts that were selected based on a GIS analysis of the cities' heat maps and are particularly hot. The sample households were randomly selected through the distribution of flyers to mailboxes. To ensure a high participation, the survey is available in the five most common languages of the districts (German, English, Arabic, Turkish and Russian) and focuses on heat perception, behavior during heat waves, exposure and adaptation strategies in various everyday situations (housing, work, public transport), and socio-demographic characteristics.

The results based on a statistical analysis show significant differences in heat perception between the cities, everyday situations, and socio-demographic groups (the p-value is set to 5% or less). In both cities, the perception of heat stress is highest when walking in the city center and when using public transport. Compared to other situations with lower average ranks (e.g. at home during the day, at work, or when walking in the immediate residential area), these differences in distribution are statistically significant for both cities. Furthermore, heat perception on public transport differs significantly between the two cities, being higher in Dresden than in Frankfurt/Main. No other significant deviations in heat perception in general or during other everyday situations can be detected between the cities and districts.

A closer look at the socio-demographic groups reveals some significant differences: In both cities, women report higher levels of heat stress than men when walking in the city center and in the immediate residential area. In Dresden, this is also true for public transport and at work. Health status also influences heat perception, especially in Dresden, where people with lower health status experience significantly higher heat stress in general, at home, when walking outside and on public transport. In Frankfurt/Main, this is only reported when walking in the neighborhood. Singles without children in Dresden perceive less heat than couples with children when walking in the immediate neighborhood and in the city center. In addition, individuals living on the top floor in Dresden are significantly more affected by heat at home during the day and at night than those who live on the ground floor. No such differences can be found in Frankfurt/Main.

In conclusion, the findings highlight the urgent need for spatially and socially differentiated adaptation strategies in the districts of Dresden and Frankfurt/Main. Further steps will include qualitative interviews with experts and local stakeholders to validate the results and gain a more comprehensive understanding of heat stress at the local level. This

knowledge is necessary to develop targeted strategies for adaptation to climate change in the two cities.

Addressing Climate Equity Through Community Engagement on Virginia's Eastern Shore

Author: Ozlem Edizel Tasci¹

¹ *Senior Associate & Proposal Writer, UVA*

Corresponding Author: umk4dz@virginia.edu

Rural coastal communities are highly dependent on natural resources, making them particularly vulnerable to the impacts of climate change. This is especially evident in the Eastern Shore of Virginia (ESVA), a hotspot for accelerated climate impacts, including rising sea levels, coastal and inland flooding, and groundwater salinization. These environmental pressures threaten local agriculture, infrastructure, and community livelihoods, particularly in rural and underserved regions. Exacerbating these issues are social and geographical isolation, limited access to scientific information, and the fragmented nature of local decision-making, which often prioritizes short-term solutions over sustainable, equitable adaptation strategies.

To address these challenges, the ESVA Climate Equity Project, funded by the U.S. National Science Foundation's Coastline and People (CoPe) program, has developed a participatory engagement framework that integrates local knowledge with scientific research to build community-driven climate resilience strategies.

Community engagement is foundational to this work, with activities designed to center diverse voices, particularly those from historically underserved populations. A 12-member Community Advisory Committee (CAC), inclusive of local leaders, guides the project. Broader outreach strategies—such as workshops, interviews, and focus groups—ensure inclusive participation, amplifying community concerns and integrating lived experiences into tool development. These efforts have deepened local understanding of climate risks and fostered trust, enabling effective collaboration between stakeholders.

This paper explores the outcomes of the ESVA Climate Equity Workshops and institutional stakeholder interviews. The workshops adopt an open-house format to foster dialogue between the scientific community and local stakeholders. With participation from 60-80 community members per event, the workshops cover critical topics such as sea-level rise, septic system management, and the regional climate timeline. A key outcome has been the identification of community desires for deeper, more sustained conversations about climate solutions. By employing interactive tools and tailored presentations, the workshops serve as a platform for amplifying diverse voices and addressing localized climate impacts. The institutional interviews with community organizations and service providers highlight their perspectives on the challenges, needs, and opportunities associated with climate equity and resilience. These insights provide a detailed look at the region's climate priorities, including water management, sea-level rise, housing, infrastructure, public health, and more.

Key findings reveal that collaborative engagement not only improves the community's understanding of climate risks but also enhances trust and collective action. The par-

ticipatory model underscores the importance of integrating environmental justice principles with innovative urban planning solutions to mitigate and adapt to climate impacts.

This paper contributes to the discussion on addressing the planetary crisis at the local level, with a specific focus on environmental justice and inclusive urban policies. By sharing lessons from the ESVA Climate Equity Project, this study aims to inform and inspire similar initiatives in other vulnerable coastal communities. The results emphasize the potential for community engagement to drive equitable and climate-resilient urban development, aligning with the broader goals of sustainable and inclusive urban transformation.

Retreat, Cooperate, Overlap. Rethinking spatial strategies for coexistence on the Medi-terranean coast within climate change

Authors: ELENA KASSELOURI¹; Giacomo Ricchiuto²; Rita Ventimiglia³

This contribution explores innovative planning strategies, still largely underexplored in the Mediterranean context, aimed at rebalancing and rethinking the interactions between anthropic systems and ecological processes along the coastline. The Mediterranean coast presents a complex composition of diverse coastal typologies, characterized by varying degrees of human occupation and a wide array of land uses. Within this heterogeneous framework, anthropogenic systems and local ecologies coexist in a delicate balance, increasingly threatened not only by anthropogenic pressures but also by the accelerating impacts of climate change. As a stratified geographic space of interactions, the Mediterranean coastal region is undergoing profound transformations due to climate change. Recognized as both a climate change and biodiversity hotspot, it faces rising sea levels, increasing land and sea temperatures, and shifting water balances, all of which are reshaping livelihoods and ecosystems. Within this context, Mediterranean coasts can be conceived as landscapes of coexistence, continuously transitioning and highly dynamic environments. These liminal territories, situated at the interface between land and water, present a certain spatial depth and width both seawards and landwards, functioning as buffer zones where transformations of coexisting systems permeate multiple layers, influencing both natural and human-made environments.

The paper examines landscapes of coexistence by focusing on medium-scale, often highly infrastructured and sparsely populated Mediterranean coastal territories, calling them 'Medi-terranean': small villages, dispersed urban agglomerations and small deltas. Despite their intermediate scale, these configurations are among the most widespread and dominant territorial formations within the basin, occupying a significant portion of the overall coastal area and, consequently, emerging as some of the most vulnerable regions to climate change. Specifically, the study investigates the notion of coexistence within these critical landscapes, proposing an integrated approach to address contemporary environmental and socio-spatial challenges on three case studies identified along the Medi-terranean coastal region, proposing three strategic approaches - retreat, cooperation, and overlap - as analytical lenses to explore potential opportunities for fostering diverse landscapes of coexistence: (i) retreat, that entails creating space for ecological processes by stepping back, removing permanent structures that disrupt ecological continuities, and establishing open spaces that allow natural systems to regenerate. By prioritizing ecological resilience, retreat facilitates the formation of open ecological corridors and buffer zones; (ii) Cooperation fosters dialogue between different systems within a shared space, conceptualized as an intermedial zone between the built and natural environments. By designing spaces that accommodate both human and non-human inhabitants, cooperation enables a middle ground where hybrid landscapes can emerge; (iii) Overlap strategy emphasizes spatial and functional integration, promoting a network of shared uses and activities that enhance synergies between anthropogenic and ecological systems. Overlap facilitates the formation of multifunctional landscapes, where interactions between human and natural processes are reinforced, creating a common ground. The findings of this explorative analysis underscore the necessity of making space for nature at multiple scales and through diverse approaches in order to redefine systemic interactions and reimagine future landscapes of coexistence along the Medi-terranean coast. Ultimately, this paper extends an open invitation to reconsider how we engage with "nature" within the planning and design processes.

Feminization of Energy Poverty in China: Contrasting Urban and Rural Experiences

Author: Hualing Xu¹

Co-authors: Jing Wu²; Kingsley E. Dogah³

Promoting gender equality and access to affordable, reliable, sustainable and modern energy are two pivotal components of the Sustainable Development Goals (SDGs) outlined by the United Nations. Specifically, SDG7 calls for reducing dependence on biomass materials (carbon-based fuel like wood, leaves, straw, cow dung, coal, etc.) as the main source of cooking fuel. Energy poverty is considered to have a woman's face (Sánchez, Fernández and Peiró, 2020). Earlier studies have revealed that the use of biomass in cooking imposes time, health, and environmental costs on households (Bukari, Broermann and Okai, 2021), with such costs often falling on women due to their traditional roles. Furthermore, geographical inequalities in energy poverty further intensify these gendered burdens, particularly the urban-rural disparity.

According to Zhang et al. (2019), approximately 48.98% of Chinese households are still experiencing energy poverty, with over 400 million Chinese individuals relying on traditional biomass and coal for cooking. The challenge is even more serious in terms of energy disparity. More than 75% of rural households primarily used coal and firewood as fuel sources (i.e., 17.1% and 58.6% with coal and biomass respectively), while 8.2% and 36.1% of households in urban and township areas used solid fuels for cooking (Lu et al., 2022). These facts indicate that the urban-rural disparity in energy poverty is still a pressing issue in China. Undoubtedly, gender inequality in the context of energy poverty is also a critical issue in China. This issue is particularly associated with the Chinese Confucian culture (Li et al., 2023), which has long emphasized traditional gender roles and hierarchical social structures. This cultural framework continues to influence contemporary societal norms, limiting women's access to energy resources and involvement in energy-related decisions, particularly in rural areas (Tang et al., 2020). As such, households influenced by Confucian culture tend to exhibit gender bias and are more likely to experience energy poverty. Therefore, promoting gender equality in energy poverty requires not only an economic solution but also a deep understanding of the cultural norms that shaped gendered access to energy. In this, it calls for a need for a comprehensive understanding of energy poverty as both a gendered and spatially embedded issue.

This paper employs a mixed-methods approach, which combines quantitative analysis of the China Family Panel Studies (CFPS) database with qualitative semi-structure interviews to capture the multi-dimensional features of energy poverty. Quantitative findings reveal rural women are disproportionately affected by energy poverty due to limited infrastructure, restricted economic opportunities, and lower education level, leading to an overreliance on biomass and other polluting fuels. Building on these findings, the qualitative analysis delves deeper into the underlying social and cultural factors that exacerbate these disparities. It shows how traditional Confucian culture norms influence the domestic roles of females related to energy poverty, such as family status, and overall well-being. Consequently, the qualitative research uncovers systematic marginalization of women in energy planning and policy-making processes, emphasizing the cultural and structural barriers that constrain their agency and perpetuate energy poverty. Together, these findings underscore the multi-dimensional characteristics of energy poverty in China and the importance of addressing both structural inequalities and cultural norms in crafting equitable energy policies.

By examining the lived experiences of women in urban and rural China, this paper helps to see the deep-rooted cultural standards and structural obstacles that aggravate energy disparities. It emphasizes the urgency of transformative strategies that go beyond mere technical fixes, advocating for gender-sensitive policies, inclusive decision-making systems, and culturally informed interventions to address systematic inequalities. By integrating ecological sustainability with social and spatial justice, this paper contributes to the broader pursuit of equitable and resilient societies.

T_05 ENVIRONMENT AND CLIMATE (A) / 1269**Simulating Urban Green Space's Cooling Impact on Adolescents' Sleep Quality Using Diverse Planning Approaches****Authors:** Yuan Gao¹; Shenjing He¹¹ *Department of Urban Planning and Design, The University of Hong Kong***Corresponding Authors:** sjhe@hku.hk, gaoyuan1999hhh@gmail.com

The intensifying global warming, coupled with urban heat island phenomena, have brought a wide range of health issues related to humid heat exposure, particularly in densely populated urban areas of tropical and subtropical regions (Zhang et al., 2023). Our prior research has demonstrated that humid heat exposure significantly jeopardizes adolescents' sleep health, with wet bulb temperatures ranging from 25-30 °C causing a three to sixfold increase in the risk of sleep disorders, markedly higher than when considering dry bulb temperatures alone (Gao et al., 2025). These findings underscore the urgent need for planning interventions.

