Abstract: This report aims to provide a patent landscape analysis on carbon allotrope-based textile electrodes and biosensors to measure biosignals and detect several parameters. Espacenet, a free-ofcharge patent database provided by the EPO (European Patent Office) and containing data on more than 140 million patent publications from over 100 countries, was used as the reference database. The patent search was carried out by combining keywords and classification symbols. Both classification schemes (IPC-International Patent Classification and CPC-Cooperative Patent Classification) were used. As a result of this study, a total of 227 patent documents were found between 2002 and 2023. The first patent application claiming a fabric electrode arrangement with carbon black as conductive material was filed in 2002 (and published in 2004) by Philips. 2021 was the year with the highest number of published patent applications, with 36 documents. The United States was ranked first with 126 patent documents. Carbon nanotubes and graphene are the most patented carbon allotrope materials, while body temperature, motion, and heart rate measurements are the main disclosed applications. We also analyzed the Orbit database obtaining 288 patent documents (vs. 227) with only 238 still active records (148 granted and 90 pending applications): the first application by Philips on an electrode arrangement is confirmed, and the patent distribution shows a peak in the period 2016–2020 (146 records available), while today it seems to be stable or even decreasing ("only" 52 records in the half period January 2021–June 2023). This outcome suggests that this material and related technology has reached its maximum exploitation or has not demonstrated a disruptive output.

Keywords: textile sensors; textile electrodes; patent landscape; IPR; innovation

## 1. Introduction

Patent surveys and related content are deemed to be of great value for identifying R&D trends and improvements; thus, a patent landscape analysis (PLA) is a very useful tool able to provide an overview of a specific technology field and its exploitation status. PLA is a retrospective study because (almost) all patent applications are published eighteen months (or at least three months) after filing. However, since novel inventions are protected for a considerable time before related products/devices enter the market, patents can be seen as an early indicator of upcoming technologies and related systems and/or services [1].

In recent years, wearable systems and smart textiles for monitoring several biomedical parameters have been the most evolving and diffusing technologies. In this field, together with conductive fibers and fabric, another very promising material is carbon, in the form of fibers, nanotubes, or graphene layers. Its exploration and study are still under development, and no integrated surveys about this material and its application in biomedical sensing were found. This study aims to provide a PLA in the field of carbon allotrope-based textile sensors/electrodes useful for monitoring physiological signals such as heart rate (HR), SpO<sub>2</sub>, body temperature, and other bioelectrical or mechanical parameters.

## 2. Resources and Methods

Espacenet and Orbit databases were used to retrieve patent information. Espacenet (https://worldwide.espacenet.com) is a free-of-charge patent database provided by the European Patent Office (EPO) and contains data on more than 140 million patent documents from over 90 countries. Orbit Intelligence (https://www.orbit.com) is a platform managed by Questel that offers access to patent information through three patent databases (FamPat, FullPat, and FullText). The coverage of the above-mentioned tools is quite similar, in terms of the number of documents, available full text, and updates. The patent search was carried out through a combination of specific keywords and classification symbols. Both the International Patent Classification (IPC) [2] and the Cooperative Patent Classification (CPC) [3] were used.

These systems share the same hierarchical structure, but the CPC is characterized by more subdivisions (250,000 vs. 80,000). While the IPC is adopted by more than 120 patent offices around the world to classify patent applications, only 30 Offices are participating in the CPC [4]. CPC is limited to a narrow circle of countries [5]. Therefore, both systems have to be used to obtain comprehensive research [6,7]. This statement can be explained using the main group A61B 5/00 (measuring for diagnostic purposes), which is the reference classification symbol for biosensors.

This query was used on Espacenet (accessed on 7 August 2023) to obtain patents classified with IPC symbols only: ipc = "A61B5/00" NOT (cpc = "A" OR cpc = "B" OR cpc = "C" OR cpc = "D" OR cpc = "E" OR cpc = "F" OR cpc = "G" OR cpc = "H").

A total of 48,428 patent documents do not have any CPC code (see Figure 1).

Figure 1. Comparison of patent classification systems (IPC vs. CPC).

Therefore, the exclusion of the IPC would lead to a limited patent search. The classification and indexing codes (and the corresponding definitions) used for carrying out the patent searches are listed in Table 1.