Urban Green Space (UGS) mitigates heat in surrounding areas through enhanced evaporation, provision of shade, and improved air circulation (Gunawardena et al., 2017). Trees, grass, and soil can absorb excess heat and moisture, regulating air temperature and humidity, as demonstrated a crucial pathway to reduce urban humid heat in a recent global scale work (Yang et al., 2024). While several studies have examined specific UGS types and their cooling effects in relation to landscape features and neighboring land uses (Aram et al., 2019), few have assessed the cooling potential of UGS in conjunction with public health benefits or explored the spatial mismatches from a regional scale, hampering effective planning.

Our study utilized survey data from over 100,000 adolescents across six cities in China's Greater Bay Area, alongside land use data (30m resolution) and monthly climate data (1km resolution). We applied a random forest method to develop an atmospheric temperature prediction model, incorporating land use, NDVI, and various climate indicators,

achieving an average accuracy exceeding 0.9. We evaluated four distinct planning approaches for introducing new UGS: expanding existing large UGS, expanding existing small UGS, establishing new large UGS, and creating new small UGS. All proposed UGS were based on patches that were bare ground during the survey period, with their average NDVI values equal to the existing UGS. We integrated simulated scenarios with the temperature prediction model and linked these to a nonlinear regression model analyzing sleep disorder risks. Our findings indicated that adding approximately 2.3 square kilometers of new UGS significantly reduced the risk of sleep disorders for about 50% of the sampled adolescents. Expanding existing large UGS benefited the largest number of samples, while expanding existing small UGS yielded the lowest Gini coefficient for sleep disorder risks across all samples, indicating the most equitable outcomes. Establishing new small UGS had the least impact on cooling and health benefits, likely due to their location in suburban areas.

The four scenarios we analyzed highlight the common trade-offs between economic and social factors in urban planning. In China, the hierarchical breakdown of land use indicators at the provincial, municipal, and county levels serves as a widely utilized policy tool often accompanied by mandatory UGS requirements (Lin et al., 2023). Selecting small, low-value bare land patches to meet these requirements is cost-effective and minimizes social issues; however, it may lead to inefficient resource use considering climate and public health benefits. Conversely, expanding existing large UGS in city centers incurs high development costs due to premium land values, presenting potential challenges. As public health and its equity in the planning and development of UGS has often been neglected in past practices, it is essential to prioritize these factors to attain more effective and sustainable outcomes.

Understanding social acceptance of decarbonisation policies in planning towards positive energy districts

Author: Roos Timmers¹

¹ *Queen's University Belfast*

Corresponding Author: r.timmers@qub.ac.uk

Transformative change of the local urban energy system towards renewable energy consumption and energy efficiency is needed to diminish urban GHG emissions and pave the way towards climate-neutral cities. To secure carbon neutrality in cities, neighbourhoods offer critical sites for local action for climate mitigation and decarbonisation policies. An emerging body of literature on climate-neutral neighbourhoods and positive energy districts (PEDs) addresses how the district level unlocks potential for collective action by allowing for increased energy efficiency, flexibility and energy production. While technological interventions of the built environment are needed, pathways to PEDs need to be understood considering their social and behavioural dimensions. Therefore, it is a common understanding within the literature and as addressed within EU directive for PEDs framework that PEDs should include multidimensional objectives for ecological, social and economic sustainability. Nevertheless, most PED literature so far is technological in nature.

To understand the different social enablers and barriers to PEDs, a deeper understanding of social acceptance could provide a social lens on PEDs. An understanding of social acceptance PEDs and its social elements such as trust relations, local attitudes, social inclusivity, and behavioural change is still lacking. At the same time, a place-based approach by looking at the neighbourhood level is needed to allow for addressing context-specificities of complex sociotechnical configurations, relevant to understanding social acceptance processes. Moreover, as urban localities face different challenges such as high-density housing, limited available energy sources and a lock-in in existing local energy networks, understanding the social elements of PEDs could also further contribute to multiple approaches to social acceptance. Furthermore, neighbourhoods form complex interdependent social processes, social networks and power relations shaped by everyday practices and social interactions. Whereas traditional social acceptance literature has mainly focused on large-scale energy technologies, understanding acceptance of small-scale, decentralised and urban interventions has been limited discussed. Considering social elements such as energy vulnerability and energy justice, a local or even bottom-up renewable energy implementation could offer the possibility to empower communities while implementing technological interventions towards carbon neutrality. Nevertheless, it could also become contested spaces, addressing issues of heritage loss, displacement and social exclusion. These different elements can display the complexity of sociotechnical transformative trajectories but also address potential synergies that take place for drivers or barriers to effective energy policy implementation.

Therefore it will be argued that there is a need to incorporate a social understanding of transformative pathways to climate-neutral cities, by combining insights from PEDs literature with the wide body of social acceptance literature. While the technological focus within PED literature could benefit from social energy research, the urban context could provide new insights into social acceptance theories, by addressing the question how the urban context influences social acceptability of new energy systems. Additionally, a further critically analysis and elaboration on the meaning of the neighbourhood as site for local action is needed. As it is expected that by 2050 70% of the global population will be living in urban areas, the city as a location of renewable energy implementation will raise different encounters of resistance or potential enablers.

Living on the edge: How do perceptions of coastal erosion risk affect residential mobility decisions?

Author: Malachy Buck¹

¹ *Ulster University*

Corresponding Author: m.buck@ulster.ac.uk

Sea level rise and the increased intensity and frequency of extreme weather events such as storms and related storm surges, driven by climatic change, will increase such risks to coastal populations (IPCC, 2022). In the UK alone 82,000 properties are at risk of loss by the end of the century, with 2,200 of those by 2040 according to the UK's latest climate change risk assessment. There are high financial costs of managing and slowing the rate of coastal erosion, meaning that in many locations (including in the UK) there are significant uncertainties about where current coastal management policies of protecting coastal areas will be fulfilled (Sayers et al., 2022). This means that this paper sets out to explore issues which are likely to become more common in many nations.

This paper focuses on the experiences of households affected by coastal erosion, and how the institutional frameworks regarding the management of coastal erosion affect residential decision-making, a topic which to date has received limited attention. It explores residential decision-making when a decision is made to not defend a coastline against erosion. It does so by presenting the findings of a series of interviews with residents on the Holderness coast in the UK, the fastest eroding coastline in Europe.

Its key scientific contribution is in providing an understanding of the experience and impacts of coastal erosion upon communities and how this affects risk perceptions and residential mobility decision-making. The research seeks to understand how individuals interpret, perceive and weigh up the benefits and risks from moves into, and out of properties at risk of erosion (Raaijmakers et al., 2008).

The positive experiences of living in a rural, coastal location are explored in the paper. This contrasted with the negative experiences of erosion, and the associated feelings of unfairness, physical decline and related loss of amenity and perceived abandonment by local government. This, in addition to the significant reduction in financial value of property influenced the balance between benefit and risk resulting from a residential move into or out of the study area. For some, the benefit of a discounted home served to encourage a move into the area, despite the presence of risk. For others, the range of benefits associated with living in the study area meant they were unwilling to move away, despite the risk.

Residential moves into the study area may seem irrational. An important contribution of this paper is to illustrate that they are the result of the balancing of intuitive judgments of risk and benefits in the residential decision-making process. An inward move represented an example of residential decision-making where the tangible benefit of a house at a heavily discounted price, along with a series of other less tangible benefits (e.g. place attachment and amenity benefits of living in such locations) outweighed the perceived risk. The balance between risk and benefit did not explain the situation completely. In some cases, the low value of homes meant some household's financial resources could not support a move away from risk. This underlined how the absence of compensation for the effects of erosion means the impacts of erosion fall disproportionately on lower-income households.

The paper goes on to consider the policy and practice implications, exploring the fairness of compensation regimes, and understanding how changes in governance frameworks for managing coastal change at the coast can be fairly and smoothly implemented. By doing so, the paper draws connections between climate adaptation, coastal management, public perceptions, and residential decision-making.

Forming to inform: the role of ecosystem services knowledge for climate adaptation planning

Author: Alessandra Longo¹

¹ *Iuav University of Venice*

Corresponding Author: alongo@iuav.it

The growing recognition of the value of nature in addressing current environmental challenges calls for widespread consideration in spatial planning and decision-making processes. Of the many ecosystem services (ES) that nature can provide, some can directly influence the reduction of extreme events severity and, therefore, help adaptation to the impacts of climate change, particularly in urban contexts. However, it is precisely climate impacts in combination with human activity that are compromising the ability of ecosystems to provide these services.

This contribution describes research developed in support of the process of updating and revising the "Piano di Governo del Territorio (PGT)", the planning tool of the Autonomous Region Friuli Venezia Giulia, Italy, taken as a case study. The administration's objective is to make the tool more flexible and capable of adapting to changing territorial, environmental and social dynamics for eco-sustainable and resilient spatial planning. Concerning the context of the PGT, this research considers the multi-sectoral and multi-scalar aspects that characterise both the ES approach and the climate adaptation processes, then investigates the interdependence between these two themes to promote their integration in plans and policies. It assumes ecosystem services to be tools for assessing territorial performances through which to analyse the territory, as they can be both enabling factors in enhancing an adaptive reading and factors exposed to natural and anthropogenic threats. In this sense, building knowledge on ES can represent an opportunity to guide the inclusion of adaptation processes in planning tools and inform sustainable decisions.

First, the research identifies the main barriers to the implementation of ES in planning from a literature review. Second, it reflects on the ways to overcome these barriers by developing an integrated decision-support model, i.e., a practical context-specific toolkit that can, at the same time, make a theoretical contribution to the discipline of spatial planning. The focus is placed on a subset of ES that can foster adaptation, which in this research takes the name of Ecosystem Services for Climate Change Adaptation (ESCCA). The model consists of three main phases: (i) assessing the supply of ESCCA, (ii) defining the demand for ESCCA and identifying deficit areas, i.e., those areas where demand is not met by supply, and (iii) based on the latter, guiding the selection of appropriate nature-based solutions.

The aim is not to reach the best solution but to inform and train decision-makers to understand the importance of these two interconnected issues and their role in ordinary planning. Thus, the discussion will not focus on the methodology but more on the results obtained and the process of building a climate action and transition-oriented reasoning as an innovative guideline to adopt a new approach rather than one more tool. That makes it possible to promote forward-looking and cross-sectoral actions, not relegated

to extraordinary planning, which appears outdated in light of the current planetary crisis. Finally, the research returns to the barriers found in the literature and, looking at Friuli Venezia Giulia's PGT, proposes valuable observations and take-home messages from the case study and beyond.

For thousands of years, coastal areas have been shaped and their resources effectively utilized by humans. Today, coastal areas face demands for industrial, commercial, and recreational use (Kay & Alder, 1999; Akyarlı, 2002). The processes of coastal areas have been shaped by different management approaches over time, with notable periodic differences evident in the coastal management classifications by O'Riordan and Vellinga (1993). Between 1950 and 1970, sectoral approaches dominated, and ecological factors were often overlooked. From 1970 to 1990, greater integration between sectors and public participation were achieved. Between 1990 and 2000, a sustainable development-oriented approach was adopted. It is predicted that future coastal management will be based on principles of ecological empathy, precautionary management, and collaborative governance. Building on this prediction, the study examines the impact of projects implemented along the Eastern and Central Black Sea coasts on the sustainability of coastal areas.

The main issue addressed in this study is to discuss the impact of the approach adopted for the planning of coastal areas in Turkey on the sustainability of coastal areas, using case studies from cities on the Eastern and Central Black Sea coasts. In the study, approaches to coastal planning and example applications are discussed within the context of global examples, while the 'coastal legislation,' which is the primary foundation for coastal area planning and regulation in Turkey, is also examined in the context of its legal framework for implementation.

The study will be carried out in three stages:

1. A literature review on sustainable coastal planning and an evaluation of Turkish coastal legislation within this framework.
2. A total of 22 projects will be evaluated through the creation of 'project identity cards,' comprising 7 projects from Turkey—primarily the Black Sea Coastal Road Project and other initiatives completed in the coastal cities of Samsun, Ordu, and Trabzon—as well as 15 coastal projects selected from global examples. The spatial and environmental impacts of these projects will be thoroughly assessed.
3. Six reclamation projects, which stand out and show differentiation in terms of environmental impacts within the study area, will be examined in detail. Based on the findings, recommendations for sustainable coastal planning will be developed.

Global examples show diverse approaches to coastal management. In Australia and the UK, ecological value is prioritized, while in the US, Singapore, and the Maldives, economic value takes precedence. Sweden and Denmark focus on transforming idle coastal areas sustainably, balancing conservation and use. Conversely, the US, Singapore, and the Maldives often emphasize economic exploitation. Italy focuses on enhancing agricultural production, and South Korea showcases sustainable development through smart cities. The Philippines and Malaysia have large-scale artificial island projects, while Dubai's tourism-driven development has raised concerns about environmental impact and sustainability. These examples reflect how coastal management priorities vary by region, balancing ecological, economic, and social goals.

In Turkey, the Black Sea Coastal Road is a major reclamation project linking coastal cities, sparking reclamation projects in most areas except Ordu. In Samsun, the road runs partly along the coast, with reclamation projects focused on tourism and recreation. In Trabzon, the road follows the coast, with large urban developments like hospitals and stadiums, making it a unique case due to planning uncertainties. Ordu, however, stands out as the road hasn't led to reclamation projects; instead, sustainable coastal development has allowed for economic and social activities.

In conclusion, coastal area management examples emphasize the need to balance ecological, economic, and social values to prevent long-term issues, with the Black Sea Coastal Road highlighting the importance of considering coastal impact in large-scale projects, ensuring reclamation areas align with urban fabric, sustainability, and social benefits.

Exploring coastal boundaries: trasformative planning as a tool for territorial resilience

Author: Vittoria Ridolfi¹

¹ *Università IUAV di Venezia*

Corresponding Author: vridolfi@iuav.it

The planetary crisis, driven by the accelerating impacts of climate change and environmental degradation, places coastal areas at the forefront of a global challenge. These transitional spaces between land and sea are home to a significant proportion of the

world's population, rich cultural heritage, and essential ecosystems. Yet, they face escalating pressures from hazards such as sea-level rise, coastal erosion, and extreme temperatures, which disrupt social, economic, and ecological systems. In this context, spatial planning emerges as a transformative tool to mediate competing interests and navigate the complexities of coastal adaptation, ensuring socio-ecological resilience.

The concept of the coast itself encapsulates the multidimensional nature of this challenge. Ketchum (1972) defines the coast as “the band of dry land and adjacent ocean space (water and submerged soil) where terrestrial processes and land uses directly affect oceanic processes and uses, and vice versa.” However, Sorensen and McCreary's (1990) distinction between coastal zones and coastal areas highlights the ambiguity and variability of these spaces, shaped by ecological, geomorphological, and socio-economic forces. This plurality complicates efforts to define, delimit, and manage coastal territories, which are intrinsically fluid and dynamic.

Historically, coasts have been recognized as fragile and high-risk environments. Bultrighini's (2013) exploration of coastalness versus inlandness in the Mediterranean underscores the intrinsic vulnerability of coastal areas and their heightened exposure to risks compared to inland territories. Climate change exacerbates these vulnerabilities, intensifying tensions linked to urbanization, tourism, and ecological degradation. Coastal territories remain exposed to overlapping hazards that transcend administrative and disciplinary boundaries, challenging the capacity of existing governance frameworks to provide effective solutions.

This contribution critically examines the interplay between definitions, delimitations, and vulnerabilities in coastal areas, aiming to inform more effective planning and governance practices. Drawing on perspectives from geography, environmental studies, and urban planning, it explores how differing conceptualizations of coastal spaces influence the identification of hazards and the design of adaptive strategies. Coastal areas cannot be managed merely as physical spaces through sectoral technical tools; they demand an integrated, interdisciplinary approach. Planning must embrace the coast as a complex system, where ecological, economic, social, and cultural variables intersect.

Spatial planning, when applied to coastal management, faces the challenge of integrating multiple scales and addressing the inherent dynamism of these areas. To become a transformative tool, planning must account for the hybrid nature of coastal systems, balancing ecological integrity with socio-economic needs, overcoming static boundaries and disciplinary silos, and fostering resilience by recognizing the fluidity and interconnectedness of coastal environments.

This initial phase of research focuses on defining and delimiting coastal spaces, recognizing that governance tools currently in place often fail to capture the complex, transboundary nature of these territories. The task of managing coastal areas requires acknowledging their hybrid and fragile character, where diverse and overlapping interests intersect. Understanding these territories as dynamic systems necessitates a deeper inquiry into the reasons, they remain central to academic and policy debates. By exploring these dynamics, the aim is to reshape coastal governance frameworks, leveraging interdisciplinary collaboration and multi-scalar approaches to transform coastal resilience and sustainability into a cornerstone of the response to the planetary crisis.

T_05 ENVIRONMENT AND CLIMATE (A) / 433**Coordinated Development and Coupling Mechanisms of Capital Flows and Carbon Emissions from the Perspective of Environmental Justice****Authors:** Ting Zhang¹; Yuanhong Qiu²; Jianzhong Huang¹¹ *Tongji University*² *Chongqing University***Corresponding Authors:** 18089545176@163.com, cqquyh678@163.com

This study addresses the critical need to balance economic development with environmental sustainability, focusing on the coordination between capital flows and carbon emissions in the economically developed Yangtze River Delta (YRD) region from the perspective of environmental justice. By investigating the coupling mechanisms between resource allocation and carbon emissions, the research seeks to uncover the dynamic interactions that drive regional sustainability. It further aims to classify and analyze the types of imbalances to offer actionable insights for addressing environmental disparities. Using micro-level data on corporate capital investment in the YRD and carbon emission network grid data, the study employs complex network analysis and a coupling coordination model to evaluate regional coordination levels and identify areas of extreme imbalance. Through a typological framework, regions are categorized based on the degree and nature of their discordance, and a multiple linear regression model is applied to explore the underlying mechanisms that link capital flows and carbon emissions. The findings reveal that the coupling mechanisms exhibit significant variation across sectors and regions. In sectors such as electricity, transportation, and finance, there is a pronounced mismatch between capital flows and carbon emissions. For instance, the electricity sector's disjointed areas are concentrated in Northern Jiangsu and Anhui provinces, reflecting inadequate investment in low-carbon infrastructure. In the transportation sector, coordinated areas are mainly found in provincial capitals and cities near Shanghai (e.g., Suzhou, Wuxi, Nantong) and Ningbo, while other regions face severe imbalances due to inefficient transportation networks and high emission intensities. The financial sector demonstrates better coordination in economically vibrant areas such as Shanghai, Hangzhou, Hefei, Ningbo, Wenzhou, and Jiaxing, with other regions lagging behind. Conversely, the agricultural and industrial sectors show relatively higher coordination, though localized imbalances persist, particularly in Anhui, Zhenjiang, Zhoushan, and parts of Northern Anhui and Southern Zhejiang. By categorizing these imbalances, the study identifies distinct factors contributing to the lack of coordination, including disparities in technological adoption, regional economic structures, and policy implementation. The coupling mechanisms reveal that regions with higher levels of capital investment in green technologies exhibit improved coordination, while areas with limited resources face heightened environmental and economic risks. This research underscores the importance of differentiated policy interventions tailored to regional contexts, advocating for equitable resource allocation and low-carbon development strategies to promote environmental justice. By integrating coupling mechanisms and typological analysis, the findings provide a nuanced understanding of the interplay between capital flows and carbon emissions, offering robust guidance for policymakers to achieve sustainable development and carbon neutrality in the YRD and beyond.

T_05 ENVIRONMENT AND CLIMATE (A) / 504**Integrating equity in adaptation planning: identifying and prioritizing projects for the biggest impact****Author:** Stephanie Erwin¹**Co-authors:** Birgitt Ouweneel¹; Jeroen Kluck¹; Sába Schramkó¹

Climate change and urbanization are intensifying heat stress risks, threatening public health and liveability (Böcker & Thorsson, 2014; Ebi et al., 2021; IPCC, 2022). Rising temperatures disproportionately affect vulnerable populations, including those with limited mobility, low incomes, or health conditions (Ellena, Breil, & Soriani, 2020; Gronlund, 2014; Reid et al., 2009; Voelkel et al., 2018). Local governments tasked with equitable implementation often struggle to translate national, regional, and local policy ambitions into impactful adaptation projects (Ende et al., 2022). Despite the EU's commitment to prioritize vulnerable populations in adaptation, implementation of equitable planning processes remains limited (Birkmann et al., 2020; ETC/CCA-LULUCF, 2023).

Conventional heat adaptation planning focuses narrowly on hazard indicators like Physiological Equivalent Temperature (PET), often ignoring the socio-economic, health, and demographic factors that shape vulnerability (Ellena, Breil, & Soriani, 2020). This narrow approach overlooks the compounded challenges faced by marginalized communities, whose vulnerabilities result from intersecting social, economic, and environmental factors (Harlan et al., 2006; Kang, Park, & Jang, 2024). While mainstreaming supports effective adaptation (Biesbroek, 2021), municipal silos and sectoral planning hinder integrated solutions, necessitating a transdisciplinary framework incorporating diverse risk indicators, policy guidance, and stakeholder collaboration (Frans et al., 2016). By dismantling silos and fostering co-creation, this approach ensures equitable and effective adaptation planning grounded in practical realities.

Cool Cities, an EU Interreg NSR project, develops a framework for heat stress adaptation that encompasses short-, mid-, and long-term planning horizons. The approach incorporates diverse indicators—meteorological, environmental, socio-economic, health, and demographic—to ensure equitable outcomes and prioritize projects for marginalized populations. Eight partner municipalities from five EU countries serve as testing grounds to empirically validate the approach across diverse political and governance contexts, yet facing comparable heat-related threats. Effective adaptation relies on (policy) integration across sectors. This study fosters transdisciplinary collaboration, by engaging municipal stakeholders to optimize co-benefits and synergies, prioritizing locations where heat and related challenges are addressed integrally. Ultimately, the project aims to bridge the implementation gap by promoting actionable, equitable, and streamlined adaptation planning practices.

This study adopts a data-driven methodology to design “cool networks”—city-wide network of thermally comfortable locations and slow-traffic routes, consisting of pedestrian and cycling pathways. A GIS-based thermal comfort assessment is conducted using high-resolution PET maps to identify and optimize these networks. Through a zonal histogram, 100x100-meter grid cells are evaluated to determine their compliance with thermal comfort thresholds. Primary slow traffic routes, are overlaid onto this grid to map existing cool networks and identify gaps. A GIS-based risk assessment is then conducted integrating hazard indicators (e.g., PET), exposure metrics (e.g., population density), and vulnerability indicators (e.g., health conditions, socio-economic status). This approach establishes a long-term vision for a cool network, and identifies areas where adaptation interventions are most urgently needed or likely to yield the greatest impact. To ensure prioritization is inclusive, equitable, and context-sensitive, the process incorporates a policy scan and participatory framework. Co-creation sessions, utilizing Multi-Criteria Analysis with municipal stakeholders, including planners, designers, engineers, and other urban professionals, are facilitated to prioritize projects by combining qualitative insights with quantitative data. Institutional knowledge ensures that local expertise, governance structures, and practical considerations are integrated into decision-making.

This research offers planners a replicable, equity-focused framework for addressing heat challenges through cool network planning. Combining GIS-based risk assessments, policy scans, and co-creation, it ensures adaptation strategies are data-driven, context-sensitive, and inclusive. By prioritizing projects transparently based on feasibility, equity, and impact, the framework integrates heat resilience with mobility planning, emphasizes vulnerable populations, and supports broader sustainability goals like active transportation and biodiversity. This approach advances the EU's commitment to equitable climate resilience, fostering thermally comfortable, accessible, and socially equitable cities.

Optimizing Decision-Making for Climate-Neutral Post-War Buildings: The Architect's Role in Sustainable Transformation

Author: Kathrin Meyer¹

¹ *HafenCity Universität Hamburg, Germany*

Corresponding Author: kathrin.meyer@hcu-hamburg.de

The transition to a climate-neutral building stock by 2045 is a pressing objective for the architectural and construction sectors. This research examines the decision-making processes surrounding the renovation, roof extension, and potential demolition of post-war residential buildings in Germany, with a focus on the architect's role in integrating environmental and climate considerations into the planning process. By employing qualitative methods—notably expert interviews and qualitative content analysis—the research investigates the complexities and barriers to aligning construction practices with sustainability goals.

Research Context

Architectural discourse surrounding post-war buildings from the 1950s and 1960s emphasizes their potential for modernization and densification (BSW 2023, Meyer et al. 2023, BBSR 2016). These buildings, constructed prior to Germany's first thermal insulation ordinance in 1977, exhibit low energy efficiency and limited modernization. Despite the environmental advantages of preserving and upgrading existing structures—such as reduced embodied carbon and resource conservation—demolition and new construction often dominate decision-making. Current processes are fragmented and inefficient, impeded by uncertainties in cost estimation, technical feasibility, and stakeholder alignment. These challenges underscore the urgent need for systematic, climate-neutral approaches to managing existing building stocks.