Classification Code	Classification System	Definition	
A61B 5	IPC/CPC	Measuring for diagnostic purposes	
D03D 1/0088	CPC	Fabrics having an electronic function	
A41D 1/002	CPC	Garments with embedded cable or connector	
G06F 1/163	CPC	Wearable computers	
H01L 23/5387	CPC Flexible insulating substrat		
H05K 1/038	CPC	Printed circuits-textiles	
A41D 13/1281	CPC	Garments with incorporated means for medical monitoring	
A61B 2562	CPC (orthogonal indexing)	Details of sensors	
A63B 2230	CPC (orthogonal indexing)	Measuring the physiological parameters of the user	
H05K 2201	CPC	Printed circuits	
D06M	IPC/CPC	Treatment of fibers, yarns, fabrics	
C01B 32/00	IPC/CPC	Carbon compounds	
C01B 2204/00	CPC	Structure or properties of graphene	
B82Y	IPC/CPC	Specific uses or applications of nanostructures	
C08K 3/042	СРС	Uses of inorganic substances as compounding ingredients- Graphene or derivatives	
C08K 3/041	CPC Uses of inorganic substances CPC compounding ingredients Carbon nanotubes		
C01B 32/158	IPC/CPC	Carbon nanotubes	
C01B 32/182	IPC/CPC		
C01B 32/198	IPC/CPC		
C01P 2004/13	CPC (orthogonal indexing)	Particle morphology-Nanotubes	

Table 1. List of classification symbols (IPC/CPC) used in patent searches.

Classification codes are used to classify inventive or additional information, while indexing codes are helpful to categorize additional information only and to specify aspects not covered by the classification scheme. Moreover, codes are assigned according to the structure, or the function/application of the subject matter claimed in a patent.

Codes referred to function/application are the following: A61B5, D03D 1/0088, A41D 13/1281, A63B 2230, D06M, B82Y, C08K 3/042, C08K 3/041.

The classification and indexing codes listed in Table 1 were retrieved using a simple query [ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile " prox/distance < 3 "sensor?")] on Espacenet and analyzing the results through the function "Filters".

A patent search can be carried out on one or more patent databases. Usually, the collected results are different, and this depends on the specific coverage and search engine of the database.

The following query on Espacenet (accessed on 8 August 2023) (ctxt = ("textile" prox/distance < 3 "electrode?") OR ctxt = ("textile" prox/distance < 3 "sensor?")) AND ftxt = ("carbon" prox/ordered "nanotube?") yielded 110 results. The same search query on Orbit (see Figure 2) produced 154 results.

```
(C)QUESTEL

```

Figure 2. Simple search queries on the Orbit platform (FamPat database).

Therefore, a patent landscape analysis should be conducted on more than one database to obtain a more complete retrieval of documents.

#### 3. Results

Data were acquired by Espacenet and the Orbit Intelligence platform (FamPat database). The latter is provided with a comprehensive suite for searching and analyzing patent documents [8].

#### 3.1. Espacenet Results

The following search query was carried out on Espacenet (accessed on 16 July 2023) using keywords and classification symbols (listed in Table 1) in the Title/Abstract/Claims and Full-text fields for data mining of carbon-allotrope based textile sensors and electrodes:

cl any "A61B5" AND ctxt = ("textile" prox/distance < 3 "sensor?") OR (cl any "A61B5" AND ctxt = ("textile" prox/distance < 3 "electrode?")) OR (cpc any "D03D1/0088" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cpc any "A41D1/002" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cpc any "G06F1/163" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cpc any "H01L23/5387" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cpc any "H05K1/038" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cpc any "A41D13/1281" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cpc any "A61B2562" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cpc any "A63B2230" AND (ftxt = ("textile" prox/distance<3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cpc any "H05K2201" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) OR (cl any "D06M" AND (ftxt = ("textile" prox/distance < 3 "electrode?") OR ftxt = ("textile" prox/distance < 3 "sensor?"))) AND (ftxt all "graphene" OR ftxt all "carbon nanotube?" OR ftxt all "carbon black" OR ftxt all "CNTs" OR ftxt all "SWCNTs" OR ftxt all "MWCNTs" OR ftxt all "graphene oxide" OR ftxt all "reduced graphene oxide" OR ftxt all "graphene nanosheet?" OR ftxt all "carbon allotrope?" OR cl =/low "C01B32/00" OR cpc =/low "C01B2204/00" OR cl =/low "B82Y").