Research Objectives

This research is part of a broader doctoral study that addresses the central question: How can decision-making processes for managing post-war building stocks be optimized

to achieve climate neutrality effectively and efficiently? While the overarching research encompasses various aspects of decision-making, this paper specifically focuses on one critical element: the role of architects in influencing and guiding these processes. The study explores the following research sub-question:

- What role do architects play in influencing and guiding decision-making processes towards sustainable and climate-conscious outcomes?

While substantial literature exists on technical retrofitting and energy efficiency, limited empirical research explores the practicalities of decision-making, particularly how stakeholders interact and navigate trade-offs among competing priorities. This study bridges that gap, offering actionable insights into the mechanisms underpinning these processes.

Methodology

The research adopts a qualitative approach, combining expert interviews and content analysis to explore:

- Stakeholder Dynamics: Identifying the roles and influences of property owners, architects, and specialist planners.
- Process Challenges: Analyzing critical decision phases and disruptions, including late technical investigations and conflicting priorities.
- Sustainability Integration: Assessing how sustainability dimensions—embodied energy, resource efficiency, and climate neutrality—are embedded in decision-making frameworks.

Theoretical Assumptions

The absence of structured frameworks for evaluating renovation, extension, or demolition options hinders effective decision-making in architectural planning. Early involvement of specialized planners is essential to mitigate inefficiencies and manage costs. While sustainability is emphasized in political and social discourse, economic and technical constraints frequently overshadow these goals. Architects, as pivotal actors, can profoundly influence sustainability outcomes through their advisory and design roles. However, their potential impact is often constrained by fragmented workflows and unclear stakeholder responsibilities.

Conclusion

Optimizing decision-making for post-war building stocks is crucial to achieving climate neutrality by 2045. Prioritizing renovation and roof extensions over demolition aligns with sustainability goals by reducing embodied carbon and conserving resources. This research contributes a framework for managing Germany's post-war architecture, advocating interdisciplinary collaboration and innovative planning as transformative actions in addressing climate and environmental challenges. By highlighting the pivotal role of architects in sustainable urban transformation, this study emphasizes the importance of planning as a proactive response to the planetary crisis.

This paper aligns with the thematic emphasis on sustainable cities and climate action, illustrating the transformative role of planning in addressing contemporary environmental challenges.

T_05 ENVIRONMENT AND CLIMATE (A) / 721**Local Level Coastal Adaptation: Evaluating Queensland's QCoast2100 Program****Author:** Aysin Dedekorkut-Howes^{None}**Corresponding Author:** a.dedekorkut@griffith.edu.au

Climate change impacts such as rising sea levels and the increasing intensity of storms and cyclones pose growing risks to Australia's lifestyle, environment, and economy. Queensland is one of the most vulnerable states to the coastal climate change impacts in Australia with the highest number of residential and light industrial buildings and the greatest value of existing road infrastructure at risk from a sea level rise. More than 80 percent of Queenslanders live on the coast. In 2016 Queensland government launched the QCoast2100 program which funds coastal local governments to prepare Coastal Hazard Adaptation Strategies (CHAS). Of the 31 coastal councils participating in Phase One of the project 28 of them produced a strategy. Prior research provided a comparative analysis of adaptation to sea-level rise and coastal flooding in all Australian states and territories; however, no such assessment at the local level exists. This project examines local level coastal adaptation through the example of QCoast2100 program. The research focuses on strategies for managing the climate change impacts in Australian coastal settlements and aims to answer the following questions: "How effective has the QCoast2100 program been in improving coastal resilience? Are the Coastal Hazard Adaptation Strategies sufficient? How can they be improved?"

These questions are answered through 47 semi-structured interviews with key stakeholders involved in strategy preparation and implementation. Interviewees include local government officers, consultants, program managers, and expert panel members who reviewed the completed strategies. The semi-structured interviews aim to understand the process through which these plans were produced, areas that can be improved as well as what is needed for their implementation.

Findings indicate that the QCoast2100 program was invaluable in putting coastal hazards on the agenda of local governments. Without the funding, technical support and guidance provided by the Local Government Association of Queensland through the program most local governments would not have been able to undertake such a task. The Strategies produced are viewed as a starting point and provide an understanding of the coastal risks and timelines. In most cases, they are used as basis for funding applications for implementation of the adaptation actions identified. Without this additional funding most local governments do not have the necessary resources to implement the strategies. Majority of the councils do not have dedicated staff for this program and lack of capacity and expertise are hampering the implementation.

Most interviewees found the initiative successful and agree that the presence of uniform guidelines and all coastal local governments undertaking it at the same time was very useful. The program has been a model for similar programs in the states of New South Wales and Victoria. A limited number of consultants worked on multiple projects across the state and were able to apply the lessons they learned from one project to the others. There was overall agreement that the produced documents got better and better with the experience of the earlier ones. The local networks formed with neighboring governments to exchange information was also found to be very valuable.

One of the challenging aspects of the strategy preparation process was public engagement. Controversial topics included climate change, managed retreat, and protection structures. Most documents avoided using the term retreat and substituted transitioning and/or repurposing. In general, the strategies do not view retreat as an urgent issue, but as something that needs to be considered in a couple of decades time. Local governments are unwilling to commit to options they cannot fund and that may prove to be unpopular with their electorates. In this regard, adaptation pathways approach provides local governments a way to broadly consider retreat without making any firm commitments.

T_05 ENVIRONMENT AND CLIMATE (A) / 586**Addressing Synergistic Health Risks of Extreme Heat and Air Pollution Under Climate Change: A Citywide Spatial Assessment in Shanghai, China**

Author: Zhen He¹

Co-authors: Jingkai Zhao ¹; Jinghao Hei ¹; Zhiqiang Wu ¹

¹ *Tongji University*

Corresponding Authors: 2210292@tongji.edu.cn, heijinghao@tongji.edu.cn, jingkaizhao@tongji.edu.cn, wus@tongji.edu.cn

Background

Amidst intensifying climate change, urban regions around the globe are experiencing more frequent and severe extreme weather events. In particular, the frequency and intensity of heatwaves have risen substantially, with the urban heat island effect further exacerbating extreme heat conditions. This escalation contributes to increasing mortality and morbidity, creating a major public health challenge worldwide. Furthermore, growing evidence indicates a strong correlation between heatwaves and elevated levels of air pollutants, notably particulate matter (PM_{2.5} and PM₁₀) and surface ozone. These dual environmental pressures, extreme heat and air pollution, pose heightened health threats. Additionally, the global onset of population ageing is expected to intensify the susceptibility of individuals to environmental exposure risks, therefore increasing the overall disease burden. Although many studies have separately investigated the health consequences of extreme heat or air pollution, comparatively fewer have focused on their combined effects, especially in terms of spatial precision for assessing compound health risks.

Purpose

This study aims to clarify the synergistic health impacts of extreme heat and air pollution within a high-density urban environment under intensifying climate change. By integrating multi-source remote sensing and health outcome data at a 1 km² spatial resolution, we aim to pinpoint critical health threshold phenomena for both temperature and pollutant concentrations and discern the socio-spatial environmental health risk disparities that emerge. Through this citywide analysis in Shanghai, we endeavor to highlight key hotspots and at-risk groups, thereby informing evidence-based, region-specific public health strategies and environmental interventions for policy makers and urban planners.

Methods

Focusing on Shanghai—a prototypical high-density urban environment—we integrated a spatial resolution of 1 km×1 km multi-source remote sensing data with health outcome datasets. We then developed an interpretable spatial machine learning model to quantify the synergistic effects of extreme temperatures and air pollution on health. Additionally, by leveraging the IPCC's Hazard-Exposure-Vulnerability assessment framework, we performed a citywide, grid-level (1 km²) health risk analysis covering multiple environmental stressors. Specifically, satellite-derived land surface temperature measurements and ground-based air quality monitoring provided spatially and temporally resolved exposure indices, while hospitalization and mortality records enabled detailed evaluations

of adverse health events. This model architecture balanced predictive accuracy with interpretability, allowing us to probe complex nonlinear interactions between heat stress and pollution levels and to achieve a spatially refined health risk assessment.

Results

Our findings reveal significant nonlinear associations and threshold effects among environmental exposures and health outcomes, suggesting that the combined influence of extreme heat and air pollution cannot be seen as merely additive. Certain temperature thresholds and pollutant concentration levels were linked to disproportionately steep rises in cardiovascular and respiratory admissions, suggesting that both the intensity and duration of exposure are critical factors driving negative health outcomes. The spatially explicit risk assessment of the dual environmental exposures revealed substantial heterogeneity in exposure to both extreme temperatures and air pollution, pinpointing several high-risk zones that exhibit pronounced vulnerabilities due to demographic and socioeconomic profiles. Specifically, areas with higher concentrations of elderly populations in urban centers, as well as those adjacent to industrial sites, experienced notably elevated risk levels. These findings underscore the importance of adopting region-specific strategies and targeted interventions, particularly for populations most susceptible to environmental stressors.

Conclusion

Our research addresses a critical gap in understanding the synergistic health risks posed by extreme heat and air pollution in the context of climate change, offering a pioneering city-scale spatial precision assessment of these compound impacts. The findings accentuate the urgency of targeted urban planning and policy measures to mitigate such risks, enhance sustainability, and promote socio-spatial justice in rapidly evolving urban environments.

Trade-offs in Urban Planning: Insights from Coordinating Green Space Preservation and Affordable Housing in Vienna

Authors: Mark Scherner¹; Michael Friesenecker¹; Thomas Thaler¹

¹ BOKU University Vienna

Corresponding Authors: thomas.thaler@boku.ac.at, mark.scherner@boku.ac.at, michael.friesenecker@boku.ac.at

The global climate crisis exacerbates local environmental challenges, such as human losses, negative health impacts, and loss of biodiversity. Cities in particular are highly prone to the negative impacts of a warmer climate. While cities are highly attractive to individuals, they lack of green and blue spaces, and often have high levels of social vulnerability. In response to these challenges, the question lies how we can improve our individual and societal resilience. Nature-based solutions (NbS), such as the construction or preservation of large green spaces, green roofs, tiny forest, ponds etc., are an essential solution for cities. Especially, NbS are very attractive for different actors as they can provide various ecosystem services such as cooling corridors, improved individual well-being, and biodiversity, and are often no-regret solutions, often showing a positive cost-benefit ratio compared to grey solutions such as air conditioning. Yet, increasing urbanization and housing development are putting pressure on large-scale NbS, especially historic greenbelts. At the same time, the global housing affordability crisis continues to make the construction of affordable housing a priority. Under these prevailing economic conditions, planning for affordable housing seems to be limited to peripheral, undeveloped areas where land prices are moderate and in public hand. As a result, land-use conflicts and trade-offs in urban planning are emerging over whether to protect large, biodiverse green areas or build affordable and social housing. This study examines the case of Vienna, analyzing current perceptions, trade-offs and approaches to coordinating the competing goals of green space preservation and the provision of affordable housing. The results are based on a policy analysis of greening, planning and housing policy documents, as well as expert interviews with 20 actors from city politics and administration. Preliminary results indicate that increasing density and further provision of green spaces are perceived as potential solutions. Others, however, see trade-offs between these planning solutions as inevitable and claim they remain a challenge to policy coordination. Currently, the city's climate adaptation policy prioritizes densely built-up, overheated inner-city areas for implementing small-scale NbS, while simultaneously aiming to preserve large green areas on the outskirts to prevent further soil sealing. Despite these efforts, the city has less capacity to prioritize an affordable densification of the inner-city private housing market. Instead, Vienna's urban development target areas allocate public land on the outskirts of the city for new social housing. Yet, the majority of actors do not perceive trade-offs between green space preservation and affordable housing because they only practice in one of the two jurisdictions. This case study highlights the importance of coordinating planning policies and their respective trade-offs to address local environmental challenges effectively.

The Relationship between Climate Action Plans and Spatial Planning: The Case of Gaziantep City Center

Authors: Emine Zorkirişçi^{None}; Yasin Bektaş¹

¹ Advisor

Corresponding Authors: yasinbektas@itu.edu.tr, eminezorkirisci.98@gmail.com

Climate change and urban planning exhibit a strong interplay. Achieving sustainability goals critically depends on the integration of climate action plans developed at both

national and local scales into spatial plans. Having become a party to the Kyoto Protocol (2009) and the Paris Agreement (2021), Türkiye has maintained its commitments to reduce greenhouse gas emissions and, in line with these commitments, developed national-level strategies and action plans. At the local level, 18 metropolitan municipalities have prepared their own climate action plans, thus taking an active role in combating the climate crisis.

This study examines how national-level climate action plans are reflected locally and assesses the degree of integration between local climate action plans and spatial plans, focusing on the case of Gaziantep. Gaziantep prepared its first Climate Change Action Plan in 2011, updated it in 2016, and, having signed the Covenant of Mayors in 2017, established its Sustainable Energy and Climate Action Plan (SECAP) in 2018. Subsequently, in 2021, the city joined the Green Cities Program and published the “Green City Action Plan” in the same year, articulating a vision for sustainable and resilient urban development.

An evaluation of the local plans prepared after 2011 in Gaziantep’s urban center (the districts of Şehitkamil and Şahinbey) indicates that the integration of climate action plans into spatial plans has remained limited. For instance, despite the development of renewable energy projects under SECAP, direct alignment with spatial plans has not been achieved. Moreover, the Green City Action Plan particularly underscores the lack of a long-term and holistic approach within the “Land Use” sector. This underscores the need to update local land-use plans (Master Development Plans and Implementation Development Plans) in harmony with the climate action plans.

The Green City Action Plan is divided into sectors under the headings of “water, energy, solid waste, transportation, land use, buildings, industry, and climate action.” Within the water sector, under the sub-action of “developing an integrated plan for water resources management,” projects and actions focusing on rainwater management and water reclamation are proposed to combat drought risk. In the transportation sector, the sub-action of “continuing the expansion of the rail system network,” as well as the “ecological village” sub-action under the climate action sector, both have clear links to local land-use plans (Master and Implementation Plans). In the industrial sector, the sub-action of “establishing an industrial zone for renewable energy production” includes the objective of preparing the necessary zoning and parceling plans. However, research findings indicate that these sector-specific sub-goals are not sufficiently integrated into spatial planning processes.

In conclusion, in the Gaziantep case, the relationship between local-scale climate action plans and spatial plans is not at a satisfactory level in terms of enhancing resilience to climate change and achieving sustainable urban development. It is critically important for the strategies identified in climate action plans to be concretely reflected in spatial plans of varying scales and degrees of detail in order to ensure that the urban environment becomes both sustainable and climate-resilient.

Understanding the usability of climate services –An Actor Network Theory perspective

Author: Gerben Koers¹

Co-authors: Kevin Raaphorst¹; Merel van der Wal¹; Gerald Jan Ellen²; Sander Meijerink¹

Climate adaptation is becoming increasingly critical in urban spatial planning as extreme weather events necessitate climate-adaptive measures. Effective planning relies on climate information to provide insight in potential climate impacts and/or the effectiveness of proposed adaptive measures. Such information is often provided by ‘climate services,’ such as maps or decision support tools, which spatial planners and other stakeholders use to guide decision-making (Vaughan et al., 2016). However, usability gaps - e.g., mismatches between user needs and provided data, or a lack of user expertise to interpret the information - limit their usability (Raaphorst et al., 2020; Lemos et al., 2012).

Recent research also highlights the role of contextual factors in shaping climate service usability. Contextual influences, such as institutional settings or competing priorities, significantly impact how stakeholders perceive and interact with these services (Findlater et al., 2021; Koers et al., 2024). However, most contemporary evaluation methods focus on human-centric perspectives, emphasizing the direct interactions between users and climate services (e.g., Vaughan & Dessai, 2014). While valuable, this approach is limited as it overlooks broader contextual influences and the positioning of climate services within wider decision-making systems (Koers et al., 2024). As a result, indirect contextual factors often remain overlooked in evaluations.

To address these limitations, we propose the use of an Actor-Network Theory (ANT) perspective. ANT views the world as a collection of interacting actors—both human and non-human—within networks that shape behaviours and outcomes (Law, 2004). Applying ANT to climate service usability evaluation shifts the focus from user-centric evaluations towards understanding usability as an intrinsic property of climate services as non-human actors. In other words, an ANT-perspective examines how climate services interact with other actors within broader networks, and in turn reveals how contextual factors influence usability. This helps to identify overlooked aspects of climate service usability by examining how human actors (e.g., planners, politicians) and non-human actors (e.g., legislation, policy documents, climate services) interact with and shape usability of the climate service. This study aims to demonstrate how integrating an ANT perspective broadens the understanding of climate service usability. By moving beyond user-centric evaluations, ANT provides a more comprehensive lens to assess the interplay of human and non-human actors within complex decision-making contexts. This results in a more nuanced understanding of usability, enabling the identification of barriers and opportunities for improving the use of climate services in practice.

For this paper, we follow and analyse a project of the municipality of Dordrecht (the Netherlands). Within this project, the municipality is utilizing a climate service to support decision-making among spatial planners, water managers, project leaders, and politicians to develop new policies for improving the climate resilience of the neighbourhood of ‘Dubbeldam’. Data collection includes interviews with stakeholders, observations during project meetings, and analysis of policy documents, agendas, and reports. Furthermore, found contextual factors are analysed following the method utilized by Koers et al. (2024). This allows for comparison with the results from this state-of-the-art overview to identify previously overlooked contextual factors that were identified with our proposed ANT-approach to show the added value of such a perspective.

T_05 ENVIRONMENT AND CLIMATE (A) / 1760**Nature's renaissance: rethinking brownfields through ecological regeneration**

Author: Sara Piccirillo¹

Co-authors: Rosaria Iodice¹; Benedetta Pastena¹

¹ *Università degli Studi di Napoli Federico II - Dipartimento di Architettura*

Corresponding Authors: sara.piccirillo@unina.it, rosaria.iodice@unina.it, benedetta.pastena@unina.it

How can the spontaneous renaturation of brownfields contribute to sustainable urban regeneration while integrating ecological, social, and economic objectives? The study examines the potential of spontaneous renaturation in brownfields, with the purpose of valorising the ecological regeneration methodology.

The rapid deindustrialisation of the 20th century left behind a vast number of brownfield sites, profoundly reshaping urban landscapes across the world (Adams et al., 2010). Often characterised by environmental contamination and degradation, brownfields have contributed to socioeconomic decline (Mikelbank, 2008), reflecting broader demographic and planetary urban shrinkage trends. Furthermore, both human and non-human populations are impacted by their ecological degradation, which has serious health repercussions (Bambra et al., 2014). Despite these challenges, brownfields present a strategic opportunity for sustainable urban redevelopment (Jacek et al., 2022).

In line with European directives, such as the EU Soil Strategy 2030 and the EU Biodiversity Strategy 2030, brownfields have often been redeveloped to contain urban sprawl and

limit land consumption. Their transformation, however, has mainly served commercial and residential purposes (Preston et al., 2023). Nevertheless, given the ongoing global environmental crises, it is imperative to re-think these spaces as ecological resources (Graham & Healey, 2017). Land consumption and biodiversity loss, two of the main consequences of uncontrolled urban sprawl and human activities, weaken the capacity of cities to sustain resilient ecosystems and exacerbate their vulnerability. Ecological regeneration of brownfields is therefore crucial for sustainable urban planning reducing environmental impacts while fostering livable and adaptable cities.

In this context, the contribution explores how brownfields that have developed an intrinsic ecological value over time can be preserved and integrated into urban development, shaping regeneration projects in synergy with ecological preservation and fostering urban resilience. Brownfield ecological regeneration is not only a response to environmental challenges but also an opportunity to innovate urban design on a global scale (Kirkwood, 2001): classic remediation approaches are often too costly, time consuming and have high impact on the economics of the project, so much that they are themselves a constraint on the realization of transformations. Moreover, traditional remediation techniques and regeneration strategies frequently pursue invasive interventions focused solely on contaminant removal, aiming to restore an idealised “clean” condition — often neglecting subsequent urban development contexts. Rethinking these processes raises the question of whether spontaneous renaturation offers an added ecological value. Observing natural ecological evolution and regeneration in brownfields could inspire sustainable urban design strategies that reconcile city development with emergent territorial dynamics.

Through the comparative analysis of three case studies the paper analyses the motivations behind the choice of strategy and explores the environmental, social and economic reasons why it may be a preferable solution in certain circumstances. Focusing on the potential value deriving from more natural management of contaminated sites and its integration into urban policies—despite significant differences in regulations and practices internationally—the contribution does not seek to provide a universal assessment but to extrapolate the logic and potential of this type of regeneration. This investigation is part of the PE3 RETURN research project, funded by the National Recovery and Resilience Plan - Spoke TS1, Task 5.4.4 “Towards a circular metabolism for urban and metropolitan settlements”.

The selected case studies—Liberty State Park (Jersey City, USA), Gas Works Park (Seattle, USA), and La Goccia Park (Milan, Italy)—illustrate how local communities, in collaboration with urban planning initiatives, can transform brownfields into functional ecological resources. Particular attention is given to the interaction between ecological and urban needs and how these can be reconciled in degraded areas redevelopment. Recent studies suggest that spontaneous renaturation is both an environmental asset and a powerful tool for strengthening social cohesion (Graham & Healey, 2017).

The Thresholds of Urban Parks' Characteristics on Heat Mitigation Effect—Case Study of 120 Parks in Foshan, China

Author: Lihua Chen¹

Co-author: Jing Gan¹

¹ *Tongji university*

Corresponding Authors: 2410354@tongji.edu.cn, jinggan@tongji.edu.cn

In the context of the increasingly severe global environmental crisis, where the urban heat island effect is seriously eroding the ecological health of cities and threatening human well-being, it is extremely urgent to deeply explore the cooling mechanism of urban green spaces. (Farshid, 2019; Lin, 2021). Urban green spaces are crucial for alleviating urban overheating and play a vital role in achieving sustainable urban development if planned and utilized effectively (Soltanifard H, 2024). This research aims to address the following key questions: How to accurately assess the cooling capacity of urban parks in water network cities? How to determine the key factors and their thresholds that affect the cooling effect of parks? And how to formulate reasonable planning strategies based on the cooling performance of parks? This research focuses on the unique Lingnan water network cities in the southern China. Foshan, being a typically rapidly developing city in the Lingnan region, confronts representative environmental problems during its urbanization process, thus making the performance of its urban green spaces in coping with the heat island effect highly worthy of in-depth study.

This research takes 120 urban parks as example, aiming to comprehensively assess their cooling capabilities. To achieve this, four indicators are introduced: Park Cooling Area (PCA), Park cooling efficiency (PCE), Park cooling intensity (PCI), and Park cooling gradient (PCG) (Sun, 2024). Using the multi-ring buffer analysis tool in ArcGIS Pro, the surrounding area of each park is divided into 30 concentric buffers (extending to 900 meters), and the average temperature of each buffer is analyzed to comprehensively evaluate the cooling capacity of the park, with a particular focus on exploring the application of the law of diminishing marginal utility of cooling efficiency (Farshid, 2019; Lin, 2021).

The study is divided into five steps. First, the cooling performance of different park types is compared to determine the most effective park type (Chander, 2009; HEALEY, 2005). Second, the spatial landscape characteristics of urban green spaces are analyzed from three dimensions: morphology (covering park area, perimeter, landscape shape index, and normalized difference vegetation index), structure (such as water surface area ratio and blue-green space proportion) (Chen, 2014), and distribution (including the aggregation degree of ecological patches and water bodies). Thirdly, the Boosted Regression Tree (BRT) model is used to quantify the contribution of parks to reduce the land surface temperature under the combined influence of multiple environmental elements (Han, 2022). Fourthly, the marginal effect threshold of park characteristics on cooling is measured, and the nonlinear relationship between these factors and cooling benefits is elucidated (Friedmann, 2004; Zhang, 2024). Finally, the Geographically Weighted Regression (GWR) model is used to cluster the parks based on their cooling performance. The results are quite enlightening. (1) In summer, despite the significant urban heat island effect, urban parks still play a significant role in cooling. From a spatial perspective,

the cooling effect gradually weakens from the suburban green belt to the city center. (2) The key determinants of the cooling effect include park area, distance to the riverbank, and the proportion of blue-green space within the park. (3) Notably, green infrastructure exhibits threshold effects, and specific marginal values are determined for park area, normalized difference vegetation index, water surface area ratio, distance to the riverbank, and ecological patch aggregation degree. (4) These 120 parks are divided into five different categories based on their cooling-dominated factors.