## [Query 1]

As a result of this study, a total of 227 patent documents were found between 2002 and 2023 (see Supplementary File Spreadsheet S1). The first patent application claiming a fabric electrode arrangement with carbon black as conductive material was filed in 2002 (and published in 2004) by Philips. 2021 was the year with the highest number of published patent applications, with 36 documents. The maximum number of patent applications

filed was in 2019 with 32 documents. The United States was ranked first with 126 patent documents, followed by China and Europe (see Figure 3). Carbon nanotubes and graphene are the most patented carbon allotrope materials (Figure 4), while body temperature, motion, and heart rate measurements are the main disclosed applications (Figure 5).

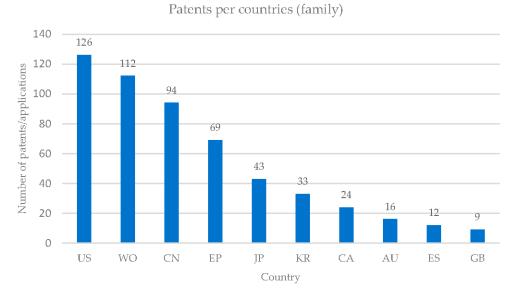

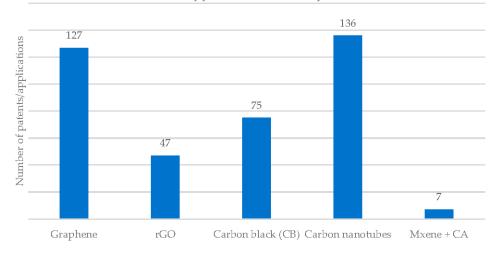

Figure 3. Top ten countries per number of published patent documents.

Type of carbon allotrope

Figure 4. Number of patent documents per type of carbon allotrope claimed.

Carbon nanotubes are the main (claimed and described) electrically conductive materials, followed by graphene, carbon black, reduced graphene oxide, and Mxenes (a group of two-dimensional transition metal carbides, nitrides, or carbonitrides with a composition of  $M_{n+1}X_nT_x$ , where M is a transition metal (Ti, V, Nb, etc.), X is nitrogen or carbon, and T is surface functional groups (-OH, -F, -O-, -Cl) [9].

The top ten applicants are reported in Figure 6.

6 of 11

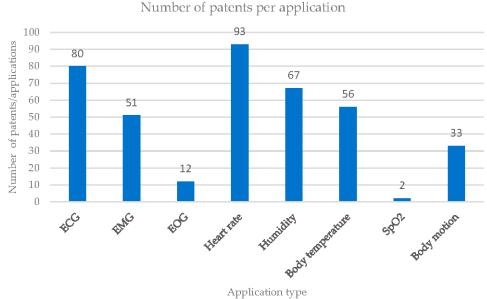

Figure 5. Number of patent documents per type of application.

Top ten applicants

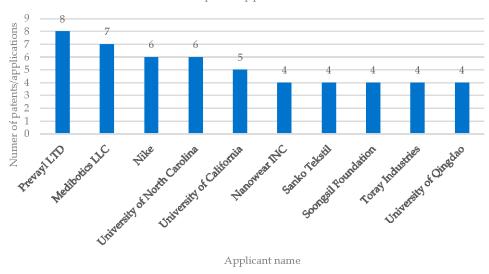

Figure 6. The top ten applicants per number of published patent documents.

Both companies and universities are listed as leading applicants per the number of published patent applications. Prevayl is ranked as the first owner, which has recorded eight patent documents. In second place, the company Medibotics has filed seven patent applications. The third place is shared between Nike and the University of North Carolina.

## 3.2. Orbit Results

The patent strategy used on the FamPat database is reported in Table 2. The patent search gave a total of 288 results, of which 238 are active patents (148 granted and 90 pending patent families, see Supplementary File Spreadsheet S2). Four patent families were litigated and nine were subjected to an opposition procedure at the EPO.