This research not only enriches the theoretical understanding of the cooling role of urban green spaces but also provides practical insights for optimizing the planning, layout, and design of green infrastructure, thereby contributing to strengthening urban climate regulation and promoting sustainable urban development.

Airscapes: Understanding Urban Air Quality Through Data-Driven Mapping

Author: Dakota McCarty¹

¹ *George Mason University*

Corresponding Author: dmccar6@gmu.edu

As cities continue to face the challenges of climate change and environmental degradation, understanding the spatial variability of urban air quality is essential for fostering sustainable and resilient development. Air pollution, a critical determinant of public health and environmental well-being, is especially problematic in high-density urban environments where complex interactions between the built and natural landscape drive its dynamics (Liang & Gong 2020). Yet, traditional air quality monitoring methods often fall short, relying on sparse or elevated sensor placements that fail to capture pollution

at the “human level” (Hoek et al. 2008). This study addresses these limitations by developing a novel methodology for high-resolution spatial mapping of air quality in Songdo, South Korea, using an integrated approach that combines low-cost sensor networks (Jayaratne et al. 2020), Gaussian Mixture Models (GMMs), and Computational Fluid Dynamics (CFD) simulations.

Key pollutants, including PM_{2.5}, PM₁₀, and NO₂, are measured through a dense network of strategically deployed sensors covering diverse urban contexts such as residential zones, traffic corridors, and green spaces. Advanced spatial interpolation techniques are used to identify nuanced patterns in pollutant concentrations, while CFD simulations model the interaction between urban morphology, wind dynamics, and pollutant dispersion (Guo et al. 2021). The resulting high-resolution maps reveal localized pollution hotspots and the factors driving air quality disparities at a granular level.

Preliminary findings highlight the significant influence of urban design on air quality. For instance, dense building configurations and narrow streets can trap pollutants, creating “canyon effects” (Guo et al. 2021), whereas strategically placed green spaces and open corridors enhance airflow and reduce pollutant concentrations (Łowicki 2019). These insights underscore the critical role of urban planning in mitigating pollution exposure and improving public health outcomes.

By combining advanced computational tools with cost-effective, scalable monitoring systems, this study overcomes the limitations of traditional air quality assessment methods. The detailed maps generated provide actionable insights for policymakers and urban planners, enabling targeted interventions to mitigate air pollution and enhance urban livability. The methodology also emphasizes the importance of addressing environmental justice by identifying and alleviating pollution burdens that disproportionately affect vulnerable communities (Manisalidis et al. 2020).

This research advances the understanding of urban air pollution dynamics and provides a scalable framework that other cities can adopt to assess and manage air quality challenges. Bridging scientific innovation with practical application, the findings offer a valuable resource for creating healthier, more equitable, and more resilient urban environments.

Urban Polarization: A Barrier to Carbon Neutrality

Authors: Jiyong Park¹; Seunghyun Jung¹

¹ *Korea Institute of Civil Engineering and Building Technology*

Corresponding Authors: jyxnq@kict.re.kr, shjung@kict.re.kr

Research Background

Urban and regional carbon neutrality is fundamentally a sustainability issue (Park, 2023). Carbon neutrality cannot be deemed successful if it results in economic decline or diminished social equity. Fossil fuel-based energy systems are inherently incompatible with growth models that promote sustainable development. Consequently, considerable attention has been devoted to energy transitions aimed at reducing greenhouse gas (GHG) emissions. However, the issue of social equity has received comparatively less attention than climate change adaptation agendas, such as urban hazard mitigation. Achieving carbon neutrality inevitably transforms the socioeconomic fabric of cities, which may either enhance or undermine social equity. Therefore, it is imperative to understand how urban disparities influence the pursuit of carbon neutrality.

Method

The purpose of this research is to assess the impact of intra- and inter-urban disparities on greenhouse gas emissions. A multilevel model was developed using data from metropolitan and basic local governments in South Korea. Two primary data were utilized. GHG emissions were analyzed using data from the National Greenhouse Gas Inventory Center of South Korea, while case studies were conducted using data from the Ministry of Land, Infrastructure, and Transport's Carbon Spatial Map (carbonmap.kr). The spatial information provided by the Carbon Spatial Map enabled a more detailed and nuanced multilevel analysis.

To measure urban disparities, key variables were selected, including GRDP per capita, local income tax per capita, life expectancy, the ratio of beneficiaries of national basic livelihood, and the proportion of budgets allocated to carbon neutrality initiatives. Additionally, the impact of urban spatial structures was examined through the development of the Urban Compactness Index (UCI). The UCI comprises four components: Development Density, Land Use Mix, Activity Centering, and Street Accessibility. Variables such as employment density were used for Development Density; building use diversity and job mix were applied for Land Use Mix; regional Global Moran's I was used for Activity Centering; and plot coverage ratio was employed for Street Accessibility.

Results

The analysis revealed that while the impact of urban disparities and spatial structures on per capita emissions was minimal at the basic local level (141 cities in South Korea), significant differences were observed at the metropolitan level. Regions with lower local income tax per capita and a higher ratio of beneficiaries of national basic livelihood exhibited higher per capita emissions in the building and transport sectors. Regarding urban spatial structures, higher values of Land Use Mix and Activity Centering were associated with lower per capita emissions. Intra-urban disparities were most pronounced in Seoul, Busan, and Daegu. Inter-urban disparities varied by city size; cities with populations exceeding 1 million exhibited minimal disparities, whereas small and medium-sized cities with populations under 500,000 demonstrated significantly higher per capita emissions.

Policy Implications

South Korea's legislative framework mandates carbon neutrality goals to be achieved at the basic local level. This framework emphasizes accountability at the city level to meet the nation's carbon neutrality targets. However, intra- and inter-urban disparities present significant barriers to implementing these policies. For instance, cities lacking public transportation systems face greater challenges in reducing transport-related GHG emissions compared to other municipalities. Addressing both intra- and inter-urban disparities can yield greater benefits for achieving carbon neutrality. Additionally, ensuring the maximum utility for the most disadvantaged regions aligns with the principles of sustainable development. Therefore, to achieve the national carbon neutrality goals

through urban and regional initiatives, it is essential to minimize disparities while advancing carbon neutrality policies.

Funding

This work was supported by the Korea Agency for Infrastructure Technology Advancement (KAIA) grant funded by the Ministry of Land, Infrastructure and Transport (Title: Development of Planning Support Technology based on Carbon Spatial Map, Grant RS-2023-00242291).

Providing Strategies for Sustainable Cities by Comparing the Carbon Sink Benefits of Blue and Green Spaces: Evidence Based on Multiple Sources of Data

Author: zhihan ZHANG¹

Co-authors: yuyue HUANG¹; xun ZHANG¹; qingxin YANG¹; junyan YANG¹

Cities are a major source of carbon emissions, and in a time of frequent extreme weather, how to realize sustainable urban development through emission reduction and sink enhancement has a bearing on the fate of mankind globally. Urban blue-green infrastructures have outstanding carbon sink benefits and potentials and are the baseline ecological carriers for carbon sequestration and sink enhancement in cities. However, with the rapid expansion of cities, the destruction of nature by cities has led to the phenomenon of the fracture and fragmentation of blue-green infrastructures, which in turn has led to a significant reduction in their carbon sink benefits. Relevant scholars have carried out in-depth research on this issue, but the current research, on the one hand, separates blue infrastructure and green infrastructure and discusses them separately, ignoring the comprehensive benefits of blue-green infrastructure. On the other hand, the measurement of the carbon sink efficiency of blue-green infrastructure is also limited by low data precision, fuzzy measurement boundaries, and complex influencing factors, which makes it impossible to accurately identify the carbon sink efficiency of the space. Therefore, exploring scientific, high-precision carbon sink measurement methods and integrating natural elements such as water bodies and green spaces in cities is an important direction for current research.

In this study, we take blue-green infrastructure as the research object and climate suitability as the target and discuss the overall carbon sink benefit and its influencing factors under the coupling of green space, vegetation, water systems, and soil in the city in a comprehensive way. Firstly, by combining macro satellite remote sensing data and micro field research data, the limitations brought by single data are compensated, and the

scientificity and feasibility of the study are enhanced. Based on this, the spatial distribution map of carbon sink elements of blue and green infrastructures was constructed and visualized by ArcGIS. Secondly, the quantitative calculation of carbon stocks in green areas, water systems, and soils was carried out by carbon sink coefficients, and the carbon sink benefits of blue infrastructures and green infrastructures were discussed and reconciled with the score in a holistic perspective. Again, we constructed a linkage model between carbon sink benefits and blue and green infrastructure and further discussed what influences the carbon sink benefits of blue and green infrastructure. Finally, based on the above analysis, we propose optimization strategies for urban blue-green infrastructure for climate suitability objectives.

It is found that there are spatial differences in the distribution of carbon sinks of blue-green infrastructure in Nanjing's river-reading building area, and that the spatial aggregation of blue-green elements and the area of green space are the main factors affecting the carbon sink benefits. Further analysis shows that trees are the main vegetation type to enhance the carbon sink capacity. In addition, we propose optimization strategies for urban blue-green infrastructure from the levels of spatial pattern and blue-green elements and enhance the comprehensive benefits of carbon sinks by optimizing the plant communities in the space, widening the area of waterfront green space, and the reasonable ratio of blue-green space, with a view to improving the quality and efficiency of the comprehensive carbon sink benefits and ecological resilience of the city, so as to enhance the spatial climatic appropriateness and provide a solution path for the city to cope with global warming and promote the sustainability of the city. In this way, we can improve the climate suitability of the space, provide a solution path for the city to cope with global warming, and promote the sustainable development of the city.

Climate Gentrification in Florida: Perspectives from City Officials, Housing officials and Advocates in Tampa and Miami

Author: April Jackson¹

Co-authors: Anthony Milordis ²; Tisha Holmes ²; William Butler ²

² *Florida State University*

Corresponding Authors: wbutler@fsu.edu, acm11h@my.fsu.edu, ttholmes@fsu.edu, ajacks29@uic.edu

“Climate gentrification” is the new turn of phrase used to highlight the disproportionate impacts of climate change on low-income populations of color. Sea level rise threatens to dramatically reshape life on the Florida coast. As waters breach the tops of sea walls and bubble up from below, they erode the risk tolerance of wealthier residents to remain on the coast as inundation becomes more permanent than a nuisance. Consequently, higher elevation neighborhoods are increasingly primed to become gentrification hotspots through speculation and permissive development incentives for migrating populations facing eventual retreat from the coast. The process of inland retreat may also lead to secondary displacement of long-term residents as the pressures of gentrification, investment and development take hold particularly in lower income communities of color. While there is growing attention to the potentials for mass migration and retreat from the coast, there is limited empirical analysis of the dynamics of displacement related to sea level rise and the planning mechanisms in place to manage impending neighborhood change in higher elevation communities.

This paper examines the planning efforts to address the risks of first order displacement from the coast related to sea level rise impacts and mitigate second order displacement in low income inland communities on higher ground. We employ a multi-staged research design to explore how major urban centers in Florida are planning for and developing policies to address the disproportionate impacts that marginalized communities are likely to experience in the face of sea level rise. The three stages of the research methodology include 1) mapping of displacement risk indicators, 2) a modified network of plans policy analysis, and 3) semi-structured interviews conducted with key resilience, housing, and planning actors in Miami and Tampa Bay regions.

This paper draws from our policy analysis and interviews with city officials, housing officials, and advocates. We find through the plan analysis there is a disconnect between resilience and environmental policies concerned about the effects of sea level rise and housing protection policies used to manage neighborhood change and prevent displacement. Likewise, our interviews show that all regions are operating in a pro-development political context and as long as property values remain high, the misalignment in timelines of developers working on short-term returns with the realities of the eventual long-term implications for these new developments on the coastlines will persist. In inland communities for each region, we find ongoing tensions between the interplay of revitalization initiatives and neighborhood preservation, where communities that receive upgrades, urban greening or flood proofing witness increasing property values and become targets for displacement of existing residents.

Local variations across the comparative cases reveal divergences in the salience of climate displacement perceptions and responses. In Miami-Dade areas that are primed for potential displacement are explicitly identified as inland communities of color which are already undergoing neighborhood change. In Tampa Bay-Pinellas, planners are in the process of understanding the vulnerabilities related to sea level rise, sources of affordable housing stock and identifying potential areas where primary and secondary displacement may occur.

This paper advocates for a more anticipatory model of planning and proactive examination of climate planning and housing policies focused on anti-displacement strategies to identify gaps in coverage and opportunities to promote greater equity and address the risks associated with first order and second order displacement.

The Expansion of High-Tech Zone Development and Regional Carbon Emissions: A Synergistic Exploration of Spatial Heterogeneity and Environmental Justice

Authors: Yuanhong Qiu¹; Ting Zhang²; Yuequn Cao³

¹ *Chongqing University*

High-tech development zones (HTDZs) play a critical role in driving economic growth and technological innovation, but their rapid development also poses significant challenges to regional carbon emissions. This study focuses on 168 HTDZs in China, aiming to explore the dynamic relationship between the expansion of development scales and regional carbon emissions. The research seeks to address two key questions: How does the development scale of HTDZs influence regional carbon emissions? And what spatial heterogeneities and environmental justice implications arise from these interactions? To answer these questions, this study adopts a comprehensive methodological approach. Data on inputs, outputs, and innovation performance were collected for each HTDZ. The entropy method was employed to construct a development scale index, providing a robust measure of HTDZ growth. Coupling coordination models were used to assess the synchronization between HTDZ development and carbon emissions, while geographically weighted regression (GWR) models were applied to identify spatially varying relationships and uncover underlying mechanisms. The findings reveal a complex and heterogeneous relationship between HTDZ development and carbon emissions. HTDZs with higher development scales often benefit from economies of scale and advanced green technologies, resulting in a relatively lighter carbon emission burden. In contrast, less developed HTDZs face disproportionate environmental risks, as their limited technological and financial capacities hinder their ability to adopt low-carbon practices. Additionally, the spatial heterogeneity analysis indicates significant regional disparities: coastal HTDZs tend to exhibit better coupling between development and emissions reduction, while inland and economically underdeveloped HTDZs struggle with higher carbon intensities. This study contributes to the literature by highlighting the dual effect of HTDZ expansion on regional sustainability. On one hand, HTDZs are engines of economic growth and innovation; on the other, they exacerbate regional disparities in carbon emission burdens. The findings underscore the need for differentiated policy interventions that account for local contexts. Specifically, policies should prioritize targeted support for underperforming HTDZs, promoting equitable access to green technologies and fostering collaborative regional governance. In conclusion, this paper proposes a framework for integrating environmental justice into sustainable planning for HTDZs, emphasizing the importance of balancing economic development with

environmental responsibility. The insights from this study provide theoretical underpinnings and practical guidance for policymakers, offering actionable strategies to advance the low-carbon transition of HTDZs and contribute to broader regional carbon neutrality goals. This research offers a valuable perspective on the intersection of urban planning, environmental economics, and climate policy, making it highly relevant to sustainable development agendas globally.

Deep Learning-Based Building Energy Consumption Prediction Model Considering Occupant Density Using Mobile Network Big Data: A Case Study of Seoul

Authors: Havva Elmali¹; Seung-Nam Kim¹

¹ *Chung-Ang University*

Corresponding Authors: snkim@cau.ac.kr, havva.elmali@outlook.com

In today's world, the rapidly increasing urban population and the corresponding rise in energy demand have made optimizing energy consumption in buildings a critical issue for urban planners and policymakers. Traditional energy consumption prediction models typically focus on static building features and environmental factors, yet they may not fully capture the influence of population density in the surrounding area. However, the relationship between building design, urban form, and energy consumption is complex, with user behavior playing a decisive role in energy consumption patterns (Holden & Norland, 2005). This study aims to overcome the limitations of traditional models by incorporating user density data into energy consumption prediction models through machine learning techniques, providing more accurate predictions for various building types across Seoul.

The research analyzes hourly mobile user data from 50m x 50m grid areas across Seoul to investigate the impact of fluctuations in occupant density on energy consumption. Using data from 2013 to 2023, the study integrates real-time occupant density data alongside static building features and environmental conditions into energy prediction models to improve prediction accuracy. The research proposes an activity-based building classification, recognizing the differences in usage patterns across various building types. For instance, energy consumption in residential buildings tends to increase during nighttime hours, indicating a correlation with the nighttime population. In contrast, energy consumption in commercial buildings peaks during working hours, reflecting their dependence on daytime activities. Public buildings, on the other hand, exhibit varying occupant density profiles throughout the day. These diverse density patterns are expected to contribute to more accurate energy consumption predictions.

The dataset used in the study not only reflects changes in user density throughout the day but also enables more precise predictions of building usage types and energy consumption profiles. This approach goes beyond traditional models to achieve higher accuracy in energy consumption predictions. Notably, a similar study by Diao et al. (2017) demonstrated that incorporating occupant density data significantly improved energy prediction models. In this context, the research highlights that traditional land use classifications may lead to inaccuracies in energy prediction models due to the dynamic nature of urban activities. By offering an activity-based classification system, this research proposes a more advanced method for understanding and optimizing energy consumption in urban areas. This approach aligns with Santos et al.'s (2019) work on utilizing urban mobility data in energy prediction models.

The research methodology includes the use of Long Short-Term Memory (LSTM) networks for time-series forecasting and Cluster Analysis for activity-based building classification. Additionally, regression models will be employed for statistical analysis to isolate the impact of user density on energy consumption and understand the relationships between variables. These analyses will provide a more detailed evaluation of factors such as building age, type, and environmental conditions on energy consumption.

The findings from this study are expected to contribute to more efficient and targeted

urban energy planning and policies. Accurately analyzing the impact of fluctuations in occupant density on energy consumption can provide a significant advantage in developing energy-saving strategies. Integrating dynamic human activities and user density data into energy prediction models offers an innovative approach to deep learning-based urban energy optimization. This method can enhance the efficient management of energy distribution systems and support the development of sustainable energy policies in cities.

Accounting Beyond Boundaries: Exploring consumption-based carbon approaches in Paris and Gothenburg

Author: Eloise Deshayes¹

Co-author: Will Brown²

¹ *Universitat Internacional de Catalunya*

² *University of Cambridge*

Corresponding Authors: edeshayes@uic.es, wghb2@cam.ac.uk

As cities increasingly commit to achieving carbon neutrality, they engage in greenhouse gas (GHG) inventories to measure their emissions. These inventories are typically guided by international frameworks, such as the Global Protocol for Community-Scale Greenhouse Gas Emission Inventories (GPC), and primarily rely on production-based accounting (PBCA). This approach focuses on emissions produced within the city boundaries. However, a growing body of literature highlights the limitations of PBCA, emphasizing that it captures only a partial view of urban emissions (Lombardi et al., 2017; Millward-Hopkins et al., 2017). These scholars support a shift towards consumption-based carbon accounting (CBCA), which considers emissions embedded in goods and services consumed within cities, regardless of their production location.

This transition is deemed critical mostly for Western cities, where production-based emissions are declining while consumption-based emissions are projected to increase

(Harris et al., 2020; Sudmant et al., 2018). Furthermore, production-based mitigation efforts might be offset by the rise in consumption emissions (Millward-Hopkins et al., 2017). Overall, CBCA is considered to offer a more comprehensive and equitable framework for addressing urban GHG emissions, incentivizing the adoption of policies that promote less carbon-intensive consumption and the reduction of carbon leakage processes (Grasso, 2016). In policy circles, international networks such as C40 are increasingly acknowledging the role of cities in global consumption emissions and advocating for their reduction.

However, existing studies predominantly address methodological issues, such as data collection and calculation techniques (Yin et al., 2022), and research on the governance and political dimensions of CBCA at the city level remains scarce. Research in this area has primarily been conducted at the national level (Grasso, 2016), leaving a critical gap in understanding the local governance conditions to account for and tackle consumption-based emissions. Therefore, this article aims to address that gap by investigating the governance and political conditions necessary for developing CBCA in cities, using Paris and Gothenburg as case studies. Both cities have established ambitious consumption-based emissions targets and corresponding strategies to address them.

The research employs a mixed-method approach, combining desk research, qualitative analysis of cities' official documents, and in-depth interviews with city officials. Preliminary findings reveal several key governance factors driving the adoption of a CBCA. First, national-scale institutions, including research organizations and government agencies, play a pivotal role by providing cities with data, standards, and methodologies. Despite some methodological struggles, these contributions enhance the legitimacy of urban efforts to address consumption-based emissions. Second, the cases demonstrate a high awareness among policymakers about the embodied emissions associated with urban consumption and their global impacts. This awareness is, in part, linked to a historic commitment to climate mitigation. Third, embedding numerical consumption-based targets within climate plans, along with the development of sector-specific roadmaps, are critical enablers to ensure the accounting and tackling of these emissions in the long term. To do so, the development of partnerships with the local private sector emerges as a key strategy to tackling emissions which are outside of municipal jurisdiction.

The study provides a valuable insight into the governance conditions required for CBCA implementation and highlights the best practices from leading cities. These findings can inform the development of CBCA approaches in cities and support institutions such as international city networks.

Participatory Methods for Climate-Resilient Urban Development: Case Studies from Finnish Municipalities

Authors: Outi Tahvonen¹; Tommy Lindgren²; Hossam Hewidy³

¹ *Principal Research Scientist, Häme University of Applied Sciences*

² *Lecturer, Aalto University, Dept. of architecture*

³ *Senior Lecturer/Aalto University*

Corresponding Authors: tommy.lindgren@aalto.fi, outi.tahvonen@hamk.fi, hossam.hewidy@aalto.fi

Adapting urban planning practices to mitigate and respond to the impacts of climate change is an urgent global challenge. In Finland, urban typologies and planning practices significantly influence the amount and structure of residential greenery (Leppänen et al., 2024). For instance, single-family housing areas, which dominate urban land use in many Finnish regions, present unique opportunities and challenges for integrating climate resilience into urban planning. These areas offer potential—or pose challenges—in implementing vegetation-integrated stormwater management, enhancing habitat diversity, and supporting ecological networks (Tahvonen, 2018). This article examines the role of workshops as participatory methods for fostering innovation in climate-resilient planning, with a focus on two workshops conducted in collaboration with municipal planners in the Finnish municipalities Pori and Joensuu.

Part of the Climate-Resilient Single-Family Housing Areas (ILPI) project, the workshops aimed to evaluate the applicability of three planning tools: green factor metrics, limits on impermeable surfaces, and the 3-30-300 guideline. These tools seek to balance urban densification with vegetation preservation and biodiversity enhancement. The process integrated theoretical discussions with practical site visits to small-scale housing areas, enabling participants to contextualize planning challenges and develop locally tailored solutions. Stakeholder participation in adaptation planning is often conducted through structured workshops, which organize both the content (e.g., data and information) and the process (tasks, steps, and interactions) (McEvoy et al., 2018).

Key insights from the workshops included the value of incorporating local knowledge into planning processes, particularly in identifying site-specific barriers to implementing climate-resilient measures. The collaborative format encouraged critical reflection on existing practices and co-development of innovative strategies for enhancing the ecological character of single-family housing areas. Small-scale interventions, such as permeable paving and strategic vegetation placement, emerged as practical solutions for managing stormwater, mitigating urban heat islands, and enhancing biodiversity.

Interdisciplinary collaboration proved essential. By engaging planners, environmental experts, and other stakeholders, the workshops fostered a comprehensive understanding of the interplay between urban design, environmental resilience, and community well-being. Site visits grounded theoretical discussions in tangible contexts, offering examples of the challenges and opportunities in achieving climate resilience within single-family housing areas. Field observations highlighted the predominance of impermeable surfaces, often driven by car parking requirements, at the expense of green space.

The findings suggest that workshops can serve as effective tools for creative innovation in urban planning, especially in addressing the multifaceted challenges of global warm-

ing. Field observations highlight the essential need to educate households on the importance of permeable surfaces to facilitate the transition from grey to green spaces. However, the study identifies areas for improvement, such as establishing clearer frameworks to translate workshop outcomes into actionable policies and ensuring sustained collaboration beyond workshop settings.

This article contributes to the growing research on participatory planning methods by documenting experiences from Pori and Joensuu. It provides valuable insights for practitioners and researchers aiming to integrate innovative approaches into the planning and design of single-family housing areas. Ultimately, the study highlights workshops' potential to bridge the gap between global climate goals and local planning practices, offering a replicable model for addressing critical environmental challenges.

The Socio-ecological Transformation: A Class Question?