Priority, filing and publication trend

Figure 7. Trend of patent priorities, filings, and publications between 2002 and 2023.

Patents are assembled in families. A patent family is a group of patent publications on a single invention, filed by the same applicant or joint applicants in one or more countries [10].

The first application by Philips on an electrode arrangement is confirmed, and the patents distribution shows a peak in the period 2016–2020 (146 records available), while today it seems to be stable or even decreasing ("only" 52 records in the half period January 2021–June 2023).

The year 2019 has seen the maximum patent activity in priority applications filed and published patent applications.

This growing trend has been confirmed in a scientific literature search published in a recent review [11] on carbon-based textile sensors.

The patent protection, publication, and priority trends by country are reported in Figure 8. Patent families by protection country means the number of alive patents protected in the various national offices.

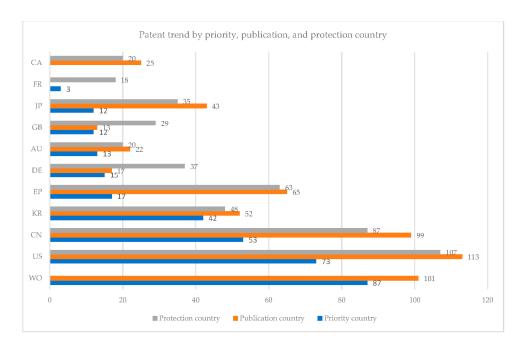

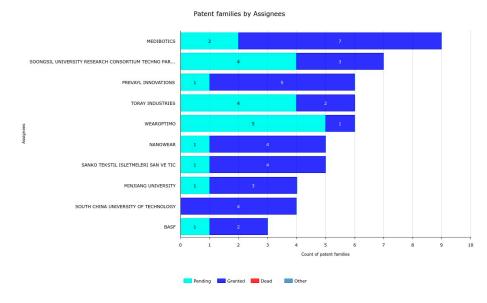

Figure 8. Patent filings trend by protection/publication/priority country.

The PCT (Patent Cooperation Treaty) procedure is the preferred solution for filing priority applications, followed by the US and China.

© Questel 2023

Figure 9. The top ten applicants per number of patents.

Medibotics ranks first with nine patent documents (7 granted and 2 pending applications), followed by a Korean foundation and Prevayl Innovations Ltd, a British company. The top ten cited patents are listed in Table 3.

Patent Number	Filing Year of the Earliest Priority	Geographical Scope of Protection	Forward Citations	Applicant
EP2404148	2008	14	8	PatienTech
EP1578482	2002	9	7	Philips
EP3116395	2015	4	6	L.I.F.E.
US11300551	2004	1 (US)	6	Rondevoo Technologies
EP2866596	2013	22	4	Smart Solutions Technologies
EP3202317	2012	7	4	Nippon T&T
WO2011103808	2010	2	4	Hong Kong Institute of Textile and Apparel
EP1814713	2004	7	3	University of Texas
US10321873	2013	1	3	Medibotics
US8191433	2008	2	3	Hong Kong Polytechnic University

Table 3. List of the top ten cited patents (see Supplementary File Spreadsheet S3).

Considering the geographical scope of protection, the number of forward citations, and the expiration dates, the most valuable patents are EP2404148 ("Elastically stretchable fabric force sensor arrays and methods of making"), EP3116395 ("Physiological monitoring garments") and EP2866596 ("Electronic textile assembly").

## 4. Conclusions

Patent documents are a valuable source of technical information that is often not available elsewhere since many companies disclose their research and development results only in patents.

Patent landscape analysis can be used to guide R&D work, to find out the most recent inventions, and to study the development of a particular technology.

Results obtained with Espacenet and Orbit are slightly different, and this is due to the different search engines of these databases.

The patenting trend since 2002 shows an increase in filing numbers starting from 2015 until 2019, with a decline in 2020 and an upswing in 2021.

Global patenting is led by the US and China, while the more promising applications are dedicated to electronic textiles applied to biomedical parameter monitoring (with particular relevance to bioelectric signals like ECG and EMG) and mechanical measurements (force monitoring through stretchable fabrics).