Author: Johanna Gassner¹

¹ *Technische Universität Wien*

Corresponding Author: johanna@raumlink.at

This paper revisits the class question in the context of socio-ecological transformations. More specifically, it examines how socio-spatial analysis understood as a method can better respond to both social and ecological conditions. Socio-spatial methods have been widely applied in the redesign of public spaces. They are often used as a basis for competitions, planning processes, and participatory practices. Socio-spatial analysis comes in various forms, yet it often lacks depth and thus fails to capture the multi-layered nature of social space, particularly in terms of class. To address the class dimensions of space adequately, this paper suggests to consider social relationships and practices that, in the Bourdieusian sense, are “inscribed” in specific places, yet that also reflect and reinforce existing, translocal social hierarchies (Bourdieu 1979). This deeper consideration is essential to understand who participates in planning processes, who is excluded, who uses public space and has access to it and who does not. It is also critical for understanding the social behaviors that emerge within different groups and societies. Environmental challenges, especially climate change, disproportionately affect marginalized, low-income, and vulnerable communities, which have contributed the least to the crisis yet suffer its harshest impacts.

In this light, the class question becomes even more pressing, particularly in relation to the multiple crises currently affecting spatial planning. Socio-spatial analysis offers a crucial tool for critically reflecting on and uncovering the different power relations and

structures of domination that shape spatial development. This analysis, in turn, is vital for addressing socio-economic and socio-spatial inequalities. The guiding question of the article thus becomes: What class-specific dimensions and criteria should be integrated into socio-spatial analysis to make it a critical planning tool? This question is particularly relevant in the context of socio-ecological transformation, where understanding the intersections between class and environmental change is crucial.

This paper is conceptual in nature and draws on contemporary class theories to identify criteria for reforming socio-spatial analysis understood as a method. A key example of this approach is Klaus Dörre's work, in which the relevance of both the socio-ecological crisis and class conflict is particularly prominent. By exploring these connections in different current class theories, the paper aims to eliminate the "class blindness" that often characterizes the socio-spatial analysis and design of spatial transformations.

Receiving Communities During COVID-19: Lessons for Climate Migration

Author: Omur Damla Kuru¹

Co-authors: Paromita Shome²; Elisabeth Infield²; Henry Renski²; Emily Hodos²

¹ University of Utah

² University of Massachusetts, Amherst

Increasing climate impacts motivate migration across the globe (United Nations Network on Migration 2024). Although climate-induced migration is projected to impact US communities, literature on the numbers, locational choices of the movers, and implications for receiving communities is scarce. This study, focuses on recent population mobility towards rural areas in Northeast (NE) Region in the United States and explores *whether climate-induced migration is evident in rural NE*. Based on the recent population mobility in the area, this research also uncovers *what infrastructure-related and socioeconomic outcomes can be expected in receiving communities*, if climate-induced migration pushes populations towards rural (inland) Northeast, as suggested by projections (see for example Robinson et al. 2020). It presents on-the-ground data derived from focus group participants (n=27)—local housing experts in *hotspots*, i.e., 22 rural counties of NE which experienced the highest relative numbers of in-movers between 2016-2020. The findings of this study revealed that movements were mainly driven by socioeconomic and technological changes, catalyzed by COVID-19 that pushed urbanites towards rural areas. Although communities received a limited number of newcomers from climate-impacted areas, climate was not a major motivation for movers. The influx created significant challenges for housing market, physical and social infrastructure, and socioeconomically disadvantaged groups. COVID experience opened a window of opportunity to prepare communities for just and sustainable outcomes of future mobilities driven by hazards of many kinds. It highlighted the need to understand uncertainties—e.g., timing and amount of climate migration, by focusing on the longer horizon. Receiving communities can achieve desirable outcomes if they integrate climate migration into their plans and address existing challenges to attainable/affordable housing supply, while also enhancing climate resilience, and the integration of newcomers into host communities.

T_05 ENVIRONMENT AND CLIMATE (A) / 1500**Assessing Green Transition Initiatives: A European Comparison Perspective between Paris, Milan, and London**

Authors: Achille Ribeyron¹; Alice Dubois¹; Arthur Jeandenand¹; Etienne Eline¹; Rebekka Godsken¹

¹ Master student at SciencesPo Paris

Corresponding Authors: rebekka.godsken@sciencespo.fr, alice.dubois@sciencespo.fr, achille.ribeyron@sciencespo.fr, arthur.jeandenand@sciencespo.fr, etienne.eline@sciencespo.fr

Cities stand at the frontline of the climate crisis, and are set to transform every aspect of urban life —from sustainable mobility and energy systems to food security, water management, and inclusive housing. As places of both vulnerability and innovation, they offer great potential for redefining urban living by implementing bold, forward-looking solutions. Among them, housing has emerged as a critical focus, given its role as a highly climate-exposed and energy-consuming sector. Our work lies in examining trade-offs and relationships between Environmental and Energy Policies (EEPs), and housing challenges through a comparative approach across different European contexts.

This project is conducted as part of the master's programme "Governing Ecological Transitions in Cities" at the Urban School of SciencesPo Paris, in partnership with AESOP. It is developed in collaboration with the French team working on the European research project ReHousIn, which examines the interconnections between housing, social inequalities, and urban environmental transitions.

The first objective of our research is to map EEPs alongside socio-economic indicators to assess the current state of Paris and the potential for green gentrification. The analysis focuses on three types of EEPs: (1) Nature-based Solutions, i.e., actions inspired by or modeled after nature to address urban challenges; (2) Energy Retrofitting, i.e., renovation work within residential buildings, including heating, cooling, ventilation and renewable energy integration; (3) Urban Densification, i.e., policies aimed at limiting urban sprawl and promoting sustainable urban growth. The cartographic representation of both EEPs and socio-economic indicators in Paris reveals three key trends. First, Paris is prone to green gentrification due to the lack of control on the private housing market, as rent prices are consistently higher near major green and blue spaces, even in poorer neighborhoods (map 1). Second, citizen-led initiatives are more prevalent in low-income areas (map 2), and especially in the richest areas of the poor neighborhoods. Third, wealthier dwellings, despite similar levels of energy retrofitting as social housing, have significantly higher energy consumption due to both the rebound effect (i.e., an increase in consumption due to improved energy efficiency) and a lower population density, which increases heating demands (map 3).

The second objective of the project is to analyze and compare green transition initiatives both at the national (Orléans and Sens) and European (Paris, Milan, and London) level, focusing on their impact on housing inequalities. Paris, London, and Milan, as major European cities with distinct dynamics, provide valuable case studies for understanding how

green transitions influence housing disparities across diverse contexts. At the national level, the comparison between Paris (a large city), Orléans (a mid-sized city), and Sens (a small city) sheds light on the situation in France, revealing that the impacts of green transitions vary significantly depending on the city's size and characteristics.

The third objective of the project is to develop targeted policy recommendations to promote greater equity in urban development. Our results allow us to draft some preliminary conclusions: (1) Since the implementation of NbS tends to be a strong factor of green gentrification, in the absence of new municipal instruments to control prices on the private market, increasing green coverage in the city tends to increase the eviction process of poorer working classes. (2) As the residential energy consumption seems more related to the income of dwellers than to the quality of their insulation, energy retrofitting, while being socially useful, seems insufficient to largely reduce energy consumption in Paris. As such, our work not only contributes to the academic discourse on equitable urban transitions, but also provides practical insights for policymakers to build both greener and fairer cities.

Transforming a consolidated City into a resilient City: Lessons from Lisbon's recent strategies

Over the past decades, cities have faced increasing environmental, social, and economic challenges, which are complex to resolve not only due to its complexity but also because of the intricate chain of causes and consequences among phenomena (Hardoy and Ruete, 2013). Additionally, the adaptation of densely populated urban areas with consolidated urban fabric poses significant constraints for any strategy involving structural changes (Marchigiani & Bonfantini, 2022). Nevertheless, some cities have sought to adapt to the challenges of climate change while promoting the quality of life of the

population from an inclusive perspective, particularly for the most vulnerable communities, through a combination of intervention strategies in the city, in domains as urban mobility, green spaces, access to goods and services, etc.; and especially revaluing the local/neighborhood level.

Triggered by the AccessCity4All Project - Adapting the 15-Minute City concept to support active mobility in neighborhoods with different levels of accessibility, this paper aims to understand how a consolidated and dense city, like Lisbon (Portugal), developed an urban policy framework towards a more resilient, sustainable and inclusive city. This qualitative analysis examines recent urban planning strategies in Lisbon that promote a new city model, identifying their objectives, specific actions, goals, geographical areas of intervention, and types of interventions. According to the execution level, key findings demonstrating substantial city improvements will be identified whenever possible.

Lisbon is a paradigmatic case in the European context as a city that, in recent years, has transformed to combat growing challenges. Awarded as the European Green Capital in 2020 for its strong intervention in the area of environment and sustainability (including water management and energy efficiency, sustainable urban mobility and green areas). Beyond the environmental component, the local scale is being revalued by applying the concept of the 15-minute city, proposed by Moreno in 2016, that aims to create urban spaces where daily needs are accessible within a 15-minute walk or bike ride (Moreno, 2020; Moreno et al., 2021), continuing programs that were previously in development, such as "One Square in Each Neighbourhood", implemented to reinforce micro-centralities and upgrade public spaces for community interaction. After the emergence of Moreno's concept, one program - "There's Life in My Neighbourhood", was explicitly founded on the 15-Minute City approach, aimed to enhance neighborhood identity, quality of life, active mobility, safety, comfort in public spaces, and access to local services (Câmara Municipal de Lisboa, 2022). Consequently, beyond the commonality in the direction of various strategies towards a more resilient, sustainable, and inclusive city, and especially to accomplish the 15-minute city model, it is important to emphasize the concern for a distributive intervention throughout the city, considering the specificities and needs of each parish and community, especially those who are more socially and economically vulnerable. The combination of these strategies means that the city is committed to effective adaptation to climate change, and at the same time, seeking to increase the quality of life and well-being of the population.

In conclusion, despite the challenges that a consolidated city may face when restructuring towards a more resilient and sustainable situation, political and technical will are crucial for the implementation of the necessary strategies. In Lisbon, this intention was clearly converted into action. Furthermore, it is evident that this urban paradigm shift required a combined intervention of various domains (e.g., urban planning, transport, environment, etc.) to maximize overall outcomes, even if the outcomes of this decision will need time to manifest and be accounted for.

T_05 ENVIRONMENT AND CLIMATE (A) / 221**Analysis of the relationship between changes in greenhouse gas impacts due to changes in urban form in sub-regions of Korea****Author:** SANGWON OH¹**Co-author:** Juchul Jung ¹¹ *Department of Urban Engineering, Pusan National University***Corresponding Authors:** ohssang1006@naver.com, jcjung@pusan.ac.kr

Urban forms change as a result of economic growth and transformations aimed at maximizing economic and social benefits. In this context, the role and importance of cities that incorporate the concept of sustainable development as practical solutions to enhance the social and physical value of regions have been emphasized. As interest in sustainable and carbon-neutral cities grows due to the climate crisis, the demand for sustainable urban forms has increased. This highlights the need for growth and changes in urban spatial structures from an environmental perspective. It is therefore necessary to examine the impacts of these changes to identify environmentally favorable urban transformations. A review of previous studies reveals that understanding urban forms requires analytical methods that consider spatial similarities and interactions through density clustering and dispersion patterns among regions. However, existing methods for identifying urban centrality and measuring urban forms often fail to adequately explain spatial interactions and autocorrelation.

Moreover, most studies analyzing the effects of urban forms on greenhouse gas (GHG) emissions have focused on emissions from specific sectors as dependent variables. However, it is critical to examine the impacts of urban form changes on total energy consumption and GHG emissions. Therefore, there is a need for research that comprehensively investigates the structural and emission characteristics of cities using total regional emissions as the dependent variable, rather than emissions from specific sectors. The primary objective of this study is to examine the environmental impacts of monocentric and polycentric transformations in urban forms. Specifically, this study aims to measure urban form changes and analyze their effects on GHG emissions. The study utilizes employment data as the basis for spatial analysis to identify urban centers. To ensure detailed analysis, individual index values were used to assess urban forms and determine the degree of polycentricity. Subsequently, spatial panel regression analysis was conducted to measure the impacts of urban form changes on GHG emissions. The results of this study propose effective and efficient urban spatial structures from an environmental improvement perspective. These findings provide insights into desirable directions for environmentally-conscious urban development and management.
